CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXI—No. 1 LOS ANGELES, CAL., FRIDAY, JULY 3, 1903 Subscription $1 a Year

In Orchard and Dairy

Notes from a car window and a visit to one of the largest stock farms of the north.

NOTES BY THE WAY.

As I noted last week the observations about San Jose, will be deferred until later when an article with cuts of one of the best packing houses there will illustrate my letter.

In passing, however, I might note that the swing of things at San Jose is most gratifying to one who wishes well for all communities of this great state. Promise is given for a fine crop of prunes. The apricots are a fair crop as to quantity and excellent as to quality. The fruit is of such size and quality, that in some cases, orchard run goes to the canner. Almonds promise a big crop and cherries are ripe and going out for the East at the rate of five cars per day, at biggest prices known for years. Not bad. But that isn't from a car window.

There are four routes from San Jose to San Francisco. By way of Southern Pacific broad guage through Niles, Hayward, etc.; narrow guage nearer the east side of the bay; by small boat up the bay, with landing at Alviso within short distance of San Jose, also by Southern Pacific broad guage west of bay through Palo Alto, San Mateo, etc. I chose the latter this time. It's a beautiful ride through the thrifty orchards and gardens of San Jose, Santa Clara which are continued on through Palo Alto, Redwood and San Mateo with here and there a field spread thickly with hay cocks, and everywhere the live oaks. The farmers seem to appreciate the beauty they add to the landscape and they are spared while the plow, cultivator and mower are crowded under them as closely as possible.

San Francisco county doesn't offer much from an agricultural stand point. So we pass at once to the ferry.

Across the bay, north and west from the city, is Marin county. Its agricultural resources are not all apparent from a car window yet a ride up on the California Northwestern has much of interest. The ferry from the foot of Market street passes the big cruiser New York, a monitor and other war vessels including a hosiptal ship and transports, leaves Goat island on the right, Alcatraz with its government prison on the left and swings around Angel island to Tiburon where the train waits for us.

Marin county is pre-eminently a dairy section. Its thousand hills are covered with contented cows grazing or lying under the live oak. An occasional orchard of cherries and other fruits are passed, but the dairyman and poultrymen are most in evidence.

MARIN COUNTY LANDSCAPE

"Its thousand hills are covered with contented cows grazing or lying under the live oaks."

The country is very hilly and the railroad is at one moment along the shore of the bay the next in the darkness of the tunnel through the mountain. On the low lands are often hay fields covered with haycocks which indicate a fair yield. Conversation with a chance seat-mate developed the fact, though, that there is much disappointment at the lack of late spring rains. The drouth has shortened the grain yield materially, but the hay will be almost a full crop.

A few miles up from Tiburon, thirteen from San Francisco, an unlucky number, on a prominent point which juts out into the bay a large number of buildings attract attention by their size and appearance. They are some distance back from the railroad. The brakeman shouts "Green Brae, change for San Quentin." I didn't want a change of that kind and knew there were no agricultural notes there so did not stop. No, when it comes to San Quentin, farmers and fruit growers are not in it.

Two or three miles farther, we pass San Rafael—beautiful San Rafael. Its the site of a magnificent hotel and the home of many San Francisco business men.

At Petaluma, Sonoma county, thirty-seven miles north from San Francisco, we step off the train and shake hands with J. A. W. Gates who is representing the Cultivator in the north end of the state. Mr. Gates had come down from the north with good news as to the reception the Cultivator is receiving in the north. Hundreds of new subscribers and all pleased with the Cultivator. I sometimes wonder if the Southern California subscribers six or seven hundred miles from here know how the Cultivator is growing and entering new fields not only in these coast counties of Marin, Sonoma, Mendocino and Humboldt but over the great valley of Sacramento, in Placer, Sutter, Butte, Tehama and on up.

But again I am digressing. But instead of more car window views let us now take a buggy and get in closer touch with the farmer.

A drive of six or seven miles brings us to the live oak ranch of Frank Meacham. A stock ranch on which thorough bred stock is the pride of the owner. Five thousand acres of beautiful, rich land in the ranch. Some of it semi- moist valley land but the larger portion in the rolling hills. The hills are low with good feed to their summits. The feed is largely the na-

UPPER END OF SONOMA VALLEY.

BERRY GROWERS TO ORGANIZE.

The berry growers are the latest to see the necessity of combining to effect an organization which will aid in disposing of the large output of berries. There have been small associations, but now there is a movement to organize an exchange to include all berry growers of Southern California. Last year the lowest price to which Logan berries dropped was 5 cents. This year the price, which seems to be fixed by cannery and preserve factory, is 2½ cents. This about covers the cost of box and picking.

Besides the cost of boxes has been raised. Or rather, the $2.75 box which the grower preferred has been withdrawn from the market and a $5 one offered. So the life of the berry grower is a burden

The movement to secure relief started in Moneta about two weeks since. Committees were appointed to report to a later meeting. At this meeting, which was to be held last evening, the Gardena growers were invited to attend and the hope was to effect an organization which might be some little use this year and work out a plan which may lead to a permanent and successful organization.

Co-operation is more and more in the air, and we trust the berry growers may use it to advance their financial welfare.

A PICTURESQUE LINE.

The cuts on first page of this issue are from scenes along the California Northwestern line. It is a railway which may claim more picturesque views than one can often see over a similar stretch of road.

The road starts from Tiburon across the bay some six miles from San Francisco and runs north to Willits and passes through a rich and varied section. Along its line are some of the gardens which supply San Francisco, the largest poultry yards in the world, large stock ranches and the lumber camp.

It passes through a section great in possibilities of business or pleasure.

RAISIN GROWERS' CONTRACT.

It was the pleasure of the associate editor of the Cultivator to attend the called meeting of the California Raisin Growers' Association at Fresno last week. The meeting was made necessary by the failure of the directors to secure the signatures of the requisite number of growers to the five-year contract which a former meeting had given instructions to the directors to secure.

The existing contract which terminates this season was for three years and has been most satisfactory and so successful financially that it was supposed the five-year contract would be readily signed by seventy-five per cent. or more this year. But the natural suspicion of many of the growers coupled with some transactions of former officers made it impossible to secure more than fifty per cent. of the output.

The strongest one factor in preventing the success of the five-year contract was the Armenian growers. It seems these people have no separate organization at all, at the same time. are so closely bound together that they stand about as one man and they control twenty-five per cent. of the raisin output of the State..

After the failure of the five year contract the more loyal association people pulled for the signing of the three-year contract. The meeting, however, in order to secure as large a following as possible, decided to recommend the one-year contract. This was carried almost unanimously.

It was claimed on the floor that the five-year, or long period contracts would make possible more advantageous arrangements by the directors in that they could plan better, handle surplus fruit better and have better standing with the trade as a permanent organization than simply as one for only a year.

The yielding of the longer headed people seemed necessary to preserve the organization which has been the saving of the life of the raisin industry. This yielding is to the credit of these men and we trust will lead to a successful year and ultimately to a permanent organization.

There was an unpleasant feature at the close of the meeting. The new contract provides for a penalty of twenty per cent. from any grower who fails to live up to his agreement. This was violently opposed by one of the largest growers, but the mass of the members wished to know that all were either in or out of the association, so voted by a large majority for the twenty per cent. penalty and against an amendment reducing the penalty to five per cent.

The large grower in question then solemnly shook his finger at the audience and said "this action will cost you a cent a pound on your crop." This had the appearance of "knocking" and proves a statement recently made in these columns that "every co-operative movement has its kick-over-ative element."

It seems inborn in some men to ruin what they cannot rule. They are not big enough, broad enough nor brainy enough to force themselves to work for the good of all and in harmony with the majority.

However, we believe there are enough that are to make this a successful year for the California Raisin Growers' Association.

THE TILTON AGAIN.

The regularity with which the Tilton apricot bears its fruit has been claimed by those who have watched its past history. This year when most other varieties are shy in their bearing, proves no exception to the rule. Mr. Bairstow of Hanford writes: "I never saw the trees so heavily loaded before. Both old and young orchards are filled. The fruit is, I believe, a little smaller on account of this heavy crop."

A liberal sample of the fruit which Mr. Bairstow sends this office shows the fruit to be of fine color, the best of flavor and of fair size.

Mr. Bairstow writes that another season he will be prepared to furnish a large number of trees which are now growing thriftily.

W. H. Volck of the State University, has discovered that spray will rid almond trees of the red spider. The formula used will soon be made public.

THE PRUNE GROWERS AND CO-OPERATION.

At the regular meeting of the Farmers' Club held at San Jose last Saturday a good crowd was in attendance to hear A. R. Sprague of the California Fruit and Produce Exchange, and Geo. Andrews of the Rochdale Association discuss co-operative methods.

Mr. Sprague said he was there to consider with his hearers not the advantages of co-operation, for they were known, but what metnod is available by which they might at once proceed to gain the benefits of co-operation in the marketinag of their dried fruits.

The organization he represents, while at present interested in fresh fruit, can see economy and increased efficiency in the larger volume of business by the combination of their present line with that of dried fruits. There would be advantage for both, for the latter in the opportunity of getting in connection with an organization already doing a large and successful business.

The plan of organization is simple. It is thoroughly representative. Several local organizations for packing fruit form a central organization, to which they elect representatives from their various boards, and this allies itself with the California Fruit Exchange, to secure the outlet for its fruit to the Eastern markets, and to regulate to some extent those markets.

To be successful such an organization must be able to do business successfully from the start, to effect the sale of its products to as good advantage as any other way, and the experience of all such is that it is to better advantage. Provision must be made for growth and adjustment to conditions as they arise.

It is necessary, Mr. Sprague said, to know how much of the fruit can be controlled absolutely, but it is not necessary to have control of the whole product. It might be necessary to bargain at first for a portion of the crop only.

The commercial shippers would likely wish to join, and after a little it might be to the advantage of both parties to effect such a combination; but only when the organization of growers had shown sufficient strength to go alone, so they would be able to do their own marketing and have no discrimination against them.

In such a co-operative system the grower gets the profits in yearly dividends; and the system is more economical by far than the individual competitive one, so that the profits are much larger.

The Exchange furnishes all that the grower needs for curing and packing, such as boxes, labels, sulphur, etc., at current prices, and turns back the profits at the end of the year. The commission charges for sales, including all the work of agents and brokers, is the same as that of the commercial packers, 5 per cent, but the excess of this over actual cost is included in the yearly dividend.

Every co-operator helps every other co-operator. And we have to look to co-operation more than ever to solve the tremendous questions before us these days.

The handling of the fruit in the East is accomplished by a few tested, capable agents on salary, having a sufficient number of trustworthy brokers subordinate to them to solicit orders and place the fruit. Most of the fruit is sold by samples, before any of it leaves the growers' warehouses. The salesmen are under bonds and the Exchange has not had a single boss.

It is not thought best to pool all the fruit on grades. If one grower or one local exchange wants to get out a better grade, let this be done, and let the fruit sell on its merits. This tends to avoid the shipping of so much poor fruit, and to eliminate unjust discrimination.

The fundamental basis of all co-operation is fairness, justice, and in my experience of many years I have generally found the average man disposed to be fair. We need just to sacrifice non-essentials for the sake of harmony."

After general discussion by Messrs. Sanders, McGehee, Rucker, Childs, Pettit, Stevens, Babb and others, a motion was unanimously carried requesting the president of the club to see the presidents of the various co-operative fruit exchanges throughout the valley that all might join in one meeting to discuss the advisability of joining in a co-operative marketing movement.

LEFFINGWELL'S BRAND.

C. W. Leffingwell of Whittier is one of those thorough going men who believe in testing every new method which shows merit. The Teague tent system of lemon curing appealed to him, hence a thorough test of its merits.

Mr. Leffingwell has a large lemon ranch at Whittier, from which a magnificent stock of lemons may always be forwarded.

This week this office is in receipt of a sample of those lemons, apparently taken from the regular shipping stock. In flavor and texture they are excellent.

Regarding this stock Mr. Leffingwell writes:

Editor Cultivator, Los Angeles, Cal.,

Dear Sir: I am sending you today by express, a small box of lemons which I believe will prove of special interest to you, as showing how winter lemons can be kept by the new method of curing, called the Teague method. These lemons come from a carload lot which we put up in our house late last November. This fruit stood practically untouched from the time it was stored away until last week, when we graded and shipped the car. By actual count, this carload after standing about seven months, showed less than one-fifth of one per cent decay, and the fruit is of such quality today, that I would not hesitate to ship it to any market in the United States without ice. We kept this car, besides several picked in December which we are still storing, in order to make a thorough test of the merits of this new method. Knowing what I do of the uniformly good keeping qualities of the November, December and January clips of California lemons, I do not hesitate to say that every good lemon in the state picked during these months can be kept and sold in good condition during June and July.

We have furthermore been able, by the perfect control over ventilation made possible by this new system, to overcome to some extent the excessive moisture and sappiness which is characteristic of California lemons in the spring, so that we have been able this year to ship February and March lemons in May and June with practically no shrinkage. In fact, we had one car of such fruit held up by the recent floods and on the road thirty two days under ventilation, which showed only 10 per cent decay when sold.

C. W. Leffingwell, Jr.

COMPOST.

Regarding fertilizer, A. J. Drothzen in charge of the Valentine Peyton ranch at Highlands writes his preference for the economical plan of a compost heap in which weeds, leaves, cleanings from horse, cow and sheep barns are put in layers with peat and the whole rotted down. There can be no question, this would make an excellent dressing for any orchard. His suggestion is that it should be deeply plowed in. This is the plan usually followed.

His further suggestion that nitrate of soda or sulphate of amonia could be added to such compost heaps, we think not good. It would be needless and might prove great loss of expensive material. Besides rotted manure from well fed animals has a large content of the nitrogen in much cheaper form than that in the chemical mentioned.

In any case, the use of nitrate of soda should be direct on the ground at the time when tree is growing and ready to make immediate use of it. The application should not be followed at once by heavy irrigation or much of it may then be lost.

SEASIDE INSTITUTE.

A great program is promised for the Seaside Institute to be held at Long Beach July 27 to August 1. Every farmer or fruit grower who can plan his outing at that time will find a feast that will give inspiration for the coming year.

There are institutes and institutes, but this is to be the institute of institutes. A detailed program will be given in the Cultivator as soon as arranged.

Coast News and Notes

By R. A. Dague, 1045 Regent St., Alameda

The government reports show that our crop of cereals for a single year amounts to 90,000,000 tons.

S. W. Wadhans, of Monroe county, N. Y., says he has found that coal tar applied to peach trees is a sure cure for borers.

The recent floods in Ohio damaged property to the value of more than $50,000,000 and in Missouri to the amount of $100,000,000.

Uncle Sam is now engaged in distributing in California and elsewhere 1,750,000,000 baby fishes to be put in the lakes and streams.

Great consternation prevails among the farmers of Montana owing to the appearance of great clouds of grasshoppers. It is feared they may overrun the state.

The Hoytt Tree Prop factory at Watsonville was destroyed by fire last week. Loss about $2500. The coming big crop of oranges will doubtless compell an early rebuilding.

On account of the failure of the prune crop in France their commission men are sending letters to various firms of California with a view to buying largely here.

S. B. Wright of Santa Rosa, last week sold and shipped to E. D. King, of Burlington, Kansas, a valuable Berkshire boar. He weighed 462 pounds and is a fine animal.

Captain Lambsin of the U. S. Fish hatchery at Baird, on the McCloud river, has this season made a catch of more than fifty million salmon eggs. This largely exceeds the catch of last year.

The Oxnard sugar factory began operations the 25th of June. A good crop of beets from 1900 acres will be handled. This is a larger crop than was ever raised before in Ventura county.

Ireland was stocked by potato seed from California and no longer does Patrick order "Irish potatoes," but at the restaurant says: "Give me some mutton chops and mashed Californias, please."

Fresh fruit at this writing is coming on rapidly. About 40 car-loads per day now goes to the eastern market. Apricots, plums and peaches are now going forward. Cherries are about exhausted.

The weekly public sale of the Santa Rosa Poultry Association resulted at the last one in the disposal of fifty-one cases of eggs. The entire lot was sold to Geo. F. King, of San Francisco, at 20½ cents per dozen.

The announcement that Prof. E. J. Wickson will, during the summer school at Berkeley, give practical lessons on best methods of raising flowers, has attracted considerable attention and professional gardners and others will avail themselves of this opportunity.

On the 26th ult., twenty-seven yearling thoroughbred colts from the A. B. Spreckels' Napa stock farm were sent to the Dexter Park sales ring at Chicago. They are very fine colts and will bring fancy prices. Last year a like lot of yearlings from this stock farm sold for big figures.

The wool sale at Ukiah, last week, amounted to 900 bags and the prices ranged from 19½ to 20½ cents. Heretofore many sheep were raised in the vicinity of Ukiah. It was stated at this sale that many ranchers are giving up sheep raising and turning their attention to cattle.

Prof. W. A. Volck, of the State University, has for the past six months been in the hop fields of California, studying the little red spider so destructive to hop vines. He has found that the insect makes its winter quarters among the morning glory plants. He accordingly advises the destruction of this flowering vine.

The assessor's returns for the past year shows the total acreage of grape vines in the state to be 230,675 acres, of which 118,209 are in wine grapes and 89,792 in raisin grapes and the remainder in table fruit. The total increase of acreage over a year ago is 3,494 in Northern California and 6,807 acres in Southern California.

The newest device employed by the University scientists, C. W. Woodworth and Warren T. Clarke, in their campaign against the codling moth in the Pajaro valley, consists of a vat of water over which is suspended a lantern. A film of kerosene oil is put in the vats and the moths being blinded by the light fall into the vats and are killed.

A new government law went into effect July 1st which will operate to the benefit of our fruit growers and wine manufacturers. Under this law the Secretary of the Treasury is authorized to break open all original packages of wines or fruit packages from foreign countries and give samples to the Agricultural Department for analysis so they may be excluded if found adulterated or impure.

Were it not for the necessary thinning of sugar beets the raising of them would be more profitable. The best seed has as many eyes as a potato, hence the necessity of thinning. The Agricultural Department of the U. S. is trying to overcome this trouble. Scientists are endeavoring to produce a one-eyed beet seed so there will be but one plant grow from it, making thinning unnecessary.

Jas. P. Brown, secretary of the Arborculture of the U. S., says the storms of the Mississippi valley are due to the scarcity of timber. Still he says the people of the United States ar deforesting 25,000 acres a day, or 9,000,000 per year. Mr. Brown asserts that the people of the United States have destroyed more timber in sixty years than have the Chinamen in the last three thousand years.

An observing Californian says there are fortunes awaiting the men who manufacture cement in this state. Here we have enormous quantities of the necessary ingredients. Heretofore the lack of fuel prevented its manufacture. The discovery of oil has supplied this deficiency. Last year 26,000,000 barrels of cement were marketed in the United States and Canada and very little of it was made in California, although we are better equipped for the business than any other state.

The co-operative cannery at Healdsburg has begun operations. The plan on which it was organized is as follows: Fruit growers bring in their fruit and deliver it to the directors who are chosen from among the growers. The grower so delivering fruit gives his note to the directors for the amount of expense of canning. When the canned fruit is sold the proceeds will be divided and expense deducted and notes returned to growers. The notes are used for security, for money borrowed at the bank to pay current expenses.

Prof. C. W. Woodworth, professor of entomology at the State University, is now trying an experiment that cannot fail to interest all. Last year he received a large number of eggs of silkworms from China. They are now hatching out. He is feeding them on lettuce instead of mulberry leaves. The professor says he has ascertained that lettuce contains all the properties of the mulberry leaf and he is convinced the insect will thrive on the plant. There would be also the advantage that the worms could feed themselves on lettuce, while mulberry leaves have to be gathered and fed to them.

From reliable sources the Cultivator representative here is informed that at this writing there is a big stock of hold-over peaches in California warehouses, worth from four to six cents. There is also a pretty large stock of hold-over apples. Walnuts and almonds are well cleaned up. Seven to eight cents are now demanded for future apricots. Future peaches, it is thought, will range from four to five cents and prunes from two and one-half to three cents. Walnuts from eleven to thirteen cents; apples will be about five cents and pears from five to six cents. Pitted plums, four to five cent, unpitted, one cent.

From A Business Standpoint

By J. W. Jeffrey, Los Angeles

BUSINESS FROM THREE STANDPOINTS.

The citrus fruit growing industry of California presents the three phases of the fruit business more distinctly than any other line of the general industry—i. e., growing, preparing and selling the products of the orchard. In orange and lemon growing these three departments are almost entirely separated, each now representing a distinct field of operation and governed by different conditions throughout.

It may be profitable to discuss these features and see how the economics affect each, from which we may draw some valuable conclusions. The marketing of the fruit is admitedly the most complex of the three, for it not only involves the vicissitudes of transportation, which are imemnse in handling perishable products in large quantities, but it involves the distribution of the fruit and the sale of it—two propositions that may well draw upon the genius of the sellers for correct solution. In the successful prosecution of all these departments the same economic principles prevail. But these principles are controlled by circumstances widely different in character. The grower has control of the influences that tend to the best production of crops, and through co-operative representation he can control the preparation of the crops in his local packing house. It is the second and third propositions that defy individual effort, and it is to these we wish to address a few words for consideration.

It is reported that a considerable acreage at Highlands is organizing to adopt means of marketing independent of the California Fruit Agency. These independent growers propose to build a new packing house and blow in a lot of money in what is likely to prove a disastrous experiment. In the first place experience has proven that no one is independent of his fellow fruit growers, the very complexity of the marketing problem as a whole making individual action disastrous. In the preparation of citrus fruit for the market, the business has reached the point where absolute economy must be observed. Too many packing houses have already been built in the failure to recognize that in this age the laws of competition are more necessary of observance than ever, and that every item of expense must be reduced to the lowest point in order to succeed. In so far as the independent institutions with limited acreage fail to pack their fruit at a cost at or below the average houses, they are handicapped before their fruit is started on its way to market.

The shippers who were outside the Exchange through the requirements of competition for patronage of the growers, were compelled to build and equip packing houses far beyond the commercial requirements of each district. Riverside, Redlands and Covina are examples of this wonderful waste of capital in the construction of unnecessary packing houses, and the result was the inevitable closing of those which were not required in the economic work of preparing the fruit for market. This over-capitalization of the preparatory facilities was one great element that led to the consolidation of the outside shippers into an organization known as the California Citrus Union, in order that fruit could be packed at the lowest possible cost. Do the independent shippers think they can succeed upon lines that have been vainly tried by men equipped with experience and capital in unlimited quantities? Ultimately purely economic influences must prevail, and the grower has already gained largely by the elimination of a large number of packing houses, for it was he who paid the expenses of maintaining every house not necessary to the business. The Highlands independents claim they can pack their fruit and sell it cheaper than the 39 cents charged by the Citrus Union.

As to the selling, that will be considered in the next paragraph. But it may be remarked in regard to packing expenses that some of the most successful associations in the Exchange do their packing by contract. This would indicate that the margin is very small between contract packing and doing it by the association themselves. However, experience will show that roseate calculations often fail to materialize, and that the small, independent association will find many lions in its way toward realization.

But it is to the third phase of the business—the marketing problem—that the growers should direct their special investigation before launching into the troubled waters of fruit selling upon an independent basis. Here co-operative effort is supreme. The orchardist may hire his packing done, for it is a simple problem and under his own eye and control. He can also hire a commission man to sell his fruit, as he will have to do, no doubt, acting in an independent organization. Did he ever see a commission man in action or attempt to control the fruit after the commission man had secured control of it? Orcharding is crowded with the graves of defunct enterprises, put to their last quietus by the commission system. Fruit may be grown and packed under the control of the owner, but sold, never unless the grower organizes and sustains his own agency. In this latter achievement the same economic principles prevail that are found in producing and preparing the fruit, with the difference only in the fact that the complications that beset the markets are largely beyond the influence of the individual grower or association. An agency capable of holding its own in the markets must be strong enough to cope with the fruit trade combinations and chicanes of the business; it must have the amount of business to justify the maintenance of a selling agency covering the entire field and directed by men capable of grasping the situation in whatever phase it may be presented; it must direct the enormous capital invested in the citrus fruit business through accredited representatives and have the power only attainable through co-operation in order to meet the exigencies of this commercial problem involving refrigeration, transportation, distribution, competition with other fruits and the opposition of the commission merchants who are organized as one man. A few growers expecting to do an independent business should stand appalled before these conditions, for they are not able to organize an agency of respectable proportions, and consequently must depend upon the commission merchants to do the business for them. The California Fruit Agency has already put out of the business about 700 intermediaries, who were found necessary under the plan of selling one year ago. Now the independents propose to re-employ some of these unnecessary factors, either as direct agents or as commission merchants. There is no business sense in this and the experimentors will rue the day they try to restore a system of selling competition with other growers' organizations—a system altogether bad, as the growth of the Agency will declare.

Dr. Shaw, of the University, after careful study of the subject says the sugar beet industry should be a leading one in California. In a region from San Francisco to San Bernardino 60,000 acres are devoted to beets which produce annually a value of $10,000,000. These figures show that the value from the product equals that derived from the prune crop or from the sale of butter. It more than doubles the value of the potato crop and surpasses the raisin crop by $1,000,000, and the bean crop by $2,000,000. Exclusive of the land owned by the various companies the capital invested in the factories will aggregate approximately $12,000,000.

A new industry is growing at San Jose in the use of the kernels of apricot pits. Last year 1500 tons of kernels were extracted from the pits and shipped to Europe and made into oil which is used in the manufacture of fine soaps and confectionery. Seven dollars per ton was paid to growers last year and that price will be exceeded this. A pit cracker has been patented by the use of which the work will be done cheaper and quicker.

82669

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so faras possible, advise treatment in casethe species are harmful. Insects should be put in close, strong boxes. They need no airother than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

ANTS AND CUT WORM MOTH.

Reader, Arroyo Grande, sends some insects and wishes to know their names and habits. There are two specimens in the box, one of the common cut worm moth, parent of the caterpillars which have been so destructive the past season. These moths lay eggs, as I have previously stated, and from these come forth, as they hatch tiny caterpillars with sixteen legs. These grow rapidly, eat ravenously, and change to moths again early next summer. These have done exceeding damage this summer. Thousands of dollars would not make up for the loss caused by them in the alfalfa fields about Pomona. The strong probability is that it will be several years before we shall have them in destructive numbers again.

The other insects are queens and males of one of our common ants. As all know, ants burrow in the ground and in these tunnels they make their home. They carry in seed, etc., for food, and often are found in great numbers in a single colony. At this season of the year there will be found the old queen with no wings, as her wings have been bitten off, a great many wingless workers of small size and a large number of males. About this time these young males and the queens, the only ones that have wings, come forth from their underground home and fly forth in great numbers for the purpose of mating. It is probable that "Reader" saw one of these nuptial flights and thus secured the ants which he sent. All ants have a peculiar hump on the peduncle of their abdomen. This will tell the ant group from all other insects. After mating the males die. The queen is taken by some workers, conducted to some underground home, her wings bitten off so that she cannot go forth into the world again, when she becomes the mother of another growing colony. For the most part, ants do very little damage. Except for annoyance in the house or on lawns I have never known them to do any damage. Some of my good friends, however, think that where their tunnels are near trees, they do considerable damage in the orchards.

* * *

RASPBERRY BLIGHT.

Mr. True, Lordsburg, brings me raspberry twigs that are dying for some reason. He says it is quite serious about their place. I have received many such samples this summer. It seems to me there must be something that troubles their roots. I have made suggestions several times that people examine closely the roots of their plants in all such cases of blight. Fuller's rose beetle in the grub state might possibly be the cause of the mischief. Again, plant lice are often the cause of such decline in vegetation. It has recently been shown by the valuable researches of the entomologists of our state university that the peach aphis, early in the season, goes to the roots, where it is likely to do much more damage than it does to the foliage. I remarked in an article a short time since that enemies of the plant lice were often the cause, I think I may say generally the cause of their disappearance in early summer. In some cases it may be that they simply go underground and have not ceased to exist but have simply passed out of sight. It only remains to be said that it is very difficult to destroy plant lice, or indeed any insect that works underground, destroying the roots of plants. The bisulphide of carbon and strong tobacco decoction have been a decided success in combatting some forms of these underground pests.

* * *

DESTROYING SQUIRRELS.

S. F. Pencier, Sierra Madre, asks about the method of destroying squirrels by the use of bisulphide of carbon. The principle of this lies in the fact that this liquid is very volatile and the vapors are very destructive to life. Therefore, when insects, or even higher animals are confined in an atmosphere loaded with the vapor of this poison the animals are quickly killed. To kill squirrels we pour an ounce or more in the hole, depending on the size of the latter, stop up all openings with clay and then hope that we will succeed. This does not work well except in a wet time as unless the ground is water soaked it permits the vapor fumes to pass off so quickly that the animals are not destroyed. Of course if we are not successful in finding all the holes and stopping them up we cannot hope to succeed. I believe destroying squirrels by means of poisoned grain is usually more satisfactory than by bisulphide of carbon.

* * *

DISEASED LEMON FOLIAGE.

F. Coulter, Fullerton, sends me lemon leaves which are seriously blighted. He asks for cause and remedy. The blight was defined in sharp limits to certain parts of the leaves. I had seen nothing like it before, and so sent it to Prof. N. B. Pierce. He pronounces it a local form of gumosis, from which the epidermal cells are destroyed. He thinks the cause is local. It sometimes comes from soil, water and especially from heat. It is probable that no serious consequences need be expected. Prof. Pierce also sends me for identification some pupae and imagos of moths received from Orange. These are the common Peridroma saucia which have been so destructive the past year.

* * *

DISEASED APRICOTS.

It will be remembered that I referred in a recent Cultivator to diseased apricots received from a canyon orchard near Santa Paula. I sent a few to Prof. Pierce. He tells me that the disease is not uncommon in California. It has been in the state for many years. It is caused by one of the "shot-hole" fungi, a species of Phylesticta, probably P. circumscissa. Prof. Pierce further states that injury may be prevented to a large extent by the winter use of Bordeaux mixture, though in severe cases summer treatment may also be needed.

* * *

GYPSUM FOR ALKALI.

C. F. B., Thermal, Calif., is anxious about alkali. He says that it comes to the top on his place and destroys the young plants just at the time of germination. He wishes to know if gypsum would be a remedy, and asks where the material could be secured, of good strength and at reasonable cost.

As I have frequently stated, alkali as we usualy consider it consists of three salts, carbonate of soda, or black alkali, which is the worst, sulphate of soda, or white alkali, which is the least injurious, and common salt or chloride of sodium. This latter is not so bad as black alkali but when in too great abundance is bad enough. As is well known, gypsum does help black alkali soil. It changes the black alkali into the less destructive white alkali. As I understand, the soils about Thermal are poisoned, not by black alkali, but by common salt. Therefore I believe that the use of gypsum would be entirely powerless to do good. I believe it would be money thrown away. The best way is to purchase land in which the salt has been washed out. In case a part of the farm has a superabundance of this common salt the best remedy will be to wash it out by ample irrigation with good under drainage. We must not forget that this under drainage must be perfect or else we make a bad matter worse with too liberal use of water.

* * *

A B C OF INSECTS CONTINUED.

In last week's Cultivator I commenced a series of articles on practical entomology. I closed with a short reference to mites and the collossal forms of ticks. In this article I wish to continue the discussion of these very interesting animals. It will not do to call them insects because they belong to the great spider and not to the insect class. When mature they always have eight legs, while all true insects have but six. These mites and ticks are very varied in their habits. We know that the red mite, the clovee mite and the silver mite are very destructive to our fruits and vegetables. Many mites work on household products. Many a lady has sent me flour with the question, "What is the matter with my flour? It is altogether too lively to suit me. I am quite content when it is in the bread pan to see it rise but I strongly object to seeing it walk off." The cause of this perturbation is the multitude of these mites, known as flour mites. The itch mite of the olden time worked in the angle between the fingers, and often persisted so long that it was called the seven-year itch. A long slim mite worked in the forehead and other parts of the face, mostly of girls, causing pimples and thus often marring the fair face of beauty. While the itch mite has largely disappeared, the pimple or face mite is still quite common even in civilized countries. A gall mite, known as Phytotus, works even in California on walnut leaves and on the pear. This is also a long slim mite like the face pimple mite, but instead of the eight legs, it has only four, and so is an exception to all other mites. It is exceedingly minute, and so the microscopist does not easily find it. The whitish blotches on the under side of walnut leaves and the corresponding raised surface on the upper side is caused by these Phytotus mites. I do not think that these mites do very great damage as I have seen them very abundant on the leaves and yet the trees seem in good vigor and the production of fruit did not seem to diminish.

The silver mite which attacks citrus fruit, and the lemon more largely than the orange, is quite serious in some sections, especially about San Diego. It discolors the fruit and so does a good deal of damage. I do not know positively of any good remedy, but as we know that the distillate spray is quite effective against the red mite (red spider) I should certainly hope that it would help us to fight successfully the silver mites. I would be glad to hear from any who have been successful in meeting this foe of the citrus fruits.

The most common and most justly dreaded of any of these mties is the red mite, which has become so grievous a pest in our orchards. These suck the juice from foliage and fruit and thus weaken the trees often to such an extent that the fruit is likely to drop in such large proportions as to produce serious loss. The vigor of the tree is also seriously impaired. These mites reproduce so rapidly that they justly cause no little alarm. Fortunately the distillate spray has been found a quite efficient remedy. It is probable that these mites find our dry seasons and dry weather very favorable to their work.

Another little mite, Bryobia pratensis, works on nearly all our plants and often multiplies in such numbers that they often swarm forth and enter our houses. It is known as the clover mite. They often come in upon us in such overwhelming numbers that the little specks are seen crawling over everything. I have heard of these raids in several places. Small as the mites are, people whose houses are invaded are greatly disturbed when the mites come in such numbers as to take the whole premises by force. One of our Claremont neighbors had such an invasion two or three years since. I have always advised the keeping off of the invasion by the use of kerosene oil. Cloths wet in this are so placed as to prevent ingress.

As before stated, the Texas tick is a collossal mite. It is quite a serious pest in itself, disturbing the horses and cattle on which it feeds not a little. The animals of Texas and contiguous states are used to it and so are not overcome or very greatly injured. Introduced onto other horses and cattle it often becomes an alarming pest. I actually knew of fine horses killed in Michigan by these ticks. But the great damage from these ticks comes in their great spread of the germs of Texas fever. A minute animal, a little Sporozoon, is the case of this fatal disease. It increases with astounding rapidity and lives upon the red blood corpuscles which it destroys. Young calves can have the trobule with no serious results, while older cattle once infected with these animal germs are almost sure to die. The cattle of Texas and other infected regions have the disease while young, recover from it and are ever after immune. If such cattle are taken to other regions they carry the tick. This tick carries the animal germs from the immune cattle to other cattle. These latter thus contract the disease and are almost sure to die. Thus the Texas tick is economically far more important than even the red mite.

(To be continued.)

IN DAIRY AND ORCHARD.

Continued from first page)

tive wild oats, burr clover, etc., on the hills, but in the valleys with the native grasses is the meadow soft grass introduced in this country from Europe. The local name applied is "Mesquite" some calling it "Texas Mesquite." It is not of course Mesquite at all, the botanical name is Halcus Lanatus. Prof. E. J. Wickson told me that it does not show by its analysis, great value as a feed. Mr. Meacham said that he thought a great deal of it and if fed at the right time, before it is too dry and ripe, that the stock liked it and seemed to do well on it.

In any case it adds wonderful beauty to the landscape. It grows, according ot soil and moisture, from one to four feet high. It is now in full bloom, or forming its seeds on the head, these are four inches long at the end of the long slender stems. It is not exactly a lilac shade, yet it gives the field a beautiful coloring as it waves in the wind.

Mr. Meacham took pride in showing his fine stock. He has 5000 sheep of three breeds and 150 cattle. His cattle are all of the Red Polled. Regarding the breed Mr. Meacham says: "As their name signifies, they are red in color, and abbsolutely without horns.

So strongly are they bred in these characteristics, that when crossed with other breeds and of a different color, the progeny, with rare exceptions, will be without horns and red in color. They are frequently confounded with other polled breeds, but are as distinct from them as they are from the Short Horns or Holsteins. Their dairy qualities are unexcelled; they give a heavy yield of rich milk."

At the head of his herd is Eyke Dandy purchased of V. T. Hill of Delaware, Ohio, who imported him. He is a beautiful animal as are all the cows.

One of the features of this ranch is the American Merino. The Merino is common. The American Merino is Mr. Meacham's own. The breed was started by his father, Harrison Meacham, some 30 years ago when he started to breed the horns and wrinkles from the Merino. He has succeeded completely, at least he now says "I don't have a lamb in fifty that has horns. They are better about shearing and they don't fight."

The Shropshire, the great mutton sheep is also a breed whic.. Mr. Meacham keeps. Another and later favorite is a recent importation of Rambouilett rams. The Rambouilett is a French breed, though the crack one of the flock is imported from Germany. This is "Winckelmann 159 a mammoth fellow who sheared, with ten months wool growth, thirty pounds. To appreciate that weight of wool it should be compared to the ordinary clip of about eight pounds. These sheep sometimes reach the weight of 250 to 300 pounds, have strong constitutions and are good foragers. Mr. Meacham says they will make a magnificent cross with the American Merino.

But we must not linger too long in this place though the hospitality of Mr. and Mrs. Meacham constrains us to stay.

California Horticulturally...

John Isaac, Sacramento

CHERRIES FOR PROFIT.

The cherry crop of the Sacramento valley is nearly over, and it has been a very fair one, not so large as it was hoped for earlier in the season, but still a good average crop, while it has netted the grower good prices. If we may believe the statements in relation to the profit in cherry growing, made by some of the growers themselves, the deciduous fruit, or at least this branch of it, is not in such a bad way after all. The Giblin Bros., of Yuba City, have an orchard of 302 trees from which they delivered to the cannery 30 tons of fruit, for which they received 5 cents per pound. For this they received $3,000, and besides sold some at retail at 6 cents. The total expense of cultivating, picking, delivery, etc., was under $550, which left over $2,450 net from a little over three acres of land. This almost equals orange growing under the most favorable circumstances.

* * *

THE COMING PRUNE CROP.

Reports from Santa Clara valley, which section produces the largest part of the prunes shipped out of the state, are to the effect that the present season's crop will be a very poor one in regard to quantity, but of very superior quality, running to large sizes. There is always a tendency on the part of the grower to bear the market in his own interest, and predictions of short crops of fruit can generally be taken with a grain of allowance, but there is still little question but that the prune crop of Santa Clara will fall far below the normal. To compensate for this, however, the crop in most other sections will reach very nearly or quite the normal yield and the total output of the state will be fully up to the average. How we shall dispose of them is still an open question. Owing to a failure of the prune crop in France for two years, we have found there a market for a large portion of our surplus, but this is a condition which is not likely to occur again for some time, and we shall be confined to our home market for the larger part of our crop. The American people have not yet become educated to eating prunes; they are, to most of them, a sort of luxury, which they regarded as a treat when they were children, and have never yet learned to look upon them as an article of diet. With a normal crop, this state would produce 150,000,000 pounds of prunes, to which is to be added the output of Oregon and Washington. It is a strange state of affairs when producers are thankful for short crops, but, in the case of prune growers they certainly are. In the meantime there is a chance for a campaign of education, in which the American people should be taught to eat less meat, which is dear, and more prunes, which are cheap and wholesome. This means lots of judicious advertising, which the prune men can better afford than to lose a large part of their crop and sell the balance below the cost of production.

* * *

FRUIT GROWERS AND STRIKES.

A few years ago the employees of the Pullman car works had some trouble with the company, and the fruit growers of California, who had no interest in the matter whatever, and did not know what it was about, and did not care, were losers to the extent of a million dollars. Some two years ago the teamsters of San Francisco and the men who employed them had some sort of trouble, and again the fruit grower was made to suffer. In these cases the unfortunate fruit grower was innocent of offense but was punished for his innocence, and his fruit at the most critical time was left to rot on his hands because no one was allowed to handle it. It looked for a time as though this thing was to be repeated this season at the expense of the fruit growers on the Sacramento River, for just as their fruit was coming in, and the reward for their labor and outlay was at hand, the deck hands on the river boats, which handle the greater part of the fruit from this section, went on a strike. Fortunately the matter has been adjusted for the present, but there is no telling where it will break out next, but one thing is certain, the fruit grower will get the worst of it.

* * *

DECIDUOUS FRUIT SHIPMENTS.

Sacramento is now in the midst of the fruit shipping season and fresh fruit is going forward at the rate of 25 carloads daily. The recent warm weather has ripened all fruits with a rush. Apricots are coming in in great quantities, and while the crop is lighter than last year, it is remarkable in consideration that this is an off year. Last year was an apricot year and the crop was a very heavy one. According to precedent, this season should have given a very small crop, but as it is we have a very fair one. Placer is our early peach district and heavy shipments of this fruit are now being made from Auburn, Newcastle and other points in that county. Over most parts of the fruit section of northern California peaches have turned out very well and in many parts vigorous thinning has been necessary to produce marketable fruit. Shippers of deciduous fruits last season complained bitterly of losses, due largely to their fruit being so long on the road that it arrived in market in unsalcable condition. The railroads have promised to give better service this season, and the growers evidently have faith in them, as the movement of fruit so far gives promise of as heavy shipments this season as ever.

* * *

MORE FARM HELP WANTED.

The cry for more labor still goes forth from all parts of northern California. Canneries, driers, orchards, packing houses, all demand more help. The California Promotion Committee has done excellent work in their endeavor to induce desirable white labor to come to California, but the people whom they have influenced to come is as a drop in the bucket to those required. The hop yards will soon be demanding help, the fullness of the fruit harvest will soon be upon us and, with a scarcity already in the season, what will we do later on? In the hay fields, $2 and $2.50 per day and found has been paid, and it has not always been possible to get enough help at that. There is a limit to the amount the farmer can pay, and that limit is reached when it costs more to harvest a crop than it will bring, and this limit is nearly reached now in some cases. There is no question but a large per centage of the produce of our state this season, both of the farm and orchard, will be lost for lack of sufficient help to take care of it.

* * *

FRUIT GROWERS AND THE PARCELS POST.

The late Fruit Growers' Convention strongly indorsed a domestic parcels post system, and through a committee laid the same before President Roosevelt. That he considered the matter favorably is evidenced from the fact that word has since been received from his private secretary, Mr. Loeb, that the matter has been referred to the Postmaster-General. This is the next step in advance that our postal service must make, and it will be forced upon us in spite of the opposition of express companies and other interested parties. In this the United States is now far behind many other powers, and some very much inferior to us in other respects, are ahead of us in this regard. It is an absurdity that, to any part of our own country we can only send a package weighing not more than four pounds and for that have to pay at the rate of sixteen cents a pound, while we can mail a twelve-pound package all the way to New Zealand at twelve cents a pound. When we become fully aware that we are discriminating against ourselves and in favor of foreign countries in our postal system, and this for the benefit of express companies, there will be a change. This is a matter in which the fruit grower of all others is directly interested, as under a parcel post system he would be enabled to send small packages of fruit through the mails at reasonable rates and be assured that they would reach their destination in good season and in good condition. Such a system would greatly enlarge his market, and it was this view which led them at their last convention to take active steps in its favor.

* * *

LOSSES FROM DESTRUCTIVE INSECTS.

Insects are such insignificant things that, even when we know them to be injurious, we rarely comprehend the extent of damage they do and the amount of loss they cause us. Dr. H. C. McCook in an article in Harper's Weekly gives some figures in this matter that are startling to one who has never studied it. The chinch bug, he says, caused a loss of $30,000,000 in 1871, upwards of $100,000,000 in 1874 and $80,000,000 in 1877. The Rocky Mountain locust in 1874 destroyed $100,000,000 of the crops in Kansas, Missouri, Nebraska and Iowa. The cotton caterpillar causes an average loss of $15,000,000 in the southern states, while in 1868 and 1873 this loss was doubled. The grain weevil inflicts an annual loss on us of $40,000,000 and the codling moth destroys from $30,000,000 to $40,000,000 of our fruit annually. These are but a few of the destructive insects which are working in our crops, and, if it were possible to compute the damage done by all, the figures given above would appear insignificant. It is a fortunate thing that for most of our destructive insects nature has provided enemies that keep them in check, or it is doubtful whether these insignificant specks in the animal world would not drive the lord of creation himself off the earth.

Woggsy—"How do you buy your music?" Boggsy: "Like my wood, by the chord." Woggsy: "I prefer to get mine like my note paper, by the choir."

THINNING BRANCHES ON YOUNG APPLE TREES.

Editor Cultivator: I would like to know if thinning out this year's growth of wood in my one and two year old apple trees will injure them if done at this time of year? Also, is it too late to whitewash the trunks of trees? J. K. Mortimer, Santa Rosa.

It will not injure your trees to thin out the surplus branches on your young apple trees at this time of year. In fact we think it is the best time of year to do it. If removed now the scars will not be so great as if removed later and besides they will nearly heal over between now and the time that the trees will stop growing. If the tops are much thinned out it will be well to whitewash the branches that are left exposed. It is not too late to whitewash the trunks though it would have been better to have done it a month or more ago. Paint the scars that are over half an inch across, with hot wax or paint.

* * *

GUMMING OF CITRUS NURSERY STOCK.

We have recently had several inquiries for a remedy for gumming of small citrus trees that are in the nursery or have been recently planted. We are sorry that we cannot do more than suggest. It is presumably the same disease that causes the gum to exude from old trees. Disinfectants have proved beneficial with them and no doubt will with nursery stock. The chief difficulty here lies in the fact that nobody wants trees which have been affected with gum in the nursery. We do not know that we have a right to give a remedy unless we know that it will cure the trees permanently. Anything that will stop it and cover it up for a while only passes it on to the next man. A spot the size of a twenty-five cent piece will render a nursery tree worthless and a much smaller spot will make it a weak tree that is liable to be troubled with the disease later on in life.

For those who have young orchard trees which show gum spots, we would suggest the following treatment. Cut out the bark and wood where the gum shows and wash the place with a formaldehyde solution, using about one ounce of the article as sold in the trade, to two gallons of water. It is a powerful disinfectant, clean and agreeable to handle. Used as a spray in a room, one part to 600 of water, it will cause a stinging sensation to the eyes and nostrils, but leaves no bad effects. If the gum disease is caused by a germ, the formula above will have a tendency to stop it. It will be sure to kill all germs that come in contact with it and if it is not a germ disease the treatment will do no harm.

We have been asked what formaldehyde is made from. We have been told by chemists that it is a form of dehydrogenized alcohol, that is an alcohol with some of the hydrogen taken from it.

* * *

THE SUGAR PRUNE.

Mr. C. W. Reed of Northern California, says that the sugar prune is a great improvement over the ordinary French prune with him. That it weighs from six to ten prunes to the pound green and from 15 to 26 to the pound when dry. The fresh fruit analyzed nearly 24 per cent sugar. The trees seem to bear heavier crops as they grow older and have proved to be vigorous growers on both peach and almond roots. Mr. Reed thinks that this prune will supply the fancy and middle grade of prunes.

We wish that we could recommend it for Southern California. It has been our experience at the Pomona station that the sugar prune is absolutely worthless when grown on plum stock. It does not grow as large as the ordinary French prune, cracks open and gums. It took the grafts three years to grow four feet long. We do not know what it will do on peach and almond in Southern California, but we would discourage the idea of grafting or budding over old prune orchards to it. We are confident that it would end in failure.

* * *

BUDDING PECANS.

The United States Department of Agriculture has recently issued a bulletin describing the successful budding and transplanting of pecans. It says that the principal trouble seems to come from selecting immature buds. It is believed that the best stock comes from nuts gathered from the northern borders of the pecan belt, as they are more liable to be hardier than those grown farther south. The nuts should be kept over winter in boxes, layered in a mixture of sand and ashes. They are planted in the spring in rows running east and west so that they can be budded on the north side. The trenches for the nuts should be three feet apart and five inches deep. The bottoms of the trenches are filled about two inches deep with leaf mold and sand mixed in equal parts. The nuts are placed in them five inches apart and some dirt raked over them and on top of that is placed a mulch about one inch deep to prevent the surface from crusting.

The buds used for propagation should be selected from those grown the previous year. The best buds grow from the base of the shoots that come from axillary buds the preceding season. These dormant buds can be easily removed from the bud stick and can be handled without injury. After the union is made and the stock is cut back, these buds make a much stronger growth than buds of the current year's growth. The bud sticks are cut as needed, the current season's growth being cut off when the sticks are taken from the tree. These buds can be kept fresh several days by wrapping in a damp cloth or sack.

Budding is done by making two transverse cuts about two or three inches above the ground line and one inch apart. These are connected by a perpendicular cut through the center. The bark on each side of this cut is raised to admit the bud which is cut exactly the same length and a little over half an inch in breadth. Much care is necessary in removing the patch of bark with the bud from the scion so as not to injure it. The outer bark of the patch is shaved off so as to make a perfect fit under the two flaps. The bud is held in place with a piece of raffia and a little wax smeared over the top cut to keep the water out. The whole patch except the bud is wrapped with strips of waxed cloth so that it laps half way with each wrap. The wrapping must be started at the bottom so as to shed the rain and dew. As a precaution against the sun, a piece of paper is wrapped around the stock and tied about an inch above the bud and left open at the bottom. After the first week the paper can be removed and after fifteen days the raffia can be cut.

It is said that this method of budding the pecan gives a satisfactory union. With carefully selected buds from one year old wood and vigorous seedling stock, every section of the bark will unite. Triangular pieces of bark with the bud in the middle can be used when the stock is small but the edges of the patch must fit the incision in the stock perfectly. The apex of the triangle should point upward. A small quantity of soft wax is smeared over the lines of incision before the raffia is tied on. This method of budding is especially useful with small stock.

The buds should be started into growth as soon as possible. This is facilitated by removing the top of the seedling so that but two healthy leaves are left on the seedling stock at the base of the present season's growth. The buds that start out at the axils of the leaves should be removed at once. Within a month the scion bud will have developed several good sized leaves. If the buds are inserted before the end of June there will be time enough for the development of a good sized shoot. The scion should be tied to the stock after it has grown a few inches. The old stock should not be cut off until the beginning of the second season, when it should be smoothly cut and the stump covered with warm grafting wax.

It is not safe to transplant pecan trees that have been budded until they are three years old. It is essential that some of the roots be left entire and it is best to remove as little as possible of the roots and tops. The roots should be left uninjured at least two

The DUPLEX STEP LADDER
The Step Ladder That Is An Extension Ladder
To the Orchardists of Southern California: An all purpose ladder, the article so long desired, is offered to you in the "Duplex Step Ladder." It is a ladder that combines all the advantages of a step ladder, and at the same time a full length ladder. It is a step ladder that can be locked in the hinges at any angle. It is a straight ladder double the length of the step ladder. The Patent Step Fastener used on the Duplex Ladder is perfect, and completely overcomes the tendency of the step to break loose from the sides. The Duplex is made from selected spruce, a wood that gives the greatest strength with the least weight. To see it is to admire it. A hardware dealer in every town sells it.

and a half feet long. The roots should be dipped in liquid mud as soon as taken from the ground, wrapped in wet sacks and again dipped in the mud before planting. It is essential that at least one top branch be left without removing the terminal bud, as such buds start more readily than older buds lower down on the stalk.

* * *

SUMMER PRUNING RASPBERRY BUSHES.

The Wisconsin experiment station has been making a series of experiments in pinching back the shoots as they reach different heights. The experiments covered four years and Gregg and Cuthbert were used in the trial, 36 plants of each. It was found that pinching the Gregg when 24 inches high increased the yield, but decreased the yield of the Cuthberts. Pinching back when two feet high gave better results than when cut back when one foot high. A record of the number of shoots was kept and showed that pinching back increased the number on Gregg and decreased the number on Cuthbert. Pinching back increased the size of the berries on Gregg and decreased the size of Cuthbert. When the bushes were pinched once they filled up the space between the rows as close as those which were not pinched. When pinched twice the bushes were more dense than those which were not.

The following table shows the interesting average result of the four seasons' experiments:

* * *

POTATOES AND PEANUTS.

Editor Cultivator: Will you please tell me what quantity of seed is required to plant an acre of potatoes; also an acre of peanuts?

What is the average yield per acre on light, sandy loam about 200 yards from a stream?—A. S., Pala, Cal.

When the tubers are planted one foot apart in the rows and the rows three feet apart, and whole tubers that weigh four to the pound are used, it requires 3600 pounds of seed; half tubers, half that amount and quarter tubers one-fourth that weight. The usual weight of seed pieces is about one and a half ounce. When potatoes are quartered lengthwise they give the best results. Large potatoes have fewer eyes than small ones in proportion to their weight, and this makes a difference in the amount of seed required per acre. It will vary from 300 to 1800 pounds per acre.

It takes from fifteen to thirty pounds of peanuts to plant an acre, but we cannot tell you what the yield will be on light sandy soil 200 yards from a stream. We cannot see what influence the stream would have on the crop from such a distance unless the water table is within four or five feet from the surface.

If there is a clay stratum within four or five feet from the surface and the water enters above it from the stream, your peanut crop will derive some benefit from the seepage of water. The yield of peanuts from soil adapted to their culture varies from about 500 pounds to one ton. The yield depends on the previous use of the soil. If continually cropped with peanuts, it may start at 1500 pounds and run down to 500 pounds in a few years. Peanuts are an exhaustive crop because the entire plant except a small part of the root is hauled off of the ground at harvest time and any of it is seldom returned.

The Missouri Agricultural Experiment station has isued a bulletin to counteract the reports which have been circulated that the Middle West will have no corn crop. In this bulletin it is stated that the unprecedented rains have destroyed wheat, rye, oats, and corn in many localities of the State. It is not yet too late to secure good yields of several valuable forage and grain crops. Only seventy-five per cent of the corn has so far been planted in the state. There is yet time to plant corn, and with an average season secure a fair yield of grain. Former residents of Missouri know that several years ago corn was planted in late June and July and made excellent crops. So we need not fear that we shall not have corn bread next year. Nor need we fear that all we hear about a short corn crop will come true.

CLIMATE AND CROP REPORT

WEATHER AND CROPS.

From the San Francisco station of the weather bureau the general summary for California furnished by G. H. Wilson, assistant section director in charge is as follows:

The temperature was slightly above normal during the latter part of the week. Light rain fell on the northwest coast and in the northern portion of the Sacramento valley. Fires caused considerable damage to wheat fields in Yolo county.

Grain harvest progressed rapidly in nearly all sections, and thrashing has commenced in some places. In Southern California the yield of wheat and barley is reported heavier than for many years and the grain of superior quality; in some districts the crop is said to be nearly double early estimates. In the central and northern sections early wheat is of good quality and the yield about average; barley is reported a heavy crop in most places and of excellent quality; late wheat will yield a very light crop. The hay crop is below average in nearly all sections except Southern California, but is of good quality; baling is progressing rapidly. Sugar beet harvest has commenced. Beans are making good growth, and there is a larger acreage than usual in some sections. Hops are doing well, but the crop will be light. Corn, potatoes and vegetables are in good condition.

Vineyards are unuasually thrifty, and prospects are good for large yields of raisin, table and wine grapes. Deciduous fruits of all kinds are rapidly maturing and the markets are well supplied. Fruit drying and canning are progressing.

* * *

In the Sacramento valley, especially Yolo county, fires destroyed much grain. Pears and prunes big crop. Grapes in fine condition.

Coast and bay counties are yielding much lighter hay and grain crops than anticipated. Early apples at Hollister are ripening and of fine quality. Almonds and walnuts at Cloverdale are filling out well.

* * *

In the San Joaquin valley the summer fallowed grain proves far better than the winter plowed. Stock in good condition. Irrigation water plentiful.

In Southern California the grain is heavier than anticipated. In the El Cajon valley the output will be 50,000 sacks. Lima beans are making good growth. Mustard at Lampoc damaged by bugs. Walnuts and apples dropping badly. Citrus crop promises to be good.

The appropriation of $10,000, made by the recent legislature for preservation, improvement and maintenance of the California Redwood Park, in Santa Cruz county, is to be used in building roads, bridges, etc., and for the employment of a warden and necessary assistants, $5,000 to be available during this year and $5,000 in 1904.

The Cultivator in its advertising columns this week announces the advent into California of a northern firm. Sims & Son have the sole agency for the state for the Duplex step ladder, a fruit pickers' ladder, that has been very successful in Washington and Oregon. W. B. Sims in a three weeks tour in Southern California has sold three car loads of the ladders to the trade. The firm of Sims & Son have opened wholesale quarters on East Second street, Los Angeles, and will soon open like quarters in San Francisco.

Cut worms are reported as still being very destructive in Sutter county.

Farmers in La Habra valley are harvesting about fifty sacks of potatoes per acre and are getting from 90 cents to $1.00 per hundred pounds for them.

The season's apple crop in the Pajaro valley is now predicted to be a record yield. The Parjaronian estimates the output this year at 1,500,000 boxes.

Coulson's Egg and Feather Food

Coulson's Egg Food is a highly nutritious and palatable food. It is a blending of several different food materials, in such proportions as to best furnish the necessary elements to fully nourish the body and promote egg production. It is to be mixed with warm water and fed twice daily.

Large poultry raisers anticipate to commence feeding Coulson's Egg and Feather Food much earlier this season than heretofore, in order that they might shorten the time of moulting and have the hens in laying condition when eggs are high.

Coulson's Egg Food is a great feed for hens, to produce eggs and feathers.

Hens can be made to moult much quicker and go to laying sooner by feeding them Coulson's Balanced Ration Egg and Feather Food.

Keep Them at It.

The hens that are fed on Coulson's egg and feather food will be laying long after their poorly kept neighbors have laid out and gone to setting.

Coulson's egg food makes hens lay longer, makes hens lay more eggs, and keeps them in better condition.

It takes food to make eggs. To know what to feed a flock of hens or chicks requires study and attention. It also depends on whether you are

feeding for eggs, or for fattening for market.

Laying hens should be fed all they want without stuffing them. They should be fed on egg-producing food. When the hens are shelling out the eggs at a lively rate, and their actions show that they are not getting enough to eat, then increase the amount.

To have hens to lay eggs freely in the late fall and early winter is not the way hens usually do, unless we take special pains to get laying hens at this season.

The hen should be fed once or twice daily on Coulson's egg and feather food to give them good bodily strength and vivacity, and to enable the laying hens to moult early and quickly and to have a nice glossy plumage.

The haphazard method of rearing poultry which was in vogue in the days of the cythe and cradle will not do as a companion of the improved machinery of today.

Science and balanced rations are the guides to success. Not only in getting more eggs, but also in keeping the fowls strong and healthy and not allow them to become too fat and broody.

Process of Moulting.

Many fowls will soon commence to moult and fowls that have been and are fed on Coulson's Egg and Feather food will complete their moult in the shortest time.

The moult is a strain on the vitality of any fowl. Besides maintaining the body, the food must furnish material for the new pulmage, and unless the food contains the required components in adequate quantity impairment of health is certain. When a fowl is in fine health at beginning of moult and is judiciously fed throughout its course, the growth of the new plumage is rapid, its appearance simultaneous with the falling off of the old plumage and the bird may never appear worse than a little rough-coated at any time during the moult. But when the fowl's health is impaired at beginning of moult, or when the food furnished during the moult lacks adequate quantities of the proper constituents, large patches of the surface of the body may be bare of any plumage for a long time from the old feathers having dropped off before traces of the new plumage appear. Fowls may even become quite fat during the moult without having new plumage developed normally, because their food has great excess of starchy and fatty constituents and great lack of protein and minerals. It will usually be the question of the age of the fowl whether the plumage is delayed or the fowl's health impaired my improper food. A young bird will have a tendency to make plumage at expense of health, while an old bird's body will be nourished in preference to formation of plumage. Generally a young bird will moult earlier than an old one.

For several reasons it is important to every poultry keeper that his fowls shall moult under the best possible circumstances as to their own condition, and also at the most convenient and desirable season of the year. Any one keeping fowls for eggs surely needs eggs in fall and winter, when prices are highest, and it is usual for all egg production to cease while the moult is in progress. The fancier who exhibits, desires the moult completed at the earliest possible date, especially if he exhibits at fall shows.

Many experienced poultry keepers state that the moult is a purely natural process, uncontrollable as to season and duration, subject only to individual characteristics of each bird. Control of season and duration of moult are possible, irrespective of age or date of hatching, and it is my purpose to outline herein the measures necessary for doing this.

Perfect health and condition of fowls, freedom from damp and dirt in houses and absence of lice are essential to any control of moulting.

In the early hot days of July the fowls begin to lay with comparative infrequency. Then begin to force the moult. The fowls are restrained so as to be entirely unable to forage. Small rations should be served gradually decreased, until about the third day the birds are receiving only about half one ordinary meal per day. About the fifth day I slightly increase the food, and about the seventh day—if matters appear satisfactory—set the fowls free.

After this feed the fowls all they will eat twice a day of Coulson's egg and feather food and be sure to give them plenty of green stuff; also give them a little of Coulson's No. 3 condition powder in with their feed two or three times a day.

Follow above instructions, and your fowls will finish moulting in 60 days,

and will be ready to lay when eggs are high.

If your grain dealer hasn't got a supply of Coulson's egg and feather food, send in your order to factory and have it sent by freight for you will surely need it.

COULSON'S LICE KILLER

Now is the season for lice. Better get a five-gallon can of Coulson's Lice Killer and keep the lice thinned out.

Coulson's Lice Killer will make short work of all kinds of lice, bugs and insects.

Coulson's Lice Killer penetrates the wood and kills the nits or eggs of lice.

Coulson's Lice Killer leaves behind a powder which is also death to lice.

Coulson's Lice Killer is clean, It does not spoil the plumage of fowls.

Coulson's Lice Killer is a good disinfectant.

Coulson's Lice Killer will kill bed-bugs.

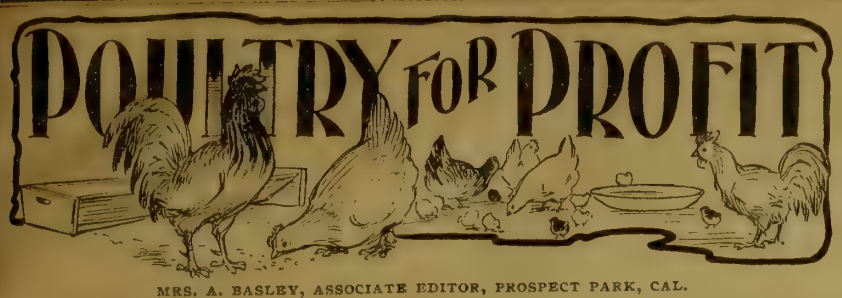
Coulson's Lice Killer will kill flies on cattle or horses.

Coulson's Lice Killer is what you need. Price, One Gallon, 75 cents; Five Gallons, $3.25.

SPECIAL OFFER—Five-Gallon Can sent prepaid to any station in California for $3.50.

A. R. COULSON

772-774 Main St., Petaluma, Cal. Long Distance Telephone, Black 1303



MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

WOMAN'S WORK IN THE POULTRY YARD.

Moulting.—Last week we considered the welfare of the young stock and decided that freedom from lice and never overcrowding were essential in keeping the chicks growing. This came under the head of comfort. The fact is, the three essentials for success in raising any kind of animals properly are comfort, exercise and proper food.

Comfort, exercise and proper food will, in the human family, give health of mind and body, whilst in the poultry yard these three are necessary for the greatest egg yield, the finest growth, and the best success. In fact, with any one of these lacking, failure will be the result.

This week I want to consider the moult. Last year I read with the greatest interest the account Mr. Van Dreser of New York gave of his method of controlling the moult. He claimed that he made his hens moult whenever he wished. He had discovered how to force the moult, making them moult when eggs were the cheapest. His plan was to cut down the feed to about half one meal per day for two weeks until the hens became quite thin, and then to feed them heavily with stimulating food, when he said the feathers would drop out and new feathers would quickly grow. His argument was that when hens sit for three weeks on eggs and raised a brood of chicks they moulted quickly, because they had grown thin and afterwards had the nourishing food the little chicks were fed and this helped on the moult.

His argument seemed plausible and I decided I could be as smart as Mr. Van Dreser, but my bump of caution led me to make a trial of only a dozen hens. This trial dozen I put on short rations in June, to make them thin, stop laying, and prepare for the moult.

A quick moult usually takes sixty days; from sixty to one hundred days is the duration of the moult. When my trial dozen of young hens had fasted two weeks they still continued laying (mine are indefatigable layers), but were quite thin. I then proceeded, Van Dresser fashion, to feed them up, with feather making food, and was pleased to see feathers dropping freely, but the eggs still came as freely as ever. In about six weeks the hens commenced to feather out, and stopped laying. They soon looked beautiful. I felt quite as elated as Mr. Van Dreser, but, like him, was doomed to be disappointed, for although they laid a few eggs in October I soon noticed something was wrong, for they all began to moult again and instead of having but one moult that dozen hens had two moults, lasting in all nearly nve months, and I learned again by sad experience that it does not pay to go contrary to nature.

"You have acquired a powerful sight of information," said one man to me, "but you have had a big price to pay for it."

I hope some of my exerpiences may help others, even if they were costly and sad for me. I have since read that Mr. Van Dresser finds that trying to force the moult is not the success he anticipated and he no longer practices it.

Trying to force nature, is apt to result disastrously, but assisting nature, as the homeopaths advocate, is quite possible. That is usually what I try to do at moulting time of all others. The moult has a paralyzing effect upon egg production, especially upon the Mediterranean breeds, and I want to assist nature to get rid of the old feathers and on with the new. This is the problem and this is largely controlled by the food. Here proper food is even before comfort. Proper food is the food that contains the elements of feathers; the protein must be increased, more animal food must be fed and, to enable the hens to digest the animal food, a plentiful supply of green food is desirable. I have always added linseed meal to the mash during the moult, but this year I intend trying cotton seed meal, because I find by its analysis it contains more protein than linseed meal, and the fowls like it better.

They require a large supply of grit, shell and charcoal, and when fed a mash should have once a week a little sulphur added or one of the many poultry tonics, and above all, they must be kept entirely free from lice or mites. Giving them a good washing in warm soap suds and afterwards rinsing them in water to which some Chloro Naptholeum has been added, will kill the lice, help the feathers to come out and bring in the new feathers clean and glossy. If a hen has lice they will eat into the tender sprouting of feathers so that there are little rows of holes in the webbing, spoiling all chances of winning a prize.

The males should be taken away from the hens, and if required for next year's breeding should be kept in pens separated and where they cannot see the females. Those not required for breeding should be marketed as soon as possible to save feed, also to prevent their annoying the hens, and to make more room for the growing pullets.

* * *

ANSWERS TO CORRESPONDENTS.

I have noticed in the papers an account of a hen in New Jersey that lays two eggs a day. Do you think this possible? Mrs. J. F. Y.

Ans. This came out as an April fool joke, and it took in a number of people both East and West, and I am sorry to say has been copied into reliable papers for a fact. It is not possible, and is not true. [We trust no very reliable farm papers copied the item for a "fact" and for fear some one may ask Mrs. Basely regarding the electrical appliance which makes California hens lay three eggs a day, we will say that the blamed thing isn't working just now—Ed.]

* * *

Will you please tell me again the name of the liquid for keeping eggs. J. R. B.

Ans. I suppose you mean the soluble glass, silicate of soda (sodium silicate). It can be procured at any good drug store. In regard to this I yesterday poached some eggs that had been put into this liquid nearly four months ago—on the tenth of March. The eggs are in excellent condition, firm and good, the whites are as creamy as new-laid eggs, but fancied that the yolk of one tasted a little flat: the other I should not have known to be over a day old. I advise you to try putting down several dozen as an experiment.

hens, mostly Leghorns and Minorcas, writes that he has been having poor results. only getting about one hundred and seventy eggs per day. Wants to know what the egg yield from eight hundred hens should be and whether fruit of any kind, especially prunes, will prevent hens laying.

Ans. The Mediterranean breeds lay profusely in the months of March, April and May. The egg yield from eight hundred of those hens during those months should not be less than four hundred per day, but I fear he has too many hens for his space. I would advise him to sell off half, and to examine carefully for lice, change the feed, giving the mash at night, and to make the hens scratch all day for their living.

I have never found fruit of any kind to prevent my hens laying. Would like to hear from others on this subject.

* * *

I am receiving many letters asking for description of the turpentine weed and how it may be recognized.

It is a small weed six or ten inches high at present, the blossoms come in about three or four weeks, they are blue. The weed smells exceedingly strong of turpentine when crushed. I do not personally know of any sale for it, and I would not like to sell any until I have made a very thorough trial of it to prove its worth.

OVER-CROWDING POULTRY.

There is no graver danger to fowls than crowding too many in too small space. Not only do a number of diseases result from this course, but the hens will not lay as well, and the profits in consequence are greatly diminished.

It is natural when a poultry keeper makes a fair margin of profit for the year to wish to add to it the following season by increasing the number of his fowls. This is sometimes done without enlarging his buildings and yards sufficiently, and the dangers of overcrowding incurred in consequence. Now that so many make a living from scientific poultry keeping in large or small plants, a poultryman cannot afford to overcrowd or neglect his fowls, for he is in general competition with these plants in marketing his chickens or eggs. Of course, no matter how large a number of fowls are kept in a henhouse some will lay, but there is nothing like the egg yield there would be should other methods be used.

Overcrowding is quite often accompanied by under feeding, particularly as there has been so much written about the danger of too much food for laying hens. This advice is undoubtedly correct, and a medium course in feeding should be followed, but it would seem that it were best to be on the side of over feeding rather than the reverse. It is surely true that a hen cannot produce eggs if she is not given the food to do it with, and in the anxiety not to over feed her she may not get sufficient food.

It seems to take all the ambition out of a hen to have too many of her own kind about her. Why should she lay eggs to hatch out chickens (for that is what a hen lays for, and not to realize so much money per dozen for them) when there seems to her no room for them to live or grow in? Again, where there are too many in a yard there is less likelihood of finding tid-bits by hunting for them, so a hen will stand around waiting for feeding time. It would seem to be the best plan to keep only a moderate number of hens in the different yards, to keep them out of sight of those in other yards as much as possible, and to give each yard of fowls a chance at free range every now and then, or at any rate a run in a larger space.

There is far more profit in a smaller number of fowls well kept than in a large number poorly managed, and in this poor management overcrowding has a prominent place—American Poultry Advocate

---

The poultryman who does not know which of his hens are the best layers is not as well acquainted with his flock as he should be. It is the drones in the flocks of this country that keep the average down to sixty eggs a year.

"If I'm not a little more careful," said the hen, as she discovered a china egg in her nest, "I shall be laying bricks next."

CEMENT FLOORS FOR CATTLE.

While there are many people who contend that cement floors are unexcelled for cow stables, we begin to think that this opinion is not altogether correct, says Farmer's Sentinel. It has been noted that where cows lie upon cold cement and are not allowed a deep bed of dry straw or other litter that their udders become chilled and affected with mammitis. No matter how well one may bed cows they are apt to get the litter out of place so that the cement is laid bare and when this occurs trouble is sure to follow. In finely bred dairy cows there seems to be a delicacy of the skin of the udder which makes it peculiarly liable to congestion and inflammation and we have traced to the cement floor many chronic cases of garget which could not otherwise be explained, and which have subsided when the cement was covered with boards. We also notice that Prof. Carlyle of Wisconsin claims that cattle are subject to rheumatism when standing on cement floors and that this disease has disappeared since he covered the floors with wooden gratings, which are easily removed for the purpose of cleansing the stalls. There are but two of the bad results following the use of cement floors. We have seen a good many cases of abortion from slipping on such floors and not a few cases of fracture of the pelvic bones from falls received on the slippery surface offered to the feet of cattle and horses. It is, however, a difficult matter to suggest a fit substitute for the cement floor if done away with, for cement is easily kept clean and other floors absorb liquid excreta and are apt to become foul in summer time. To us this seems chiefly a matter of bedding. If the bed is deep, and kept dry the cement floor will do little harm, but where the straw is grudged or thinly laid on the cement is sure to become bare and hurtful.

STRONG POINTS OF DAIRY BREEDS.

Hoard's Dairyman gives the following points of superiority in certain breeds of cattle, or rather the breeds which are strongest in certain characteristics. The points given are from observations made by Dr. J. M. W. Kitchen (1) To breed true to race type, he places the Holsteins first and the Jerseys second.

(2) "In highly evolved dairy form and function" Dr. Kitchen places the Jerseys first and the Holsteins second.

(3) "In power to make the best use of a certain amount of food" Guernseys first, Jerseys second and Holsteins third.

(4) In ability to stand high-pressure feeding for considerable periods, "the greatest yearly and life-long profit," Jerseys first, Ayrshires second and Holsteins third.

(5) "In power to produce the richest milk, the Jersey averages highest, Guernsey second."

(6) "In rich coloring of milk, the Guernsey stands first, while the Jersey takes second rank."

(7) "In highest average of individual excellence, I consider the Jersey stands by far at the head, while the Holstein stands next. The average Jersey is certainly the most highly evolved dairy cow on earth."

(8) "The largest producers of a low fat per cent. milk," Holsteins first. Ayrshires second,

(9) The author is uncertain whether to place the Holstein or Ayrshire first in hardiness, and adds: "Other things being equal, the cow that uses up the most of the blood she makes in producing milk is the least hardy."

The gentleman who gave up his seat to a lady on an elevated train, afterward found out that she had been robbed while occupying it.—Puck.

JERSEY NOTES.

It will be observed that in another column appears announcements of a number of members of the Jersey Breeders' Association of Southern California. This association is an organization to advance Jersey interests in the southern end of the state. That it has done it in its two or three years existence goes without saying.

That it will do still more during the coming year is equally evident. One step in that direction is the arrangement with this paper for a full column of space to be used by members for one year. This manifests that these men have faith in the stock which they are pushing as the highest type of dairy cow in existence.

In that column will appear the announcement of members only. The standing of these members as careful breeders is assured for the association stands for careful breeding and square dealing.

Any one wishing first-class stock of this breed will do well to scan that column. It will have some interesting announcements.

Members of the association are anxious for the fall exhibit and butter fat test. We trust the committee will give us some definite information for the next issue.

D. G. Whiting writes us from the "desert" at Imperial in which he speaks of his observations of the work of his magnificent bull Lowland Lad. He says:

I thought all the time I had a great bull, and time is proving him to be a great breeder and worthy to mate with the rare daughters of Pedro's Prince Primrose. The Cultivator gets good words at every opportunity.

A. B. White is offering an exceptionally fine lot of registered stock at private sale this week. We are sorry to state that Mr. White will retire from the breeding business. This is made necessary by encroachments of the city, high priced residence lots and dairy restrictions now reaching up to the edge of Mr. White's little ranch. So Mr. White is now offering his entire stock for sale. His stock comprises the St. Lambert, Melia Ann, Marigold, and Brown Bessie families, headed by the pure St. Lambert bull, King's Victor king of St. Lambert." Will sell separately the herd of bulls, cows, young bulls, if desired, or will sell all together.

Mr. White has had Jerseys since 1884, started a herd here in 1895, has brought 21 animals in single crates by express over the mountains, and widely distributed them and their increase to some of our best herds.

Vela Hastings, 119615 A. J. C. C., recently dropped a fine heifer calf by Marigold Holyoke, 49594. Judging from the way this sire was bred up, this heifer should prove even better than her dam, which means a good deal, as Mr. Leffingwell says Vela Hastings is going to crowd 500 lbs. of butter pretty hard this year.

DAIRY ITEMS.

J. B. Raitt, of Santa Ana, is adding a 1750 pound Alpha separator to his already extensive plant.

S. S. Farnsworth, of the Santa Ana creamery, is putting in a skimming station near Westminster. He has ordered an Alpha separator from Wickson & Co.

Eeven with the six car loads of eastern butter now being shipped to Los Angeles to be put in cold storage, the probabilities are there will be a shortage of nearly a hundred thousand pounds next January and February.

The new creamery owned by Alexander & Knoch at Susanville, began operations July 1.

The Dos Palos skimming station has recently been acquired by a Rochdale company, and it is stated that the plant will be enlarged to a full creamery as soon as possible.

WILL SAVE FARMERS MONEY.

G. E. Colby, of the California University, is issuing a bulletin giving farmers directions whereby they may save a vast outlay in spraying compounds for orchards. He has found that it is possible to use other substances than Paris green in compounds for killing pests. His substitutes have greater efficiency and will cost much less than the Paris green, which has been hitherto used almost universally.

Dr. Colby has done away with the use of costly copper oxide, and made several cheaper substitutes. Another feature of the new compounds is that they do not have to be constantly stirred to preserve their effective qualities. The practical horticulturist can now produce a compound of arsenious acid and white lead or lime at one-seventh the cost of Paris green. The mixture soon cures the trees.

FLY TIME.

Just as we congratulate ourselves over the increased milk flow from good pastures the flies hatch out and hunt up the cattle for breakfast and lodging. What are you going to do about it? Just let old Brindle stamp and switch and slam her head around? Well, if she's lively, this procedure will keep the flies busy, but it will take a lot of milk to do it. Milk is the most expensive fly repellant you can invest in. Some dairymen keep their cows in a darkened stable—flies are afraid of the dark—and allow the cattle to graze at night. This means a special stable equipment and more or less feeding. When pasture is plentiful we like to give cows all they want of it. We have been fairly successful with different spraying mixtures, a gallon of kerosene to a quart of fish oil with an ounce of carbolic acid added being the cheapest and most effective. It should be put on in the morning with a 50-cent hand sprayer (larger for larger herds), and to be completely effective should be applied daily. A few minutes will suffice for each animal. The head, neck and shoulders and fore parts out of reach of the tail should be especially treated. Many flies can be killed in the process of spraying, and after a few day's application the cattle will feed quietly in the heat of the day during the fly-pest months, without any worry whatever. The fruit men have found that there is no profit in their business without spraying and the energetic and thrifty dairyman must join the procession. Let us spray.—Rural World.

SKIM MILK FOR PIGS.

Oats, bran and shorts are good muscle-making foods, but for weaning there is nothing like skim milk. Many farmers seem of the opinion that it is not profitable to raise two litters, the principal reason being that they cannot be made to grow materially during the cold weather. Up-to-date dairymen have learned of the importance of taking good care of their cows in winter, and if an equal amount of care and attention is given to the pigs they cannot help but grow from March to July.

CAUSE AND CURE OF COLIC.

One of the most fruitful causes of colic is the too common habit of allowing horses to partake of large draughts of water immediately after finishing a feed of oats. There is no surer way of generating an attack of colic than this, the reason being that when a large quantity of water is thus imbibed it has the effect of carrying into the intestines some of the freshly eaten grain. This grain, being still in a raw and undigested condition, its effect when it reaches the intestines is to give rise to the irritation and inflammation which are the immediate causes of the colic. In dealing with cases of this kind the most obvious course to adopt is to take precautions to prevent the animal from drinking large quantities of water under the circumstances just referred to. When an animal falls a victim to an attack of colic, the best thing to do is to administer a dose consisting of one ounce of laudanum and two ounces of sweet spirits of nitre along with half a pint of whiskey in some hot water.

Very often simple cases of colic yield to the administration of a couple of ounces of cooking soda, diluted with water, and given as soon as the first symptoms of the attack are noticed. Should the administration of this cooking soda fail to give the desired relief, no time should be lost in following it up with the laudanum and spirits of nitre already suggested. —Ex.

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

CHRONIC COUGH.

My dog, a Pointer, has had a bad cough for over two months. It seems to be in his throat.

He coughs most in the early morning after I have let him loose.

He seems in good spirits and eats well but doesn't get very fat.

The cough is harsh and deep and seems as though he were trying to get something up. What do you think ails him, and what had I better do?—Subscriber.

Get a pint bottle of Turpine Hydrate and Codeine Sulphate. Give one teaspoonful three times a day.

SLOUGHING WOUND.

Editor Cultivator: One of my mares has a running sore between under jaw bones; has been running for over a year. I thought it was caused from some grass seed, like wild oats, but it is not. I tried curing it with a liniment made of eggs, turpentine and vinegar, but it would not heal. She is healthy, strong and keeps in good condition and eats well. Would like a remedy to cure same.—Sub., Laytonville, Cal.

There is some foreign matter in the wound that prevents its healing. Cut the wound open, probe it thoroughly with the finger and remove the offending object and it will heal kindly by the application of a little antiseptic daily.

COUGH.

Editor Cultivator: Have a horse that has a light cough somewhat like heaves, and am afraid he is coming down with same. Please give something on symptoms of heaves and what remedies to use to prevent and cure same.—Sub., Willits, Cal.

Heaves or emphysema is characterized by a hollow cough, never loud. The muscles of the flank give a double jerk at each inspiration. Avoid all dusty or mouldy hay and keep the bowels in good condition. When heaves is once well established there is no cure for it. The distressing symptoms can be relieved by giving one ounce of Fowler's solution of arsenic once daily.

THOROUGHBRED BERKSHIRE HOGS

Vermont Farm Machine Co., Bellows Falls, Vt.

JUST BE GLAD.

O heart of mine, we shouldn't
  Worry so.
What we've missed of calm we couldn't have
    you know;
What we've met of stormy pain,
  And of sorrow's driving rain,
We can better meet again,
  If it blow
We have erred in that dark hour
  We have known:
When the tears fell with a shower;
  All alone.
Were not shine and shower blent
  As the gracious Master meant?
Let us temper our content
  With His own.
For we know not every morrow
  Can be sad;
So, forgetting all the sorrow
  We have had,
Let us fold away our fears,
And put by our foolish tears,
  And through all the coming years
Just be glad.

—James Whitcomb Riley.

BREAK, BREAK, BREAK.

Break, break, break,
  On thy cold gray stones, O Sea!
And I would that my tongue could utter
  the thoughts that arise in me.

O well for the fisherman's boy
  That he shouts with his sister at play! !
O well for the sailor lad
  That he sings in his boat on the bay!

And the stately ships go on
  To their haven under the hill:
But O for the touch of a vanished hand,
  And the sound of a voice that is still!

Break, break, break
  At the foot of thy crags, O Sea!
But the tender grace of a day that is dead.
  Will never come back to me.

—Tennyson.

THE PASTURE KNOLL.

It was a dreary afternoon, and the light was waning. A timid ray, struggling through the west window, yet lingered in Nancy Allen's kitchen as though loth to leave her alone. She was standing by the window, anxiously peering out into the growing shadows. A tattered white rag, flapping dismally from one lone cherry tree, was the only visible apology for life.

"Per'aps there'll be a light, yet," she faltered; and she felt a grain of comfort from the wavering hope.

Nancy drew towards herself a chintz covered rocker; but she did not sit down.

"Reckon I'll see it sooner if I stand;" and there she remained, withone hand on the windowsill, peering out into the gathering gloom.

Occasionally she uttered a piteous little wail, "Poor Sarah!"

Long she stood there motionless, but still no light appeared in the weather-stained cottage on the hill.

"'Tain't no use," she murmured.

Reluctantly she turned away and slowly bent over to straighten out the worn braided rug at her feet.

"I guess she's gone, else there'd be a light. Mary never could bear to stay in the dark. She was always rather timid, ever since she was a little mite."

Nancy's hand trembled perceptibly as she lighted the lamp. She was strangely moved!

"Reckon I don't need any supper; but suppose she should come for me to set up. I should feel sort of faint before mornin'. Perhaps I'd better eat a bite, an' be all ready."

Nancy then went to the cellarway, and got a broken tumbler of currant jelly and two slices of wheat bread. These she placed on one end of the kitchen table—the other end was covered with rags cut into narrow strips for a new rug.

"Presume if I should set up, I'd feel the need of a cup of tea;" and Nancy hastened toward the little closet at the other end of the room, where she kept the remnant of her mother's purple and white china tea-set, the teapot, and the bone-handle knives and forks which she had had when she was married. After the teapot was placed on the stove, Nancy again went to the window and peered out.

"There hain't one speck of light. Oh, Sarah! an' you won't let me share it with you;" and Nancy sighed sorrowfully, as she sat down to eat her scanty meal.

Nancy Allen had eaten alone for two years, ever since her husband was brought home in a half-unconscious state from the accident at Joel Tyler's barn-raising.

Just before he died, he whispered to Nancy, "Bury me over on the pasture knoll. Then I can be in sight of —home. I always wanted to be buried there, it's so peaceful; and I'll—wait—there—for—you—Nancy."

"Yes, William, 'twill be just as you wish; an' you'll be near to Sarah's, too," sobbed Nancy; but her husband didn't hear her answer.

Sarah Wilson and her daughter, Mary, lived up on the hill, opposite the pasture knoll. The Allen land extended some little distance in front of the Wilson farm, on the opposite side of the road. The pasture knoll, a delightfully picturesque spot was just across the road from the Wilson house. The two families had always been the warmest of friends; indeed, they seemed almost as one family.

"What belongs to me, belongs to you," Sarah often declared to Mrs. Allen; while she in turn, always replied: "If I have anything you want, Sarah, an' you don't find me at home, you just walk right in and get it—you know where the key is."

"I don't see what Nancy Allen can be thinking of, Mary," declared Mrs. Wilson, excitedly, the day after Mr. Allen's death, "to be making a graveyard right in front of our house."

"Why, Mother, you're not afraid"—began Mary.

"Afraid! course not," interrupted Mrs. Wilson. "I don't mind it so much for myself, but 'tis the property I'm thinking of. 'Twill spoil the sale of it; an' Nancy Allen knows it! Who'd want to buy a farm with a graveyard right in the front door! If she treats us so, I'll never have nothing more to do with her—never. As tho the graveyard where other folks is buried hain't good enough for William Allen."

"Why, Mother," replied Mary, looking up from her dishes; "I don't see as it will make very much difference. We don't want to sell the old place and, if we ever do, nobody who wanted to buy it would stand out for a grave on somebody else's farm."

"You don't understand it," sobbed Mrs. Wilson. "We've always been like sisters, and to think that she would hurt my feelings a-purpose. I told her yesterday, when I was setting up there that the other place was just's good; and she said as calm-like—she knew 'twas hurting my feelings—'Sarah, I must carry out the wishes of the dead.' "

So they had not spoken since the funeral.

Nancy went many times to her old friend's, "to reconcile us again," she said to herself; but her knock was never answered. Then Nancy would go down to the pasture knoll and wait; but Sarah never appeared.

It was very lonesome for Nancy living alone in her cheerless home. She often drew up her chair to the window so she could see Sarah's light.

"It seems most's tho Sarah was here of an evening when I see that light," sighed Nancy to herself. Often she would go to the pasture knoll for company.

"I can be near them both, then," she said, as she trudged wearily up the hill.

On one of her lonely pilgrimages she met a neighbor who had just come from Sarah's.

"Goodmorning, Mis' Allen! Going up to see Mary Wilson? She's pretty bad off, no mistake! It comes rather tough on her mother, being all alone."

Nancy replied, half to herself: "An she didn't let me know."

Drawing her shawl closer arond her frail form, she hastened on up the hill. To her timid knock—how strange it seemed not to go right in—the door was opened by Sarah.

"Oh, Sarah, how is Mary?" asked Nancy, anxiously.

"'Bout the same, Mrs. Allen," answered Sarah, shortly; and she was about to close the door.

"Can't I come in an' do something for you? I want to be just the same's we were before. Oh. Sarah—can't we?" and Nancy extended her little mittened hand, tremblingly.

"I don't know's I hanker to be friends with folk that hurt one's feelings a-purpose. I can get along well enough;" and Sarah turned abruptly and closed the door, leaving the poor Nancy amazed, and almost frightened at her sternness She slowly started home; but when she reached the pasture knoll she waited a moment. There was no indication of a grave.

"With no stones," concluded Nancy, "it won't seem so hard for Sarah. Oh, William, she sobbed, "would you have minded being buried in the other place, if you had known how Sarah'd feel?"

For a week she anxiously watched the light on the hill; now there was no gleam from the window. Often, during the evening, she thought she heard Sarah's step; but it was only the leafless branches of the maples swaying against the rafters. There was a step at last—of a neighbor's lad.

"Mary Wilson's dead; thought you'd want to know."

Long sat Nancy murmuring: "Poor Sarah!" All at once she started. "Perhaps 'twill reconcile us—if she'll do it! "

Mournfully the clock ticked, while Nancy painfully penned the homely note, so full of love and sympathy.

"Dear Sorrowing Sarah: I just heard 'bout it. If you'd like, you can bury Mary, just's well's not, right on the pasture knoll. It won't seem so hard to you—for she'll be kinder near home. An' you can look right where she is. I thought it wouldn't be quite so lonesome for her, being near you—and William.

"I love you well's ever.

NANCY."

She folded the note with her trembling fingers, then hurried out into the dark. She didn't stop this time at the pasture knoll, but hastened on toward the house opposite. When she reached the front yard she hesitated and whispered brokenly: "If Sarah'll only do it." Then she noiselessly groped her way to the doorsteps.

"I'll slip it right under the door, an' Sarah'll find it in the morning."

The next afternoon Nancy noticed two men digging on the pasture knoll.

"Sarah'll be reconciled now," she said, eagerly—"Sarah'll be reconciled now!"

But all that day Sarah never appeared. Nancy simply waited.

"She'll come some time," she faltered.

That night after the funeral Nancy felt so lonesome that she started for the pasture knoll. Some one was kneeling by the new made grave. Her head was bowed, and she was talking to herself. Nancy approached cautiously, and knelt down by the other grave opposite. The dark robed figure remained motionless.

"Nancy was so good, Mary! You don't seem gone, now, but only as if you'd stepped out here to rest—and you won't feel lonesome. Oh, Mary, will she forgive me?" and with a sob, Sarah raised her head.

"Nancy," she cried, "can you for"—

"Oh, Sarah!"

And two sad lonely hearts were reconciled on the pasture knoll.—N. Y. Independent.

FRUITS AS FOOD AND MEDICINE.

That fruit has many uses besides pleasing the taste is well known, but the exact properties of each kind are not so well understood by the consumers, and a few suggestions on the subject may not be amiss, says the Christian Work.

Fruit alone will not sustain life for any great length of time, but helps to furnish a variety in the diet.

It stimulates and improves appetite and digestion, relieves thirst, and introduces water into the system, acts as a laxative or astringent, stimulates the kidneys, and supplies the organic salts necessary to proper nutriment.

Among the laxatives are figs, prunes, dates, nectarines, oranges and mulberries.

The astringents are blackberries, dewberries, raspberries, pomegrantes, quinces, pears, wild cherries, cranberries and medlars.

The kinds used for diuretics are grapes, black currants, peaches, whortleberries and prickly pears.

The refrigerants are red and white currants, gooseberries, lemons, limes and apples.

Apples are useful as a stomach sedative and will relieve nausea and even seasickness.

Grapes and raisins are nutritive and demulcent, making them excellent for the sickroom.

It is sometimes difficult to keep raisins, figs and dates away from the inquisitive little ants and roaches, but this is easily accomplished by putting them in paper bags that have been well brushed over with strong borax water and dried before the fruit is put in. The little pests do not like the borax and will not gnaw through the sack when thus prepared.

A fig split open makes a good poultice for a boil. It is especially good for gum boil. A split raisin is also good.

Lemons are useful in health or sickness. Hot lemonade is one of the best remedies in an incipient cold. It is also excellent in case of biliousness. For malaria the "Roman cure" is prepared by cutting the rind and pulp of a lemon into a pint of water, then boiling it until there is only a half pint. One teaspoonful is taken before each meal. This has cured obstinate cases when quinine failed.

Lemon syrup made by baking a lemon twenty minutes and then squeezing the juice upon half a cupful of sugar is excellent for hoarseness and to break up a cold.

A habit of looking for the best in everybody, and of saying kindly instead of unkindly things about them strengthens the character, elevates the ideals, and tends to produce happiness. It also helps to create friends. We like to be with those who see the divine side of us, who see our possibilities, who do not dwell upon the dark side of our life, but upon the bright side. This is the office of a true friend; to help us discover our noblest selves.—Ex.

"Boarding school."—Yes; Seres is the goddess of continued stories.

THE RIGHT KIND OF A BOY.

The other morning we were in the midst of a three-day's rain. The fire smoked, the dining-room was chilly, and when we assembled for breakfast papa looked rather grim, and mamma tired, for the baby had been restless all night. Polly was plainly inclined to fretfulness, and Bridget was undeniably cross, when Jack came in with the breakfast rolls from the baker's. He had taken off his rubber coat and boots in the entry, and he came in rosy and smiling.

"Here's the paper, sir," said he to his father, with such a cheerful tone that his father's brow relaxed, and he said, "Ah, Jack, thank you!" quite pleasantly.

His mother looked up at him, smiling, and he just touched her cheek gently as he passed.

"Top of the morning to you, Pollywog!" he said to his little sister, and delivered the rolls to Bridget with a "Here you are Bridget! Aren't you sorry you didn't go yourself this beautiful day?"

He gave the fire a poke and opened the damper. The smoke ceased, and presently the coals began to glow; and five minutes after Jack came in we gathered around the table, and were eating our oat meal as cheerily as possible. This seems very simple in the telling and Jack never knew that he had done any thing at all; but he had in fact, changed the whole atmosphere of the room, and had started a gloomy day pleasantly for five people.

"He is always so," said his mother when I spoke to her about it afterward, "just so sunny and ready all the time. I suppose there are more brilliant boys than mine in the world, but none with a kinder heart or sweeter temper, I am sure of that."—Epworth Herald.

RECIPES.

Boiled Salmon.—Select a small fish for this purpose, as a large one will not fit the ordinary sized fish kettle. Have in your kettle enough salted boiling water to cover the salmon, and add two-tablespoonfuls of vinegar to the water. Sew the fish up in a piece of firm cheesecloth, and lay it carefully in the kettle. After it begins to boil allow twelve minutes to the pound. When done take out of the water carefully, remove the cloth, and transfer the fish to a hot platter. Sprinkle with pepper and salt, and pour over it a well seasoned white sauce. Garnish the dish with slices of lemon and sprigs of parsley.

Baked Salmon.—Wipe your fish with a damp cloth, but do not lay it in water. Rub with a little salad oil, and sprinkle with salt and pepper. Lay in a baking pan, and dash over a cup of boiling water in which two tablespoonfuls of butter have been melted. Bake, covered, basting every fifteen minutes. When done transfer to a hot platter, and set in the open oven while you thicken the gravy left in the pan with cornstarch wet with cold water, and season it with lemon juice and a dash of onion juice. A little tomato catsup is an improvement. Boil up once and pour into a gravy boat. Send to the table with the salmon, which may be garnished with sprigs of parsley.

Salmon Steaks.—Have the steaks cut about an inch thick. Wipe with a damp cloth and lay in salad oil for an hour. Drain and put upon a gridiron over a clear fire. Broil slowly, rubbing with butter from time to time. They will take at least twenty minutes to cook and must be watched carefully that they do not scorch. When done put upon each steak a generous lump of butter and sprinkle with salt and pepper.

Cold Salmon with Mayonnaise.—Have boiling in a kettle a gallon of salted water, to which a gill of vinegar has been added. Lay carefully in this the salmon steaks, and let them boil very slowly. Test with silver fork, and when done, but not at all broken, lift carefully from the water and drain. Set aside until cool, then keep on the ice until wanted. Lay the steaks on a cold platter, and pour a very thick mayonnaise over them. Spread this smooth with a knife, that the steaks may be covered. Garnish with an abundance of watercress.

To successfully run a seashore hotel requires sand.

"THE QUALITY STORE"

Summer Furnishings

of the right kind to suit men who want to be carefully dressed in every way. Passe styles and exorbitant prices find no favor here. Our men's shirts at $1.00 and $1.50 have no equal. Better qualities for men who like $2.00 and $2.50 shirts.

Los Angeles Markets.

LOS ANGELES, July 2.

Butter continues firm, with good demand. Quotations same as last week.

Berries have gone to the bad. Canners saw the glut coming and cut prices to 2½ cents. This made disposal of surplus at a loss and gave a panicky feeling to the berry men

Watermelons at $1.75 to $3.50 per dozen are yet a luxury, though offerings are readily cleaned up.

The dried apricot market shows a decided upward tendency.

Report has it that most careful estimates are that not over 500 cars will be the year's output. This estimate is doubtless the cause of the upward look. Canners are also buying more freely than usual. Not over 50 cars of the old crop are left on the coast.

SAMSON IRON WORKS STOCKTON CALIFORNIA

San Francisco Markets.

SAN FRANCISCO, July 2.

Dairy.

Butter is slightly easier, though the top quotations are same as last week. Some anxious holders are offering to shade slightly and buyers seem conservative. Cheap grades seem to be in the market in excess which may cause much of the unsettled condition.

Quotations on butter are, per pound:

Creamery, extras	.25	@26
Creamery, firsts	.23	@24
Creamery, seconds	.22	
Dairy, extras	.22	@22½
Dairy, firsts	.20	@21
Store	.18	@19

Cheese remains the same as last week, no indications of change.

Calif. Creamery, mild new, extra	.12	@12½
Calif. Creamery, mild, new, choice	.11	@11½
Young America	.12	@13
Eastern, New York Cream, Chedders and flats	.18	@19

Eggs and Poultry.

Eggs are offered in large quantities and have taken a slight decline. At the quotations below the top quotations are seldom secured and buyers are careful in selecting extra stock. Quotations are:

EGGS—Per doz:

Ranch, selected, large	.20	
Ranch, good to choice	.18	@19
Store	.15	@16
Eastern	.16	@18

POULTRY—Old Roosters, per doz., 5.00@5.50; young Roosters, $8@10; Fryers, $5@6; Broilers, large, $3.50@4; small, $2.50@3; Hens, $4.50@6; Ducks, per doz, old, $3.50@4.50; young, $4@5; Turkeys, nominal; Geese, per pair, $1@1.50; Goslings, $1@1.50; Pigeons, per doz, young, $1.75; do, old, $1.50@1.75.

Fruits and Vegetables.

The demand for fruits continues good. Of course the supply is enormous, so the price rules low. There are, however, continued shipments to northern points which equalize the market and prevents glut.

Apples and pears are coming in more freely. Small stock goes at low prices and slow sales. Large clean stock commands top quotations. The first Bartlett pears of the season arrived during the week.

Cherries are materially falling off in receipt but this does not seem to stimulate expected higher prices.

Coachella valley still supplies cantaloupes, some days noting the arrival of two or three cars.

Grapes are arriving, but are of indifferent quality.

Berries have as yet held firm at good demand.

Vegetable market has proved strong, with top quotations. Old potatoes are in good demand for seed for fall crop with supply getting low.

Quotations are:

FRESH FRUITS—Apples—Green, per bx. common to choice, 25@75; fancy, $1@1.25.

CHERRIES—Per bx: Black, 50@90; Royal Anne, 40@85; white, 35@65; bulk, per lb: Black, 5@7; Royal Annes, 5@6½; White, 2½@4.

PEACHES—Per bx, 50@75; basket, 50@75.

PEARS—Per bx, 35@$1.15; basket, 20@35c.

PLUMS—Per bx or crate, 25@85c; basket, 15@30c, as to variety; Tragedy prunes, 65@85c.

FIGS—Per bx, 35c@$1.25.

APRICOTS—Per bx or crate, 50@75c; basket, 35@50c; bulk, per ton, $20@30.

CANTALOUPES—Per crate, $2.@3.50.

NUTMEG MELONS—Per bx, $2.

WATERMELONS—15@35c.

GRAPES—Per crate: Seedless, $1.50@1.65.

BERRIES—Per chest: Strawberries—Longworth, $6@8; large varieties, $2@3.50; Blackberries, $3@4; Raspberries, $4@8; Loganberries, $1.50@2.50; Currants, $2@3.50.

CITRUS FRUITS—Per bx. repacked: Oranges, Navels, $1@2.50, as to quality; Valencias, $2@3; St. Michaels, $2@3; Seedlings and Mediterranean Sweets, $1@1.25; Lemons, $1@3; Grape Fruit, $1@2; Limes, $5.50@6.

VEGETABLES—Asparagus, per box, $1@2; Rhubarb, per bx, 40@65; Tomatoes, local, per bx or crate, $1@1.75; do, River, large bx, $2@2.50; Green Peppers, per lb, 10@15c; Dried Peppers, 6c; String Beans, per lb, 4@7; Wax, 4@7c; Green Peas, per lb, 4@5c; Egg Plant, 15@20c; Summer Squash, per bx, 25@40c do, bay, 50@75c; Cucumbers, per bx, 40@60; do, bay, $1@1.50; Garlic, per lb, 2½@3½c; Green Corn, per sk, $1@1.75; crate, $2@2.50; Okra, per lb, 25c.

ONIONS—New Silver Skins, per ctl, 65@75; Red, 40@50c.

POTATOES—Per ctl: New Whites, $1.15@1.75; Early Rose, $1.15@1.35; Garnet Chile, $1.25@1.35; old Oregon Burbanks, $1.50@1.75.

BEESWAX—Per lb, 32c.

HONEY—New Comb, per lb, White, 14c; Light Amber, 13½c; Extracted Water White, 6½c; Light Amber, 6c; Dark Amber, nominal.

Dried Fruits, Nuts, Etc.

DRIED FRUITS.—Prices for carload lots, f. o. b. at Calfornia common shipping points, in bags, for 1902 crop, are, per lb., as follows:

Apricots—Royal, 6½@8½c; Moorparks, choice, 9c.

Peaches—4¼@6½c; peeled, in boxes, nominal.

Pears—4¾@9½c.

Prunes—Four sizes, 60s to 100s, 2⅝@3c, with ½@1c premium for large sizes.

Nectarines—Whites, 4@5½c.

Figs—White, 5½@6c; Black, 5c.

NUTS—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1902 crop: Loose Muscatels, 50-lb boxes, per lb., 2-crown, 5½c; 3-crown, 5¾c; 4-crown, 6c; Seedless, loose Muscatels, 6c; London Layers, 20-lb boxes, per box, 2-crown, $1.40; 3-crown, $1.50; fancy clusters, 4-crown, $2; Dehesa, 5-crown, $2.50; Imperials, 6-crown, $3. These prices are subject to change without notice. Seeded, f. o. b. at Fresno, per lb.: Fancy, 16 oz., 7¾c; 12 oz., 6¼c; bulk, 7½c; choice, 16 oz., 7½c; 12 oz., 6c; bulk 7¼c.

BEESWAX—Per lb., 28c.

HONEY—Comb, per lb., nominal; Extracted Water White, 7c; Light Amber, 6½c; Dark Amber, 5c.

Live Stock.

Beef cattle are slightly under last week, though quotations remain same. Top prices are not receivd. Hogs are the reverse with increased quotations.

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 7@7½c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb, 5@5½c, gross weight; heavy, 4½@4¾c gross weight.

SHEEP—Per lb: Fat wethers, No. 1, 4@4¼c, gross weight; Ewes, No. 1, 3¾@4c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb, live weight.

HOGS—Per lb: Hard grain fed, weighing alive 140 lbs and over, 6¼@6½c; weighing under 140 lbs, 6@6¼c; weighing 260 to 350 lbs, 5½@6c; rough heavy, 5½@6c.

Hay and Feed Stuffs.

HAY—Prices on new hay, per ton: Wheat, $10@12.50; Wheat and Oat, $10@12; Oat, 8@11.50; Barley, $8@11; Clover, $8@10; Alfalfa, $8.50@10.50.

STRAW—Good to choice, per bale, 42½@55c.

FEED CORN MEAL—Choice grades, per ton, $27.50@28.50.

GROUND BARLEY—Per ton, $21.50@22.50.

MIDDLINGS—Per ton, $27.50@28.50.

BRAN—Per ton, $24.50@25.50.

CRACKED CORN—Choice quality, per ton, $28.50@29.50.

RICE MEAL—Mill price, $18 per ton.

BEANS AND SEEDS.

There are moderate sales in some descriptions of Beans, but, taken as a whole, the market is quiet and devoid of features with holders showing no inclination to force sales. Some slight fluctuations are noted in values for a few descriptions, but are regarded with little importance. Mustard seed is slightly steadier.

BEANS—Prices per ctl: Large Whites, $3@3.15; small, do, $3.15@3.30; Pea, $3.25@3.50; Lima, $3.50@3.65; Red, $2.90@3; Pink, $3@3.15; Bayo, $3.65@3.75; Blackeyes, $2.75@3; Red Kidneys, nominal.

Hops.

The prices for new crop are 18 @20c per lb, according to quality.

MARKET NOTES.

The grain crop is coming into market and being stored in warehouses.

Sweet potatoes will be a heavy yield in Southern California this year.

The walnut crop will be comparatively light as compared with last year. Some growers assert that the shipments out will be not over half.

The canneries are now busy putting up berries and apricots. From $15 to $20 per ton is the ruling price for apricots delivered to canneries.

A New York eastern agent for California fruit firms is quoted as saying that California will ship from seventeen to nineteen hundred carloads of green deciduous fruit this year.

Canneries over the state are reported as buying very freely of fruit, and the pack will be a record breaker.

The Stockton water front now exhibits a lively scene with the newly arriving grains from the San Joaquin valley.

Grapes about Cloverdale show some light bunches.

The Commercial Museum forwards the following from U. S. Consul James Johnston at Palermo, Italy: The present condition and prospect of the summer lemon crop is good in quality but scarce in quantity. They compare favorably with those of last year and are of the usual quality, but the quantity is about one-third less than that of last year.

Prunes are looking up. The Journal of Commerce recently said.

There is noted on the spot a marked firmness 40-50s and 50-60s prunes. Supplies are believed to be in close compass, and on the first size some business is said to have been done at 7c in 25-lb boxes Santa Clara stock. So far as can be learned, there are no offerings of 50-60s in Santa Claras under 5½c and some Visalia fruit is available at 5⅝c. On the smaller sizes the market shows a hardening tendency. Business for export account is reported. Discussing the situation today, a prominent dealer said: "The position is good and I believe this market will be looking for supplies of the larger sizes before the middle of July. The market at the moment is not ready for futures, and the few prices made have attracted only a small buying interest."

Eastern Markets.

Grain and Produce.

CHICAGO, July 1.—The sentiment in the wheat pit was generally bearish, and with more rains reported throughout the Northwest and the harvesting weather in the Southwest, there was considerable selling pressure throughout the entire day. Opening prices were easier on lower cables and better weather conditions, September being a shade higher to ⅛ to lower at 76¼@76⅜. Fair buying by the commission houses, together with the advance in corn caused a firmer feeling early in the day, and the price advanced gradually to 76½, but later reacted again on a less urgent demand. The weakness at St. Louis, due partly to the arrival there of several cars of new wheat, was a bear factor late in the day. After selling at 75½, September closed ¾ lower, 75½@75⅝. Corn was strong a large part of the session, due to the buying of some local bulls supporting the market, but fine weather and the weakness of wheat were influences that overbalanced all else, and weakness prevailed late in the day. September

closed ⅛c lower, at 50⅛. Oats were influenced mainly by the situation in corn, but the general sentiment was bearish. September closed ¼ lower, at 33¾. Provisions opened easier on fair receipts of hogs, but buying by local and outside houses caused a rally, and the market was quite active at times. September pork closed 15c higher, at 15.27½; September lard was unchanged at 8.50, while September ribs were 2½@5c lower at 6.70.

Cash quotations were as follows: Flour was steady; No. 2 spring wheat, 78; No. 3, 74@77; No. 2 red, 76½@78: No. 2 corn, 50½ @50¾; No. 2 yellow, 50@50¾; No. 2 oats, 39⅛; No. 3 white, 38½@39¾; No. 2 rye, 30½; good feeding barley, 43@45; fair to choice malting, 49@52; No. 1 flax seed, 99; No. 1 Northwestern, 1.01.

Grain Movements.

$5.75@$5.85. Sheep.	Receipts,	5000;
Flour, barrels	25,900	18,200
Wheat, bushels	58,700	30,600
Corn, "	616,300	194,700
Oats, "	753,400	222,100
Rye, "	14,400	......
Barley "	78,100	4,000

On the Produce Exchance today the butter market was steady; creamery, 16@20; dairy, 15@18; eggs steady at mark, cases included, 12½@14; cheese steady, 10½@11½.

Chicago Live Stock.

CHICAGO, JUNE 1.—Cattle: Receipts 20,000 including 2000 Texans; market slow and lower; good to prime steers, 4.90@5.50; poor to medium, 4.25@4.90; stockers and feeders, 2.75@4.70; cows, 1.60@4.40; heifers, 2.50@4.75; canners, 1.60@2.80; bulls, 2.50@4.25; calves, 1.50@4.25; Texas fed steers, 3.50@4.50. Hogs: Receipts today, 22,000; tomorrow, 25,000; left over, 3500; mixed and butchers, 5.70@5.90; good to choice heavy, 5.80@5.85; rough heavy, 5.00@5.75; light, 5.80@6.05; bulk of sales, $5.75@$8.85. Sheep: Receipts, 5000 sheep and lambs slow; good to choice wethers, 3.75@4.25; fair to choice mixed, 3.00@3.75; western sheep, 3.50@4.15; native lambs, 4.00 @4.65; western lambs, 4.00@4.50.

California Dried Fruits.

NEW YORK, July 1.—The market for evaporated apples continues quiet, and shows little change from the general conditions recently noted. common, 4@5; prime, 5½; choice, 6; fancy, 6½@7½. Spot prunes continue to attract a fair jobbing demand at prices ranging from 3 to 7 for all grades. Apricots are firm at 7¾@8½ for choice and 10@12½ for fancy. Peaches are firm, with choice at 7@7½ and fancy at 8@10½.

NEW YORK GENERAL MARKET.

NEW YORK, July 1.—Wheat: Spot easy; options closed ⅜ to ⅞c net lower. July closed 83½; September closed 80⅛; December, 80¼. Hops, dull. Hides, steady. Wool, firm.

CITRUS MARKETS

ORANGE MARKETS.

The eastern auctions the past week have, as anticipated, brought very satisfactory prices for all varieties of oranges in fair condition and in most cases are showing a steady front, but stocks in sight for the various points have not diminished and the average of last week's shipments promise heavy supplies for a dull after holiday market.

Trading in the west has been fairly active at good prices in most cases, St. Louis and Buffalo being exceptions. Recent shipments are beginning to show greater weakness, and seedlings sweets, etc., now going out, seem in some cases, lifeless and with no carrying qualities. Even Valencias have in some cases arrived in the markets showing quite a heavy percentage of decay. Showing that from some sections shipments of this variety must go out promptly. What few cars of these have sold in auction markets have brought quite satisfactory prices and if we ever get through with shipping seedlings sweets and navels the markets should take properly distributed shipments of Valencias at quite satisfactory prices.

* * *

LEMONS.

The lemon market has continued in a ver, unsatisfactory condition with some improvement to be noted under more fa ble weather conditions, but a general "hot spell" is needed to help out the lemon people and no one can say when this is coming. The cool weather has undoubtedly been of great benefit to the orange market.

EASTERN AUCTIONS.

BOSTON, JUNE 24.

Market steady.

C. C. A., Riverside, Ruby navels, $3.20.

O. K. Fr. Ex., Quail navels, 5 per cent decay, $2.95.

S. B. Fr. Ex., Arrowhead sweets, 5 per cent decay, $3. Carrier sweets, 10 per cent decay, $2.65.

Arlington H. Fr. Co., Squirrel lemons, 10 per cent decay, $1.70.

Palm Tree lemons, 15 per cent decay, $1.15.

A. C. G. Fr. Ex., Pointer navels, 10 per cent decay, $2.05.

C. C. U., Whittier, Rancho Yellow lemons, 15 per cent decay, $1.25. Rancho Green lemons, 15 per cent decay, $1.35.

NEW YORK, JUNE 24.

The Prune in California

BY JOHN ISAAC, SACRAMENTO

The California prune from its first introduction has held a foremost place among the fruit products and exports of the state. It grew rapidly in popularity and for some years was enormously profitable, but of late years the output has increased so rapidly that the market has become glutted and it has approached very close to, if, indeed, it has not sometimes crossed the line, between profit and loss.

WHEN INTRODUCED.

It is to Louis Pellier, a Frenchman and a "'49'er", that California is indebted for what is now known as the California French prune, or Petit prune d'Agen. This was in 1856, when Pellier returned to France and secured a stock of French fruits and vines, among them the one that was to add so largely to the wealth and prosperity of his adopted state. It was nearly 20 years, however, before the importance of his importation began to be realized, and at that time the prune fruit entered the field as a commercial product and since then has continued to grow in importance until we are now producing over 150,000,000 pounds annually, and in a good season the output would reach very much beyond these figures.

FAVORITE CONDITIONS.

With respect to soil, the prune will thrive on a much wider range than either the apricot or the peach. It will grow well on heavy or light soil and thrives beside the peach and apricot or the apple and pear. In fact, wherever the greengage plum will grow, the prune will do well. It will stand severe winters, and zero weather does not seriously affect it. Its favorite conditions, however, are a warm, generous soil and a temperate climate. California's superiority for prune-growing is found in her advantages of soil and climate, the former giving a fruit excellent in saccharine constituents and the latter facilities for economical curing that no other state possesses.

The prune, unlike many other varieties of fruit, is a faithful bearer; it does not take a season's rest, but can be relied upon to yield each year. Of course, there may be contingencies, as a late frost, or other unforseen circumstances to cause a shortage, but aside from these the prune will give annual crops.

KIND OF ROOT.

One of the chief matters to be considered in planting a prune orchard is the soil, for while the prune adapts itself to any soil, the stock upon which it grows may not. Uuon a light, sandy soil, well drained, not too moist, peach stock should be used. Upon the heavier lands, clayey and damp, the wild plum stock—Myrobolan—should be selected. Upon light soil, with a rocky subsoil, almond stock is the favorite. On no account should apricot stocks be used, as the prune and apricot will not make good connection, and the unfortunate planter of such is liable to find, when his trees have nearly got their growth and have heavy tops, his orchard some morning lying prone on the ground with only broken stumps where the trees stood.

VARIETIES.

There are a number of varieties of the prune, in fact, all plums are prunes, the fruit we commonly designate as the prune being simply a plum that possesses extra drying qualities, firmness of flesh, drying readily without fermenting at the pit. The favorite of all varieties grown in California is the French prune , the Petit prune d'Agen, or the California prune, as it is variously called. In fact, so largely does this preponderate that other varieties can hardly be considered in its connection. Of other varieties which are grown here, the Robe de Sergent, silver prune, Hungarian and German prunes are strongly recommended and do well.

PLANTING AND PRUNING.

In planting, the trees should be set not closer than eighteen feet. Twenty feet is better and is the favorite distance, but some of the older growers ecommend twenty-four feet. On very strong soil the greater distance would be the better, as there is danger that the mature trees will interlace their limbs and render picking and cultivating difficult.

The prune is a rapid grower and a prolific bearer. The young orchard, if properly cared for, will yield some returns when three years old, a profit the fourth year and increase its output until at seven or eight years it will be in full bearing. A five-year old orchard will yield from fifty to sixty pounds to the tree this will be doubled the sixth year.

The work of shaping and training the young tree should be completed by the time it is four years old. In this the judgment of the grower must again be exercised. There are two general methods of pruning, the high and the low, and each has its advocates. It is urged in favor of high training that it is easier to plow and cultivate the orchard, the work all being done by horses, whereas in low pruning much has to be done by hand. In favor of low pruning it is urged that the trees shade themselves in their own foliage, are not liable to sunburn, and their fruit is easier harvested. Low pruning is the best, but high or low, the grower must begin the work of training his trees the first year, in fact from the time of planting. In low pruning, when planted cut them back to about eighteen inches and shade them on the south side with a clapboard. Three or four buds may be allowed to grow at the top and the terminal buds of those below should be pinched back. This will cause them to put out leaves and shade the stalk the first season. The second year these must all be removed and the permanent branches cut back to about a foot in length the third year cut the new growth back to about two feet. In pruning, buds should be selected on the upper side of the limbs, these having greater weight bearing power than those on the under side. The grower must have in view the form of the tree he desires from the time it is planted and form it into this shape each year until it has attained its growth. After the fourth year the only pruning required will be the removal of surplus twigs, cross limbs and the unfruitful wood. The season for pruning is as soon as the sap stops flowing, and no danger is to be apprehended from "bleeding."

GATHERING THE FRUIT.

The growing of prunes is the least important part of the work, their preparation for market forming the bulk of the actual work and demanding the greater skill and judgment.

When the fruit passes from light reddish to purple and begins to wither on the tree, it is ready to gather. It should be thoroughly ripe when picked or it will lack the rich flavor which makes the prune valuable. Picking the prune is one of the most particular jobs the grower has and many of our leading prune growers pick their orchards over several times, taking only the thoroughly ripe fruit until the last picking, when they gather all that is left on the trees. Some growers allow the fruit to fall on the ground and gather it, others spread a sheet under the trees and shake them gently to cause the ripe fruit to fall. The sheet is then taken by the corners and the fruit turned into boxes and loaded on a wagon.

PREPARING FOR MARKET.

The drying process comes next. The fruit is first graded, being run through a machine gauged to the desired sizes. There are different machines made for this work, some of wire screens, with meshes of different sizes, others with rollers set at an incline and at an angle to each other, permitting fruit of the desired size to pass through. As good a grader as any is a riddle about twelve feet in length, with different sizes of wire screen on it. The first screen chould be of small mesh to allow the leaves, stems and dirt only to pass through, the others should be graded to the size of the fruit. This machine should be hung with a rope at each corner and at a slight incline. The fruit is put in at the top and a gentle oscillating motion causes it to fall through the meshes into boxes placed to receive it. The smallest fruit finds its way through the first screen, the larger passing on down until at the end of the grader the largest fruit is left.

The prune has a tough skin and if left in its natural state would not dry readily. To overcome this it must be dipped in boiling lye. This thins the skin, causes it to crack, and permits the moisture to evaporate. The usual

(Continued on page 21)

HUNDREDS OF TONS OF PRUNES.—Prune drying yard at Campbell, near San Jose, California. Doubtless one of the largest spreads of prunes ever made. This cut is made for the Cultivator from a five-foot panorama photograph, now in the Peck Tourist Bureau office in this city.

Circulation this issue 8,000

Col. Steadman, Editor of the Cultivator, is taking an outing and attending to business interests at his stock ranch near Council Bluffs, Iowa.

The Wine Association of Central California does not intend to manufacture as much wine this as last year. One reason is the inability to secure sufficient cooperage.

Prof. Cook in his reply to a correspondent this week, referred to bees which injure drying fruit, and spoke of the great good these same insects also do, in aiding us to secure large fruit crops. While this must be admitted to be true, we must also confess that it is very exasperating for the fruit drier, who at much expense prepares and places on trays, valuable fruit, to see the bees carry away a large part of it. We have no remedy to suggest for it unless it be that the owners of the bees should during the fruit drying season provide other good pasturage for their bees. Meantime let the fruit growers and owners of bees be neighborly and "give and take."

FAIR AND FAIRS.

The coming State Fair at Sacramento promises to be a big success—an Agricultural fair. The coming Los Angeles "Agricultural fair promises to be a crack-a-jack hoss race with pool selling and things. The "farmers" attending will wear plug hats, paste diamonds, a cigar and possibly a cane and some other garments. This prosperity will be far more apparent than that of the farmer who goes to an ordinary "pumpkin" show where fruits, flowers, grain and other products of the soil, with thoroughbred stock and farm appliances are gathered for an instructive display of the resources of the country.

As to whether the State Fair will be true to the promises remains to be seen. Certainly present indications are good. A little later it can be determined as to whether these are only promises and the political grab-bag-boss-race combination will there prevail or an honest fair be given us.

GETTING FERTILIZER FACTS.

Frank L. Palmer, of Pomona, who is requested to lead in the discussion of the subject of fertilization at the Seaside Institute to be held at Long Beach July 27 to Aug. 1, is going after the subject with his usual thoroughness . He has prepared and mailed to many of our best orchardists a circular with questions covering almost the entire range of fertilizing. To give a better idea we quote the first of the circular:

My dear Sir: Prof. Cook has asked me to lead a discussion on the subject of fertilization at a Seaside Institute he has planned to hold at Long Beach July 27th to August 1st. I know of no way in which this discussion can be made more profitable and interesting than by presenting the opinions of a large number of our representative orange growers as to some problems relating to fertilizing, upon which prevailing ideas are supposed to differ. With this thought in view I have prepared the following list of questions, and if you will be so good as to take the trouble to answer them it will be very much appreciated not only by myself but also, I am sure, by all who attend the Institute, or who read the reports of the proceedings. I hope to have replies from forty of fifty different persons who have given the subject some thought, and if I receive a sufficient number of responses I will undertake to tabulate them, and I feel confident that these responses will form a basis for some conclusions that will prove very interesting and also valuable.

Have you known of stable manure being used exclusively on the same orange or lemon trees for five consecutive year, or more, and what was the result? Did the quality of the fruit deteriorate under this treatment? What was the nature of the soil? Have you known of the same character of commercial fertilizer (complete fertilizer) being used exclusively on the same orange or lemon trees for five consecutive years, or more, and what was the result? Did the quantity of fruit increase satisfactorily from year to year? Did the quality deteriorate?

And so on for thirty or forty questions. It should gather together a mass of information of value to orchardists.

The committee have secured a fine camping ground on the bluff which will be free to all who come to attend the Institute. This will bring the expense within the reach of all. As the Institute is under the auspices of the University, it is, of course, free to all.

THE NEW YEAR BOOK.

This office is in receipt of the Year Book of the Department of Agriculture for 1902. It is a book of over 900 pages, in two parts. First there is reports from the various heads of divisions and is more or less of value as business and executive matter of the department.

Part two contains reports from field workers and articles of great value to the farmers of the country. These articles are made of greater value by a large number of illustrations, some colored, and many maps and diagrams.

There have been a half a million copies issued and the books are for free distribution to applicants for them. Write to your Congressman or Senator for the book. It does not contain so much of direct interest to farmers on the Pacific coast as some past numbers have, yet it is of great value to all.

Mr. Day of Pasadena informs the Cultivator that the black scale are hatching later and more nearly all at the same time this year than usually. Due largely, doubtless, to the wet and cold spring holding back the early hatch. The uniform hatch will facilitate and make more effective the work of spraying and fumigating.

This work will begin within the next few weeks and continue for some months. Mr. Day says that the grower may defer as long as possible if he will only watch his scale and use the remedy before the shell gets too old and hard to be reached. This stage will soon be reached after the scale begins to take on black or blue black color and get very shiny. By watching in this way and holding over as long as possible more of the young will be out of the shell and the destruction more complete.

A FUTURE FOR OUR FRUIT INDUSTRY.

Every once and a while, especially when the demand lessens, and prices are poor, there goes up a great outcry about the over-production of fruit, and we are urged to stop planting more trees and increasing the yield. The trouble is we always want the other fellow to stop and dig up his trees to give us a better whack at the markets, and the other fellow doesn't see it. There is no use in advocating limited production. There is only one thing that will limit production and that is the market itself, and while this is even tolerably good, or while it holds out a hope of being better, the man who has land that is not profitable for other crops, or who thinks he can do better in fruit, will go on planting, and he will always regard the advice given him by the man already in the business as being inspired by a selfish motive, and the desire for keeping a good thing all for himself. And, really, we see no reason why, because there may be an occasional poor season, we should put a period to fruit growing.

The population of the United States is rapidly increasing, meat and meat products are each year becoming scarcer and dearer, and fruit is becoming cheaper and more plentiful. It is fast ceasing to be an article of luxury and is becoming a necessary article of diet. Improved methods of preserving, canning and drying place it before us the whole year round, and enable us to send it to the furthermost corners of the earth. Rapid transportation and a widening market enable us to present it in its fresh state to a very large population. We are not confined to a local or even a national market, but have the world in which to dispose of our products. Of course, we do not have the only fruit producing sections, but there is room for us among the rest, and room at the top, and while the days of fancy prices and enormous profits are past, there will ever be a demand for all the fruit California can produce, and at living prices.

We need some reformation in the matter of transportation and marketing that producer and consumer may be brought nearer together, but this is coming and we should never advise a man to cut down his orchard because prices were not good for one or two seasons.

A NEW HORTICULTURAL COMMISSION.

Sonoma county, which has long refused or neglected to appoint a Horticultural Commission, has at last awakened to the need of it and the supervisors have appointed Allen R. Galloway, of Healdsburg; O. E. Bremner, of Bennett Valley, and James H. Moran, of Sebastopol as commissioners. The supervisors of Sonoma have stood out against this appointment for a long time, and left the one great industry of their county exposed to all the danger of outside infestation. As a matter of protection to the state at large the State Horticultural Quarantine officer has, at great trouble and expense, looked out for stuff coming into Sonoma county from outside the state, but until the present time all the efforts on the part of the fruit growers of Sonoma to have their industry protected has been unavailing. It seems that at last the pressure has been too great, and the supervisors have been compelled to do their duty and have appointed a good commission. As Sonoma no longer leaves the open door for the introduction of pests, the state at large is to be congratulated, and as she has an efficient board to attend to her horticultural interests the county is equally open to congratulations.

The readers of the Cultivator should take particular notice of Prof. Cook's articles running at the present time in the Cultivator. If Prof. Cook can make anything interesting, and he has a reputation on that line, it is the subject of entomology. At present he is running "A B C of Insects," and it is not only interesting reading for the farmer with crops which may be destroyed or saved by insects, but it is especially instructive for the young people of the farm who may wish to know more about the life about them on every hand. Call the attention of the boys and girls to these articles.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

MADE THEM "ABOUT FACE."

Last week some argument was presented to show that certain lines of economics must be made to prevail in the growing, preparing and marketing citrus fruits to make the industry profitable. As is usual with these articles an attempt was made to inbue them with the spirit of co-operation. In this all will agree that co-operation is absolutely necessary in the selling of fruit, for here is where the grower usually makes fatal mistake. In order to make impressive the conditions that prevail, one has only to keep posted upon the doings of the commission men and brokers at the eastern end of the line. There the struggle is continual between the growers-shippers of all the fruit products of the country and the professional fruit merchants. Some weeks ago a committee of the Norfolk association of shippers visited New York and other large cities to see if the burdensome commission charges could not be ameliorated and other abuses of the system rectified. This committee ran against the National League of Commission Merchants in New York with fatal results to the committee's "pretensions." Under the head "An object lesson as to the League's value," the Fruitman's Guide rubs it into the Norfolk men in great shape. "Here in New York," the Guide boastfully exclaims, "the shippers were right about faced with a prompt and decisive 'No.'" "Who can question the advantage of belonging to the League in the face of such an episode as that of the visit of the Norfolk shippers. 'All for one and one for all' would be the motto of the merchants in each branch of the League. With every good house included in the League's ranks, the rate of commission would become as fixed as the Pole Star, unsusceptible of drop or change, invincible against cut or shave." From the above it requires little imagination—only a retrospective view ten years back would suffice—to indicate the position of helplessness the citrus fruit growers would be in now were they not organized and in possession of their own selling agencies. And yet there are a few misdirected growers in California who by their acts are inviting a return to the vassalage of the commission system.

Another phase of the situation is discussed in The Fruit Trade Journal of New York, once the organ of the League, but not now for that profitable mantle has fallen upon the Fruitman's Guide. Sometimes the trade really buys its produce from the farmer. Under the head "Combination among merchants advised" the Journal presents an awful case where twenty-one brokers' buyers appeared at one Southern potato shipping point to buy potatoes. "What a picnic for the grower who is well organized and whom this wild competitive buying places in a position to dictate almost any price he sees fit," says the Journal. This practice of paying what produce is worth should be stopped even if the militia has to be called out. "Are the commission merchants of St. Louis, who have given the strenuous toil of mind and muscle of the best years of their lives to establishing great business enterprises, some of them of international reputation going to lie down in the dust and allow the wheels of the chariot of progress to crush them out of existence?" almost tearfully exclaims the Journal. "To attain the coveted goal a decade or two ago was mere child's play in comparison" (with running up against the growers' organizations of the present day). "Then with the nerve and the money a man might have shut his eyes and plunged and came out a winner ninety-nine times out of a hundred. Today if a merchant attempts to get a corner on apples, onions, cabbage or whatever you will, he finds when he closes the deal that he would have been money ahead if he had stayed out" is another frank expression from the Journal. But here is the gist of it all in a closing plea for organization among the commission.

men: "The organization of growers' associations is of almost daily occurrence from the Atlantic to the Pacific and from Canada to the Gulf. These associations are undoubtedly a good thing for the grower when wisely managed; but they become a menace to the jobber when, in the process of evolution, they begin to affect the distribution of their products by establishing their own agencies in the various markets. Such a condition is not problematical; it is already a reality."

Growers will no doubt cover themselves with sack cloth and ashes and join in the general lamentation when they learn that their co-operation has prevented 99 per cent. of the commission merchants of the East from getting rich by investing but a few dollars in rentals and stationery. No one of the middle west will dispute the fact of the commission men of St. Louis having "reputations" in the halcyon days from 1870 to—this date if you wish, or that they had the "nerve" to win at the expense of the grower. Now they and their brokers propose to organize for the purpose of getting a cinch upon the business and bringing back in a measure the good old days of yore which were first disturbed by the co-operators of Southern California in establishing their own selling system. But, oh, the agony of it all, for we are told as a parting shot that unless the fruit and produce merchants realize that they must meet combination with combination, even the strongest must eventually become discouraged and either withdraw from the unequal struggle or fall by the wayside. "Beg pardon, butI shall have to leave you," said the fly which had been sitting upon the horn of an ox. "Your servant," said the ox, "but I did not know you were there."

What is the "trade evolution" these fellows are so much afraid of? And this "Chariot of Progress?" They are merely the effort to remove all intermediaries from the fruit trade. To eliminate the elements which have forced irresponsible control of the fruit selling business for many decades. Trade evolution and chariot of progress are good terms, but if the commission men think their own consolidation would be accepted as an assistance in this progress they mistake the calibre of the modern American farmer. In the attempt to market the corn crop of the Mississippi bottom we have seen the wheels of progress filled from hub to felloe with crabgrass an black mud. This is the way the commission system would assist the chariot of progress by attaching itself again in Southern California. A sharp hatchet and a hand spike were required to release the wheels in the corn field. Co-operation and independent marketing are equally effective in removing the commission incubus. They have already released the wheels these ten years back and the progressive citrus grower will not allow the same old obstructionists to get a new hold in Southern California.

PEACH ROOT BORER.

Charles I. Hemphill, of San Jose, sends a communication regarding the peach root borer and a remedy which he has used for several years and now recommends as thoroughly efficacious.

It appears from this letter that his remedy is thoroughly effective and while some trouble and expense for the first application, the end justifies the means. Regarding this remedy Mr. Hemphill says:

"About six years ago I discovered a remedy that not only destroys the peach root borer, but keeps them out and also enables the tree to grow new bark and in three or four years to be as good as though a borer had never been in it."

The writer then adds that originally he began an investigation expecting to procure a patent on the process. Later, the fruit growers around San Jose offered to award $1000 for an effective remedy, he decided to give the remedy freely to the public.

Mr. Hemphill now invites any one interested to call at his place near San Jose and inspect results. He prefers callers to come between five and six o'clock on week days.

Regarding the borer and the method of handling it, Mr. Hemphill says:

"The borer passes into the cocoon and fly state and lays its eggs from the middle of March to the latter part of September, a period of about six months. The great difficulty in destroying the pest has been due to the long laying season.

For any one to hope to get a thorough mastery of the "borers" by digging he must dig every day in the year.

For the most effective work the trunk of the tree and the roots for a foot or more below the surface must be freed of all borers. Clear away dirt, with knife and wire, or, Neff's borer tool gives best results. kill all borers which may be found. Use the tool so as to cut out the outer bark over the run, leaving a groove just as long as the borer runs. Fortunately the borers work up and down. If they went around the tree it would soon be girdled.

Remove all dust and dirt from the surface, apply the wash given below, let stand three days and then evidence of other borers will be seen. Kill them and in three days call again. Repeat the killing and the whitewashing. When no longer evidence of the pest remains fill in with dirt, being careful not to crack off the wash. There may still be small worms left which indicate their presence by small specks of sawdust. Kill these.

In December open up the dirt and more half grown gorers may be found and killed. Whitewash again. In March repeat, if any are alive, which is hardly probable with the past thorough work. But whitewash again for protection the coming season.

This is hard work, but it is thorough.

The wash consists of three gallons of slacked lime, one-half pint of coal tar, and one-and a half pints of good loam soil or clay. Mix thoroughly, using water, until it is of the consistency of paint. If too thick to apply readily with whitewash brush, thin with water from time to time. Be sure there are no cracks in the wash. If there are the borers get entrance, all must be done over. Wash the tree above the ground at least a foot and have plenty at bottom of trench about tree.

In closing, Mr. Hemphill urges all to follow his plan and the orchards will soon be absolutely free of the pest.

In connection with the above it may be interesting to note that last week's San Jose Mercury speaks of a new remedy. It is a gas from a chemical called Naphine. Its discoverer, Julius H. Bien, a graduate of the Department of the Tulaine Medical University of New Orleans, now resides in San Jose, and is testing the remedy on peach root borers and other insects. If it proves a success, its application is far simpler and would prove much cheaper. The Mercury says:

"Besides being a remedy for troublesome insects of all kinds it is destructive to flies and is a good disinfectant for all kinds of diseases, according to the discoverer.

If the results of the experiments now being tried are satisfactory to Mr. Bien he will erect a big plant in this city for the manufacture of naphine before next year and will make San Jose his permanent place of business."

George H. Marsh of the Pomona Ladder Co., has moved his factory to new and larger quarters and now has a full block of land, with office on corner of Sixth and Cypress streets, Pomona. The "Tripod" is proving a winner in the fruit picking sections and has such strong points that its sale constantly increases. The use of the single support, instead of two, has proved a good feature in picking, especially in dense trees, when the single leg may be readily adjusted. Unlike other single leg, or three leg, rather, ladders, the head of this ladder is very rigid and gives a feeling of safety to the fruit picker. The bolt holding each step and double steel brace are factors of strength which add to its permanence. But the Tripod isn't Mr. Marsh's only pride, for his extension step ladder is a crack-a-jack and useful in so many ways that it is almost indispensable about the house, barn or shop. These ladders are used in some of the largest orchards in Southern California.

He (gazing at the stars): "I wonder which are the evil stars?" She: "The ones that wink."—New York Herald.

Coast News and Notes

By R. A. ..gue, 1045 Regent St., Alameda

The cherry crop is about over.

Hops are doing well in the state but will be a light crop.

The hay crop is below the average north of the Tehachapi.

The Napa Woolen Mills are being removed to Coos Bay, Oregon.

New grapes are now found in the San Francisco market at 50 cents per basket.

It is said that the Riverside orange crop will exceed the former estimate of 4000 cars.

An army of caterpillars are ravaging the country in the vicinity of Walla Walla, Washington.

The striking mill workers of Spokane have raised $250,000 and will start a co-operative mill.

The Alvarado sugar factory announces that it will contract for beets for 1904 at $5.00 per ton, delivered.

There is now on exhibition at the Oakland Board of Trade rooms a Beauty rose that is 6½ inches in diameter.

The prospects for a heavy raisin and peach crop in the Fresno section are good. Prunes and apricots short.

The Oxnard sugar factory is now in full operation. The beet crop is the largest ever raised in Ventura county.

Strawberries are now said to be a remedy for rheumatism and gout, because of the salicylic acid contained in them.

Lou Dillon, the Santa Rosa mare, broke all records for a mile at Cleveland, Ohio, June 30. She went it in 2:04¾.

About 300,000 acres of land have been added to the forest reserve of the Susanville district of Northern California.

California is the first state to secure a day at the St. Louis Exposition. Sept. 9, 1904, is to be California day at the great fair.

The State University began July 1st to prepare Farmers' Institute work. The last Legislature appropriated $12,000 for that purpose.

A movement is said to be on foot to bring about a combination of all the woolen mills on the Pacific coast. John Martin is the promoter.

Dr. Andrew Sayous, a scientist of the University of Paris, is making a tour of the state, carefully studying our agricultural industries.

Allen G. Fraser of San Francisco has leased Santa Cruz island, 28 miles from Santa Barbara, and will make a health and pleasure resort of it.

Seven carloads of prunes were recently shipped by M. L. McDonald of Santa Rosa to France. The fruit was packed in 12* and 25-pound boxes.

An English capitalist has written Secretary Stearns of the Oakland Board of Trade saying he desires to purchase a large California vineyard.

The Haywards fruit packing establishment of Hunt Brothers will have a short campaign owing to shortness of the cherry crop. They now employ 200 girls.

E. L. Hasler & Co. is the new fruit dealing firm that grew up out of the wreck of the Porter Brothers Company. They have succeeded to the Chicago business.

Both the apricots and peaches in the Santa Clara valley, just now beginning ti ripen, are dropping from the trees and the orchardists are seriously troubled in consequence.

At the last weekly sale of the Santa Rosa Poultry Association, sixty cars of eggs were sold at 18½ cents per dozen. These weekly sales are assuming considerable importance.

H. Olmstead of Santa Cruz, has brought out a new berry which he calls the "Black Loganberry." It is a cross of the Loganberry with the Black Kittatinny. The new fruit is vary large and very fine.

Professors Woodworth and Clarke again report progress in their efforts to destroy codling moth in the apple orchards near Watsonville. There is still some danger of a second brood which, if unchecked, may enter the fruit.

There are twenty-six large ships, fifteen barges, and two steamers idle in the San Francisco bay awaiting to be chartered to carry California grain arboad. They are mainly English vessels.

O. D. Freeman of the Santa Rosa Poultry Association shipped a few days ago ten White Minorcas and White Leghorn fowls to Santa Maria, Santa Barbara county, for breeding stock.

The San Francisco Harbor Commissioners are taking steps now to provide space for the free market provided for by the last Legislature. Why they waited till after the fruit season is half over they know best.

Consul Joseph Britain at Kiel, Germany, reports to the state department that California prunes and apricots are supplanting the products of Italy and France because California fruits are cheaper and its flesh brighter and more solid.

A dispatch from Germany says the Germans like California dried fruits. J. A. Filcher laid the foundation for that. When at the Hamburg Exposition he set up a cooking range and stewed California fruits and fed the German on them.

I. B. Morris of Forestville has set out sixteen acres to nursery stock. He has 16,000 cherry trees, 175,000 grape cuttings rooted for the coming year, and 30,000 apple trees. He says that apples, cherries and grapes will eventually take the lead among Sonoma county fruits.

Prof. A. P. Stover, government expert in irrigation, has begun investigations at Pomona and in Tulare county, to ascertain how alkali streaks in land may be overcome. The U. S. government has appropriated $10,000 and the state $20,000 to be expended in making the experiment.

There has been for two weeks a presistent fight made against the invading grasshoppers in Fresno county. Twenty or thirty ranches band together and like an army march against the pests fighting them with sacks and fire. The farmers seem to be winning the fight.

Many sections are already preparing fine specimens of fruit for the St. Louis Exposition. The fruit is put into a solution of formaldehyde, glycerine, filtered water and sulphurous acid, and then placed in the dark for six weeks in order that the specimens may retain their color.

The Fruit Distributing Association had on the 3d instant shipped from Sacramento thirty-nine carloads of fruit to the East. The fruit shipped was: Three-quarters of a car of cherries. 2½ cars of apricots, 11 carloads of peaches, 24¼ carloads of plums and prunes, ¼ carload pears and ¼ carload of apples.

Dr. Geo. S. Mickox, chief of the U. S. Inspector force of the bureau of animal industry, is preparing to enter upon a vigorous campaign against the sheep scale disease in Wyoming, Utah and other Western states. His remedy is to dip the sheep into a solution the ingredients of which have not been made public.

It now is charged that the great grain dealing firm of Eppinger Brothers transacted a great deal of crooked business. It is alleged that wheat was put in warehouses and money borrowed on it and then moved to another place and more money borrowed; and a story is told how clients were cheated in weights.

The Fisher-Merritt Fruit Company has just been organized at Santa Rosa. There are 500 shares of stock valued at $100 per share. Edson C. Merritt, in charge of the Santa Rosa branch, subscribes $16,000; W. L. Whitaker, $1000; W. M. Fisher, of the Napa plant, $16,000; A. Schmolz, of Napa, $1000; Senator Woodward, $16,000.

The stock raisers along the Cosumnes river are losing thousands of dollars from hog cholera. Medicine so far has done no good. Dr. McCollum says it is germ disease and advises burning the ground bare on which the swine run. The Doctor says there are twenty-one different germs that produce cholera.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

(Continued.)

In our survey of the great branch or Phylum of jointed animals, which includes insects, we have spoken of the water breathing crustacea class and the many legged Myriapods, and have also looked in upon one order, the little mites of the class Arachnida. It will not take long to complete our survey of this latter class, as the two latter orders of the class are not of special interest to the farmer. Indeed, in so far as they are of any importance, they are our friends. It will be hard to persuade many people that the spider is really a worthy member of the great animal society.

We now consider the second order of this spider class, which consists of a rather heterogeneous collection, but which, for convenience, I will group under the name Arthrogastra. These animals are well named, as all of them have jointed abdomens. Like the true spider, their body is made up of two parts, the head-thorax and the abdomen; but this latter part is always segmented, that is it is made up of rings or segments. We may know this group by the name scorpion order. It embraces not only the grandfather graybeard, or daddy-long-legs, but also the true scorpions, the whip scorpions of Florida, and the little book scorpion, often found in houses about book cases. It is much the form of the bedbug and not very different in size, but is easily detected by its great palpi, which ends in formidable pincers, which resemble greatly the great front legs of a crab or craw-fish. These do no harm, feed on insects, and so might be called our friends.

The true scorpions are very familiar in all Southern California. Some of them become quite large in this section. I have them full four inches long taken at Claremont. They also have the great palpi which ends in strong scissors-like pincers. As is well known, the abdomen is tipped with a poisonous sting, which is said to be quite virulent in its effects when used. These also feed on insects, rarely do any harm by use of their sting, and may well be considered as our friends. It is often reported that the sting of the scorpion is very serious. It is to be presumed that the danger from these animals is very much exaggerated.

The whip scorpion of Florida is so named because of long tail-like appendages attached to the tip of their abdomen. They are much like the true scorpion, except that the abdomen is as broad as the head-thorax. Although dreaded by many they are perfectly harmless and are wholly our friends.

Grandfather gray-beard is as broad as long, like our lady bird beetles, and is chiefly characterized by his enormously long legs, which of course like all the spider group are eight in number. I think these do neither good nor harm. A good place to study them is while camping in the mountains. We have pitched our tents in the canyons for the past two summers, and these daddy-long-legs would gather upon the outside of the tent by the thousand. I said they did no good. Perhaps I ought to add that they will when picked up, point to the direction where the absent cows are which we wish to find. Their legs, of course, point in all directions.

* * * *

TRUE SPIDERS.—The last order of the spider class includes the familiar spiders, which every one knows and nearly all dread. This order is known technically as Araneina. They differ from the scorpions in that their abdomen is a mere bag and not ringed at all. Indeed, their abdomen is not unlike the whole mite or tick. Their chief characteristic is the possession of spinerets at the tip of their body with which they spin their webs. These webs serve them many purposes, as a tight rope on which to climb or swing, a great net in which to rest or by aid of which to capture their prey, or may be used for weaving a den or nest where they are secure against harm, may line their nest in the ground, as is seen with the trap door spider, in which case they make a lid of the same silk, which closes their underground home in a most ingenious fashion. Again, some of them use this silk to fashion a diving bell. These are water spiders and use this diving bell to carry air down deeply into the water, for all spiders are always air breathers. As we should expect, the mouth organs and feet of the spiders are curiously modified that they may dextrously use this silk. The silken thread is composite as it passes out of many tubes as a liquid, but at once hardens into the beautiful silk which serves them in the multitudinous ways suggested above. The spiders live wholly upon insects and so are only friends to the farmer. Their webs may become unsightly, and so must be destroyed, yet when left in house or barn, they capture and destroy myriads of flies and so are not wholly to be condemned.

The spiders are often much dreaded. True, their bite is poison, but their jaws are usually so weak and the poison so light that they are wholly impotent to harm the higher animals and so are little to be feared by man. I have found, however, that the great tarantula of California, an enormously large spider, will secrete a large amount of poison and also possesses enormous jaws. I have found it the one exception to my rule, for I always show my students by careless handling that the common spiders need not be feared. There is quite common in California a little black spider with red markings upon it which is reputed to be quite a serious enemy. I have had several reports on its bite in various parts of Southern California, and in nearly all cases quite serious results attended its bite. This species is found in many parts of the world. In all places it has the same unsavory reputation. It is known to science as Laterodactus mactans. While its bite is attended with great pain, swelling and fever, it is never, I think, fatal.

* * *

SPIDER NESTS.

Mr. A. M. Seeley, Covina, one of our bright fruit inspectors sends me orange leaves containing each a circular web about the size of a nickel. Mr. Seeley asks if these have any relation to the spiders that destroy the young buds of the orange trees. Mr. Seeley will see by the article in today's Cultivator that true spiders do us no harm. They feed wholly upon insects and are therefore our friends. These round web patches on the leaves are simply the niduses or egg cases of our common spiders. Thus this is another use that the spiders have for their silk. They, sometimes, even spin a bag in which the eggs are placed and they then carry this bag around until the eggs are hatched after which the young may in some cases gather on the mother's back and are still carried by her. Spiders never do harm, as stated in this number of the Cultivator. We must remember that mites, so often injurious are not spiders though they do belong to the spider class. It is even more incorrect to call spiders insects. One of our ablest editors in his paper of last week referred to mites as insects. It would be less an error to speak of sheep and hogs as cattle, or dogs as felines. The same writer spoke of using kerosene emulsion against these mites. I think it were better to recommend the distillate spray.

* * *

DEFORMED BEES.

G. F. Ernst, Vacaville, mails me some deformed bees which he says are quite common in some of his hives. For some reason these bees have failed to develop perfectly. I have never seen anything like it before and so can give neither cause nor remedy. I doubt if the trouble continues long. give neither cause nor remedy. I

* * *

BEES AND FRUIT.

M. S. Phillips, Campbell, Cal., keeps bees. His nearest neighbor dries fruit and finds the bees quite a disturbance. He wishes to know if he can be compelled to remove the bees or can be proceeded against legally. There have been many cases of this kind in the country and in no case has the conviction of a beekeeper under like circumstances been sustained by the higher courts. Mr. Phillips should join the Beekeepers' Union and then in case of law, his rights make it clear to his neighbor that the bees are much more of an aid than an injury even to the fruit grown.

* * *

DECAY IN LOGANBERRY.

J. C. Wilday, Pacific Beach, forwards some "defective Loganberries. The vines are fine, the soil good, and the same plants have heretofore been ripening their fruit in fine condition." Mr. Wilday wonders if there is not some fault with the soil. This seems to be a case of genuine rot. All such trouble is bacterial and comes from a specific germ. As well say oats or grass spring up from the soil because the soil is faulty as to say that rot comes from soil deficiency. If this trouble continues, Bordeaux mixture would be the remedy to try. As I have not heard of such affection before, I can but hope that the difficulty is transient. Have others of our readers had any such difficulty?

* * *

PSOCUS FLIES ONCE MORE.

H. H. Hale, Fullerton, forwards orange leaves on which are several of the almost white Psocus flies. He thinks they defoliate the trees as the leaves are falling badly. This is almost certainly a mistake. The Psocus flies are almost white, quick of movement, with prominent eyes and long antennae. They do no harm. In case leaves fall it may be caused by the red mite (red spider), or by some condition of water or soil, possibly of climate or temperature, which has enfeebled the tree.

* * *

CARBON BISULPHIDE FOR POTATO MOTH.

Mr. William Wagner, Anaheim, is troubled with the potato moth, and asks directions for the use of carbon bisulphide. As is well known, this moth works on the potato not only in the field but after the potatoes are stored. If the potatoes are placed in a close bin or box and carbon bisulphide added, the insects will certainly be killed—all that are subjected to the vapors. Mr. Wagner should send to the Agricultural Department of the University for the excellent bulletin just issued on this subject. How many of our readers really know of and appreciate the good work of our University in their valuable researches and publications regarding our insect foes? Every live farmer should write to the Department, Dr. E. W. Hilgard, Experiment Station, Berkeley, and ask that his name be put on the mailing list.

* * *

FORCING BEES INTO THE SUPERS.

C. W. Stone, Morgan Hill, California, asks for directions which will impel reluctant bees into the sections. Extracted honey sells for 6 cents per pound, while the same honey in the comb will bring often more than twice as much in the market. The novice can often succeed well in working for extracted honey, while the expert may often have indifferent success in the production of a similar grade of comb honey. The reason is largely indicated in Mr. Stone's question. It is often very difficult to induce bees to enter the sections, it is natural for bees to put the honey close above the brood; when, therefore, we put the sections in a crate, which is placed entirely above the brood nest, we force unnatural conditions, and hence the difficulty of securing active storing in this surplus honey chamber.

There are two or three things that help very much in this matter. Sections with comb and possibly partly filled with honey, left over from the previous year, will often attract the bees and accomplish our purpose. If we fill one section with unsealed brood and place this in the section crate, we are almost sure to attract the bees to storing in this surplus case. Once at work in this section and they are likely to continue in which case we can remove the brood. If we perform these last two acts, and place the surplus crate with the remaining sections full of foundation upon a hive in which a new swarm has been hived with empty brood frames or frame with foundations only, we are likely indeed to secure a full force of bees which will actively store in the surplus case. As they get to crowding the sections, we can raise this crate, add another, below and continue until we sometimes have four or five crates of sections on a single hive. By such manipulations the expert is often able to secure nearly as much comb honey as he would have of extracted. Of course in all such cases the colony must be strong at the dawn of the honey season. I always found a great deal more pleasure in working for comb honey than extracting honey, possibly because it requires much more skill to obtain the same degree of success.

Little Los Angeles Girl, reading: "Papa, what is sheep husbandry? Is it getting husbands for little girl sheep?

Any one that is interested in the Smyrna Fig business should know what variety of capri to plant. Now is the time to determine. Send 25c to cover packing and postage, to W. Herbert Samson, Corning, Cal., proprietor of Maywood Colony Nursery, and he will send you by mail four of the Capri Figs of different varieties, containing the Blastophaga. The figs contain from three to eight hundred insects.

Persons wanting larger quantities can obtain the figs for $5 per 100. Mr. Samson has made a study of this business for the past three years, and has proven that he has the best variety of Capri fig in the state.

THE PRUNE IN CALIFORNIA.

Continued from first page)

strength of this dip is one pound of concentrated lye to ten gallons of water, but this varies according to the ripeness of the fruit and the toughness of the skin. The fruit is put into wire baskets or perforated buckets each holding about half a bushel, and immersed in the boiling lye. The length of time they are immersed depends somewhat upon the fruit but sufficiently long to soften the skin, which is indicated by the surface of the fruit appearing checked. From the lye bath to the rinsing bath is the next process. This may be a stream of fresh running water or a vat of fresh water; if the latter, it must be frequently changed, in order that every vestige of lye be removed. After this the fruit is spread on the drying trays and exposed to the sun until it is sufficiently dried to keep, but not dry enough to rattle. This takes from a week to a month, dependent upon the season and the weather. From the drying ground the fruit is taken to the sweat bin, where it is piled in heaps for two or three weeks, being turned over several times and thoroughly intermixed. This process gives the prune its black, glossy appearance and also causes it to assume some of its original plumpness. After the sweating comes the finishing, which is simply the dipping of the now dried fruit in another hot bath. This time the bath is of clear boiling water to kill off whatever insect germs which may have found lodgment and to soften the skin. The fruit should be left in this until partly cooked.

THE FUTURE.

The question of a future market for our constantly increasing prune crop is at present a serious one, but it is encouraging to note that while, in the past ten years there has been a steady falling off in the importation of prunes, which is now confined almost wholly to some fancy brands, we have been steadily increasing our exports, and this largely to France and Germany, both prune producing countries. The following table may be interesting as indicating this:

QUANTITY AND VALUE OF EXPORTS OF PRUNES.

Fiscal year.	Pounds.	Value.
1897-98	15,940,791	$1,021,888
1898-99	5,615,565	380,847
1899-00	25,922,371	1,646,332
1900-01	10,021,564	589,113
1901-02	23,358,849	1,404,422

A serious shortage in the prune crop of France for the past few years accounts for the foreign movement. Whether the foreign demand will increase or decrease in the near future, cannot, of course, be told, but it is probable that, even with the occasional dull seasons, California prunes will always find a market at fair prices.

A NEW USE FOR THE FIG.

The fig is one of California's favorite fruits and is eaten fresh, dried, pickled and preserved, but it has not yet been put upon the market canned. This season, however, for the first time, the experiment is being made in this direction, at the Gridley, Butte county, cannery, which is operated by Hunt Bros. The cannery recently closed a contract with H. W. McNamee for twenty tons of Smyrna figs, which will be canned. This process contemplates the canning of the fruit with all its natural juices intact, without drying or other process than hermetical sealing. Figs are not abundant in Butte county, and it is expected that this new use for the fruit will stimulate the planting of fig trees. Only the Smyrna variety wil be used as the Adriatic variety is not considered suitable for the purpose. The management of the cannery intend also to put up plums and pears this season.

THE BUSY SEASON.

The hot weather of the past few weeks has ripened fruit with great rapidity and it is now coming in with a rush. Work in the packing houses, canneries and driers is being rushed as fast as the available help can handle the fruit. It is now that the great shortage of help is being most severely felt and there is hardly a concern in the state engaged in handling fruit that is not in need of more help.

Deciduous Fruits

By J. W. Mills, Ontario, Cal.

POTATO GROWING.

A reader of the Cultivator has suggested that we might do some good at this time if we publish something on planting and irrigating potatoes, with special reference to the fall crop. One of the points to be considered is the preparation of land from which a crop has just been removed, leaving the ground almost dust dry.

We happen to have had a little experience in that very sort of potato growing and we can at least point out where some mistakes might be avoided. As a general proposition, it does not pay to raise a crop of hay on land which is destined to be used in growing potatoes, provided the water costs over a cent an inch per hour. It will pay to keep the land well cultivated until the summer planting time comes, which is about the last of July.

On hay ground that is now dry, we advise making checks and flooding the surface about a week before planting. This should be well cultivated so as to preserve as much moisture as possible and about three days before planting the ground should be given another thorough irrigation, then plowed deeply and harrowed down. Our experience has been with irrigating in furrows but we found that where there was enough grade to allow the water to pass along rapidly, the soil would be dry a few inches below the surface. We think that flooding should be done as described so as to get a uniform amount of moisture over the entire surface. The roots of grain penerate for three or four feet and the moisture is thoroughly pumped out of the soil for a greater depth than that. Potato roots penetrate to about the same depth, so it is necessary to get the water down that far if the best results from the potato crop are to be had.

When a potato planter is not available a plow or a cultivator with a furrowing out attachments are used. The potatoes should be planted about six inches deep and when a plow is used it is set to run about that depth. Enough furrows should be skipped to bring the planted furrows about two and a half or three feet apart. An important item is the irrigation that follows planting. We were told last yeai that if we knew as much about raising potatoes as a Chinaman, we would not have made the mistake that we did on that point. Our land was so thoroughly soaked and the potatoes so nicely started that we did not think an irrigation before the potatoes came up was necessary. As a consequence, the stand was so poor that it proved unprofitable. We learned from successful potato growers that an irrigation about a week or ten days after the potatoes are planted is almost always necessary to secure a good stand. When a plow is used for planting the land is left perfectly level when finished. About a week after planting, furrows about three inches deep can be made with cultivator attachments, irrespective of potato rows, and as soon after irrigation as possible, the land should be harrowed down smooth. When the planting is done with a furrowing-out machine that makes no more furrows, it might be practical to use the same machine for splitting the ridges and thus cover the potatoes and furrow out for the first after irrigation at the same timee. The after irrigations are important, and there are two views as to when irrigation should stop. At the Wyoming station it was found that the potatoes commenced to set when the blooms commenced to appear, and if they were irrigated several times before that period, there would be just that many sets or roots started and just as many sets of potatoes. As a consequence, there would be a large percentage of culls. If the potatoes were allowed to set and were then irrigated they would use up the moisture in development and a fewer number, but larger potatoes would be the

result. California practice seems to favor giving them an abundant supply of moisture up to the time that the tubers set and then withholding the water. This gives them a strong top and extensive root system that will properly mature fine large tubers.

The size of the seed is important as the plants continue to draw from it until quite large. Large seed pieces produce a larger precentage of large potatoes than do smaller ones, but there is a limit to this, it being more profitable to have the weight of seed distributed over a larger area. It was found that when planted eight inches apart in the row, the best yield was obtained.

In experiments carried on in the different parts of Wyoming, the following averages were obtained. As regards whole seed and cut seed, it was found that small potatoes planted whole produced a greater percentage of small potatoes than large tubers cut before planting. In every case, the small potatoes planted whole produced more than enough marketable tubers to offset the difference in large potatoes from large cut seed. Where the whole small seed was used for several generations, there was a tendency to lower the average size of the potatoes.

With Early Rose, small potatoes planted whole produced 83.4 per cent merchantable potatoes, while large seed cut, produced 93.4 per cent merchantable. On a given area, the small seed planted whole produced 14,230 pounds, 11,867 pounds of which were marketable.

On the same soil, same area and other conditions identical, large tubers cut, produced 3,180 pounds, 2,903 pounds of which were marketable. This was with Early Rose and with ten other varieties, there was but one which produced more per acre from large tubers cut, and there was but a difference of 300 pounds. With the other nine varieties, there was an average gain of 1500 pounds per acre in favor of small seed planted whole. In another test of 19 varieties, there was an average gain of 2100 pounds per acre in favor of small seed planted whole. Practically all of the seed grew. There were about 200 pounds more per acre planted of the small whole seed than of the large cut tubers. The gain in marketable potatoes was 3 per cent in favor of large tubers cut, but the gain in yield was 50 per cent in favor of the small whole seed. With Burbank, the gain in production in favor of small whole seed was 46 per cent over large cut seed, while the gain in marketable potatoes was 5 per cent in favor of the latter. With Early Rose the gain was 76 per cent in favor of small whole seed, the gain in merchantable potatoes was 5 per cent in favor of large cut seed. The gain from whole cut seed with Triumph was nearly double.

As to the size of the pieces when cut, it was found that when the tubers were cut to one eye and the seed end (that opposite the stem end) left on, the yield was about double that when cut to one eye wih the seed end cut off. The best results were gathered when the tubers were quartered endwise and the seed end left on. When tubers were cut to weigh about one and a third ounces, the results were better than when cut all sorts of sizes with the idea of getting a certain number of eyes to each piece. Seed cut to two eyes and planted 16 inches apart produced 11,637 pounds per acre and when planted 8 inches apart, 13,524 pounds. Cut to one eye and planted 4 inches apart produced 5,046 pounds, and when cut to two eyes and planted 4 inches apart, they produced 13,192 pounds per acre. When planted eight inches apart in the row and the rows two and a half feet apart, 700 pounds of seed per acre being used, the yield per acre was greater and the percentage of marketable potatoes was larger than when planted 18 inches apart in the rows with 500 pounds of seed per acre.

1,000 pounds of potatoes require from 3 to 5 pounds of potash, about 2 pounds of nitrogen and three quarters of a pound of phosphoric acid. It will be seen that potatoes draw heavier on potash than any of the three elements mentioned. The New York station tried experiments in which the full amount of potash required was applied to one lot and two-thirds to another. The latter (two-thirds plot) produced as much as the plot which was given the full amount. A plot which was given only nitrogen and phosphoric acid produced as many pounds of potatoes per acre as the plot which was given two-thirds the required amount of potash. When fertilizers containing nitrate of soda were used the potatoes were larger than when the nitrate was left out. Nitrogen has the reputation of making potatoees poor keepers.

* * *

SUMMER PRUNING RASPBERRY BUSHES.

The Wisconsin experiment station has been making a series of experiments in pinching back the shoots as they reach different heights. The experiments covered four years and Gregg and Cuthbert were used in the trial, 36 plants of each. It was found that pinching the Gregg when 24 inches high increased the yield, but decreased the yield of the Cuthberts. Pinching back when two feet high gave better results than when cut back when one foot high. A record of the number of shoots was kept and showed that pinching back increased the number on Gregg and decreased the number on Cuthbert. Pinching back increased the size of the berries on Gregg and decreased the size of Cuthbert. When the bushes were pinched once they filled up the space between the rows as close as those which were not pinched. When pinched twice the bushes were more dense than those which were not.

The following table shows the interesting average result of the four seasons' experiments:

YIELD OF PINCHED AND NON-PINCHED SHOOTS

TREATMENT	GREGG	CUTHBERT
Shoots not pinched	954 oz.	970 oz.
Shoots pinched at 12 in.	795 "	830 "
Shoots pinched at 12 in., laterals at 11 in.	1118 "	857 "
Shoots not pinched	814 "	996 "
Shoots pinched at 18 in	1150 "	864 "
Shoots pinched at 18 in., laterals at 12 in.	1046 "	908 "
Shoots not pinched	952 "	773 "
Shoots pinched at 24 in.	1261 "	992 "
Shoots pinched at 24 in., laterals at 12 in.	1182 "	773 "

GENERAL SUMMARY.—Extremely hot weather prevailed throughout the state on the 2nd and 3rd, accompanied by high northerly winds in the central and northern sections, with cooler weather at the close of the week. Fires destroyed several hundred acres of grain in the Sacramento and San Joaquin valleys, and forest fires caused considerable damage in the coast region.

Harvesting, threshing and hay baling are progressing rapidly in nearly all sections. The yield of grain and hay in Southern California is reported the heaviest for many years, and both crops are of excellent quality. Early wheat and barley are yielding fair crops in the central and northern sections, and nearly average in some of the districts, but fires and high winds have materially affected the crop. Late wheat is reported in somewhat better condition than expected in some of the northern coast counties, but the yield will be very light. Sugar beet harvest is progressing. Hops have made slight improvement in the past week and will probably yield a fair crop in some sections. Beans, corn, potatoes and vegetables are doing well.

The high winds caused much damage to ripening deciduous fruits in the central and northern districts, some reports stating that the loss will be fully one-half the crop. Peaches and apricots are dropping badly in portions of the Santa Clara valley. Fruit picking, drying and canning are progressing. Grapes and citrus fruits were not damaged by the wind and continue in excellent condition. The outlook is good for an unusually heavy yield of raisins.

LOGICAL.

A little Los Angeles girl learning to spell was told that oo in b-o-o-k was spelled b double o k, r double o t, root, etc. Afterwards in learning a few lines with "Up, up with the Lark," and of course applying the same rule, she said "Double up with the lark."

JULY VEGETABLE CALENDAR.

Those who have consumed the spring crop of vegetables may plant many of the same sorts as late as July and obtain splendid returns for their labor. Some few vegetables will grow even better than in cooler weather. In California it is not so much a question of season, but of care. The following may be planted during this month: Beans, beets, cabbage (late), cauliflower, lettuce, peas, radishes, potatoes, spinach and turnips. Radish and spinach may be planted in this climate every month in the year. To have them crisp and to prevent the radishes from having a strong taste the water supply must be unstinted.

* * *

A FINE NATIVE SHRUB.

Almost everyone is familiar with the red "Christmas berries" which are gathered so abundantly about holiday time. and some few know the virtues of the shrub for garden use, yet seldom do we see it in cultivation. As a rule it is found but sparsely foliaged and furnished with small flower heads, but the writer saw one a few days ago growing in the deep, rich soil of a hillside, that surpassed in beauty any "snowball" plant to be found. Doubtless the copious rains of the past winter have done much for our native trees and plants for they are unusually prolific this spring and summer. The shrub noted was about eight feet high, of a like diameter and a solid mass of white blossoms. These shrubs are easy to transplant at any age and will thrive under the most ordinary care.

* * *

ASTERS.

One of our principal crops for autumn flowers is the aster, and from now on they should be carefully watched. The plants are often attacked by red spider, which can be kept in check by liberal sprinkling. Too often the plants are injured by root aphis and these may be overcome by sprinkling tobacco dust around the roots of the plants and afterwards sprinkled with water to carry the tobacco water down. All these pests must be overcome before the flowering period as watering liberally over the plants often spoils the white ones by staining them. Asters like a rich soil and should be fertilized liberally. The asters of our garden are not true asters, botanically, but belong to the genus Callistephus; next week we will endeavor to illustrate and describe some of our native, true asters.

* * *

CHRYSANTHEMUMS.

It is not yet too late to propagate chrysanthemums either by cuttings or division of old clumps, and if you have some that are now one to two feet high (as the writer has) you may safely cut them down to the ground and allow them to start anew or cut them an inch or two above the soil and allow them to branch out from the base of the present stems. Chrysanthemums require lots of water but the drainage must be good. They are also gross feeders and should be fertilized heavily until the buds begin to show color, when all fertilizing must cease. Many commercial fertilizers are used by the florists and gardeners but liquid manure is a good old stand-by. The danger of overfeeding with liquids will be materially lessened if applied when the soil is wet rather than dry, Chrysanthemums will repay liberally for disbudding.

* * *

A PERNICIOUS WEED.

Last year about the present month, many complaints were heard both at this office and at the rooms of the Horticultural Commission, about a weed known locally as "Wild Prickly Lettuce." This plant, known to botanists as Lactuca Scariola, was very scarce but a few years ago, and like most undesirable vegetable growths was spread with alarming rapidity until now the farmers in some districts are unable to cope with it. It was shown the writer a few days ago by a farmer near Glendale, who said it was a new weed and impossible to eradicate unless dug out by the roots. In this he made no mistake, and the farmer is very unwise who allows any of them to mature upon his land by reason of their being "too much trouble to dig out."

The Cultivator has heretofore accorded to Petaluma the credit of being the greatest producer of eggs of any town in America. The reports for the past four months are now in. In that time there was an output of eighteen million eggs. Placing the average price at 25 cents per dozen the Petaluma owners of the hen received for the four months $383,011, or $95,767 per month, or $3,192 per day. They also sold 627 dozen of fowls, for which they received $16,815.

FERTILIZER CONTROL Unbiased Expert Advice

We are directing the fertilizing on many groves, and among our clients are some of the largest, oldest and most successful growers in California.

IT WILL PAY YOU AS WELL

Intelligent Fertilizing

Its Necessity—What Thomas C. Wallace of Riverside is Doing for the Growers of California.

A day spent with Thos. C. Wallace at Riverside, Cal., Director of the Fertilizer Control, enables the writer to lay before Cultivator readers the crucial points in the selection and use of fertilizers, and an explanation of the business Mr. Wallace is so successfully carrying on. He seems to have a complete mastery of his chosen calling, and expresses himself in as clear and simple a way as the discussion of such technical and difficult subjects allow, and makes no attempt to mystify.

* * *

INTELLIGENT FERTILIZING.

A time comes in cropping when the fertility of the soil becomes impaired below the requirements of paying crops, though indeed it is true that there is practically no such thing as complete exhaustion of any element in the soil, except, possibly, nitrogen. The actual nitrogen content of a soil may be so small through cropping that the land will not support crops, but this is not often the case. The mineral elements of the soil are never exhausted, but it is only a question of time when the mineral compounds which feed the plants become so exhausted that the soils are sterile. In broad farming, where a variety of crops can be grown alternately, and the system of rotation intelligently and systematically exploited along with the return of stable refuse, the inevitable sterility of some soil elements can be staved off for generations, but not indefinitely. Strenuous cultivation will accomplish much in hastening the weathering processes in the soil, but this in the long run was found to be mere vanity by the followers of the enthusiastic Jethro Tull. The day of reckoning has only been put off by clovers and other legumes which enthusiastic agriculturists have lauded as the very sheet anchor of the question.

Theorists discourse fluently on the "balanced fertilizer," but practice proves its uncertainty. Practical growers occasionally are led into advocating this or that "fertilizer" which for a while seems to have "done the trick." All these things fail because they are not founded upon sufficient data, and their exponents are as derelicts tossing upon the sea of guesswork. There is no royal road, and no golden remedy is to be found short of recourse to the most thorough and searching examination and study of each case in complete detail.

As we advance, the fertilizer question becomes more and more important, for it presents one of the most promising means of controlling the quantity and quality of produce and permiting continuous fruit growing as a business. The rapid growth of the fertilizer trade in all sections has emphasized this. Farms which a few years since were looked upon by their owners as practically of inexhaustible fertility are now being fertilized, and the neglect of this precaution has in the past been one of the causes for the desertion of lands once "flowing with milk and honey." Starvation must be the lot of some future generation if fertility is not maintained, and we stand to be cursed by future generations of our kin if we neglect such an important matter as the preservation of soil fertility.

* * *

NECESSITY.

Growing fruit trees is a distinct avocation and entails special methods of cultivation and fertilization. When the availability of a soil becomes exhausted, some suitable substance containing the required elements must be put into the soil, and also means should be taken to revive the unavailable soil compounds. Trees have long lives and throughout are affected by early training and feeding. If we develop a great rootspread when the tree is young, every fiber of it must find fertility or die, and a mass of dead roots in the soil is as harmful and unproductive as the tree top loaded with dead wood. If the roots develop deep in a soil in the early life of a tree, it will undoubtedly produce longer without artificial feeding than if the roots had spread out only in the surface soil, providing, of course, that the soil is loose to a considerable depth.

The moment that the assimilable condition of any plant food element becomes so exhausted that a plant cannot obtain its necessary amount of that food, the need for the application of fertilizers arises. It is the duty of the agriculturist to anticipate it and to take means to supply the want. Intelligent analysis of the soil will to some extent foretell the coming evil, and the behavior of the plant will show it only too plainly to the observant physiologist.

It is true economy to guard this point, for the weakened condition of the tree which has been for a year, or years, deprived of its full quota of any ingredient is much more difficult and costly to restore to health than if it had been taken as a "stitch in time." Besides light crops, poor fruit, and decay deplete the grower's purse.

Fertilizers are therefore a necessity to the business of producing all crops, but most especially to orchard crops.

* * *

PERPLEXITY OF THE GROWER.

It is well known that the growers are seriously perplexed over this problem and one does not have to look far for the reason.

If the grower applies to the chemist, he is told that his soil is rich in all the necessary elements of plant food; if to the soil physicist, he receives the answer that he must cultivate more strenuously and mulch his soil; the fertilizer dealer recommends his standard or special mixture as the druggist advises a poor woman to take one of his famous patent medicines for her ailment; his neighbors flock to his aid with their home remedies, or to recommend certain fertilizers which they think have "worked the oracle" for them. In a few years he is "stumped;" he has tried them all with varying success and financial loss, and concludes that it is a "grand guessing bee" and he throws up his hands in perplexity if not despair. An idea strikes him, he must go to the Institute to find out the remedy. Go he does, and is told to spend the rest of his life studying all the natural sciences. The writer can sympathize with our friend—he has been through it all and knows how it is himself. To meet this perplexity the grower wants expert help as the poor woman wanted a doctor; this help can be obtained through a practical and scientific worker, and it was to meet this want that Mr. Wallace, after many years of observation, study, practical work, and travel, established the Fertilizer Control.

* * *

As already stated, soils are never exhausted of their elements, but the part that is easily available and soluble is often spent below an amount to feed paying crops, or even to permit a continuous healthy growth, and then the potential plant food of the soil can be said to be sterile. The plants do not cease to grow entirely because the slow disintegrating forces of the air and soil are constantly changing the soil substances, making some of it available. It has frequently been found by experiment that this sterility may only apply to the plant then being farmed, and that putting another class of plants on the soil, it often succeeds admirably. This is largely owing to accumulation of excluded elements and to the excretory acids of one class of plants being stronger than that of others, and consequently being able to extract fertility from the less, or differently, soluble substances in which the soil abounds. When we study the immense potential power of the soil, we are impressed with the advisability of endeavoring to aid nature in reducing some of it to a condition to supply fertility to our plants. This is one of the main offices of fertilizers and should always be taken into consideration in selecting material.

Instead of proceeding on the hand-to-mouth plan of trying to directly supply the whole needs of the plant from commercial fertilizers, and thus using $1000 an acre land as sort of feeding box, we should take means to work up the potentiality of the soil into available plant food. Then by a much smaller application of fertilizer we can accomplish the most gratifying results. It is not uncommon to hear the complaint that a certain commercial fertilizer had hardened the soil or made it cloddy and difficult to work. In this case a step toward sterilizing the soil has been taken, and it is quite explainable if the exact character of the soil and the complete make-up of the fertilizer are understood. Fertilizing the soil without carefully examining into this detail cannot be called intelligent.

* * *

SIMPLE ANALYSIS NOT SUFFICIENT.

A mere quantitive analysis of the soil cannot be taken as a guide to the use of fertilizers. It has its place in the soil study and cannot be dispensed with. It merely shows the amount of each ingredient or element in the soil, and if the quantity of every element in the soil is determined, some judgment can be made as to the probable condition from a knowledge of known combinations of these elements one with another. But such judgment would be largely guessing, and cannot be depended upon. Qualitative analysis would go further if accompanied by a knowledge of the conditions necessary to meet the requirements of plants. Here is where chemistry and physiology meet and join hands. In fact the most complete and careful quantitative and qualitative analyses must be accompanied by studies of all the other details of the soil, plant actions and research into the results of designed or accidental experimentation. To fertilize intelligently all known practical facts or theories must be deliberately and patiently weighed. The service of analysis is as the basis of intelligent fertilizing, and forms a starting point for the determination of soil problems which must have their full weight in selecting the materials and ingredients to fed the plant.

* * *

A COMPLEX STUDY.

It is thus seen that soil fertilizing is a complete study, including at least chemistry, plant physiology, soil physics, bacteriology, agriculture and horticulture. Important as is a thorough knowledge of the manufacture and use of all kinds of fertilizer and fertilizer substances, it is not sufficient to base an intelligent system of fertilizing upon. Here in California, where we have soils magnificently rich in the mineral elements of first importance to plants, fertilization should be at its best, on soils under such exceptional control as our irrigation and tree cultivation allow, the fertilization "guessing contest" should not find a place. Dealing with expensive fruit crops, in an expensive way, on expensive land, we should not be content with hit or miss methods, but reduce every item to the most positive system obtainable. At the very foundation of production, sooner or later we must recognize the question of keeping up fertility both of the soil and in the plant, and the time is close at hand when intelligence in this line will gain its reward in increased crops of superior quality.

* * *

THE FERTILIZER CONTROL.

When Mr. Wallace was perfecting plans for the establishment of a bureau under the charge and direction of competent persons, to furnish information and give assistance to growers as to the best methods of soil fertilizing, and for bringing land to the highest state of productiveness, he determined to call the business "Fertilizer Control." The success he has already met with has demonstrated its importance and need.

This is the day of specialists and in every department of life we find that through specialization of work the highest degree of skill and efficiency is maintained. The day is past when one can hope to succeed by attempting to do a little of everything, and no where is this more apparent than in the attempt which some growers have made to be their own chemists and soil experts and to judge of the chemical needs of their orchards. The failure of many growers in this respect has made it absolutely necessary that many questions must necessarily be left to a man who is an expert in fertilizers and soil physics, a practical agriculturist and horticulturist. Mr.

Wallace is all these, as those who have employed him, met him at the Institutes and Clubs and read his many suggestive articles upon these subjects in the Cultivator and other journals can testify.

Many questions have been settled in regard to plant life and soil physics, and many more will have to be. New questions are constantly coming up which will be solved by the application of principles. new conditions will have to be investigated and experimented with to discover new principles and their application.

Mr. Wallace is a wideawake student and is fully alive to the fact that a great many questions in relation to plant life and soil physics must be settled in this part of the country in order to maintain fruit growing as a profitable investment. He is at present preparing and carrying out investigations and researches which he hopes will ultimately result in a great benefit to the grower, and when these investigations are completed he hopes to establish facts which will be of incalculable value to the citrus grower. As a practical agriculturist Mr. Wallace has a keen knowledge of methods of culture of soils which materially affect the action of fertilizers. Unlike most workers along scientific lines, we do not find Mr. Wallace relentlessly opposing the use of complete fertilizers, but on the contrary he advises their use under proper conditions. His policy is neither to oppose nor advocate any fertilizer unless it is the kind which would give to his client the best results under the conditions as he finds them. The matter of purchase is left with the grower to buy where he pleases. Mr. Wallace's sole aim is to give his client the benefit of his large experience and general knowledge at a minimum of cost. He becomes, in a true sense of the word, the professional adviser of those who employ him, as the physician becomes that of the patient.

* * *

METHOD OF PROCEDURE.

The practical manner in which Mr. Wallace goes about his work has won for him praise on every side. He visits the ranch, studies the condition of the trees or plants and obtains as complete a history of the soil as the owner can give, and all other information which might have a bearing upon the soil or plant life. In this way he obtains all knowledge that is possible by observation. His next step is to take samples of the soil, and this is done by boring to various depths and taking samples and subjecting the same to a chemical and physical analysis. In this way he gains a knowledge of both soil and plant which enables him to give proper directions as to the kind of fertilizers which can be most profitably used. He follows this up by visiting the land several times each year.

Mr. Wallace is a strong advocate of regular and systematic fertilizing, and is opposed to all spasmodic attempts such as have been unfortunately the rule with many growers. No good or permanent result can be obtained the grower starts right, obtains the materials required by both soils and plants, and keeps up the work year after year.

Contracts are made with the grower for one year or more at the nominal charge of one dollar per acre, per year, and actual cost of traveling, but no contract is made for less than twenty dollars. Payments are made half yearly. By the correct use of fertilizers Mr. Wallace is able to save his clients far more than the cost of his services. Quality instead of quantity is his motto.

* * *

ALREADY A SUCCESS.

The best evidence that the Fertilizer Control under the direction of Mr. Wallace has come to be a permanent institution among us, is the fact of the large number of intelligent and progressive growers who avail themselves of Mr. Wallace's services. Clients, among whom are the most successful growers in California, will be found scattered from San Francisco to San Diego, and new groves are being constantly added nearly every day. Wideawake and progressive growers cannot do better for themselves than by at once availing themselves of Mr. Wallace's services, as money invested in this direction by them is bound to return most profitable results.

C. H. SESSIONS, ASSOCIATE EDITOR

DAIRY NOTES.

Selma creamery is making 1400 pounds of butter daily.

The Golden Gate State Creamery Co., of San Francisco, announce the construction of a large creamery.

The annual meeting of the stockholders of the Hollister creamery will be held July 11th.

Colusa farmers are about to establish a creamery.

Last week the Minnewawa Stock Farm of Fresno shipped two registered Percheron brood mares to the University at Reno. This week they are sending 20 grade Holstein heifers to Tulare, and a registered Berkshire boar to Stockton. In the future their dairy herd will contain none but registered Holsteins.

Creameries in Humboldt county paid the following gross prices for butter fat during the month ending June 15th; Abrahamseu, 24½; Capital, 25; Coldbrook, 24; Cold Spring, 24½; Cream Valley, 25; Crown, 24½; Elk River, 24; Excelsior, 24½; Ferndale, 24½; Grizzly Bluff, 25; Independent, 25½; Silver Star, 25; Arcata, 24; Diamond Crystal, 23; Premium, 25; Minor, 22½.—Dairy and Produce Review.

The new creamery at Mt. Eden, in Santa Clara county, began operations June 15th.

The National Association of the State Dairy and Food Department will be held in St. Paul, Minn., July 21-24. The four days program is filled with addresses and papers by some of the most eminent specialists of the country.

W. M. March of this city, has sold his fine three-year-old Guernsey bull, Belfilius, to a Mr. Rodoni of Pescadero, San Mateo county. This bull was bought from F. W. Trapp of Westminster, Mich., and brought here by Mr. March last year.

At the annual meeting of the Holstein-Friesian Association of America, held at Syracuse about June 1, there were certain changes made in the advanced Registry which we give below. These changes we give almost in full because of the special interest which has been manifested in the butter-fat test. Heretofore the percentage of increase was considered to be one-fourth, whereas, as will be noted below, the present rule specifies that the increase shall be one-sixth. The following are the rules:

1. Requiring that a period of at least six days shall elapse after a cow drops her calf before an official test shall commence.

2. Requiring that the computation of butter from butter fat shall be made by adding to the amount of fat one-sixth of said amount, which shall then be given in pounds and ounces. This computation shall be made by the Superintendent of Advanced Registry, and the experiment stations shall be held responsible for only the amount of milk and butter fat reported by them. The requirements of butter fat to admit to entry in the Advanced Registry remain unchanged. For a cow calving at two years, or under two years of age, the minimum requirement being 7.2 lbs. butter fat in seven consecutive days; for a cow calving at just three years of age, 8.8 lbs.; for a cow calving at just four years of age, 10.4 lbs.; for a cow calving at five years of age or over, 12 lbs. Every day of increased age at date of calving from two to three years, from three to four years, or from four to five years increases the requirement .00439 of a pound per day.

3. The system of economic testing heretofore maintained is abandoned and in its place a requirement is made that in all cases in which the production of butter fat in seven consecutive days is 18 lbs., or more, the owner shall report, in connection with the production, the kinds and amounts of food consumed by the cow during the test, to his best knowledge and belief, under oath.

JERSEY NOTES.

The committee appointed by President Miller of the Jersey Breeders' Association, by authority of its board of directors, to make arrangements for the fair and buttr-fat test to be held this fall, consists of Messrs. E. E. Moore, Compton; Geo. W. Thomas, Riverside; C. W. Campbell, Los Angeles; A. B. White, Los Angeles; Geo. E. Platt, Los Angeles; and Mrs. L. J. Hastings of Los Angeles. This committee has power and instructions to make all arrangements and organize the fair and tests. It is probable the fair will be held about the first of October.

G. Y. Lytle has been known in Southern California as a most successful breeder of poultry. He has incorporated thorough business methods in that line of breeding and made it a money bringer. Now that he has launched in the Jersey breeding business it may readily be seen that he will get busier than ever and that Jersey breeding will, with him, prove a great success.

The American Jersey Cattle Club has issued printed proceedings of the thirtyfifth annual meeting which was held in New York, May 6.

THE JERSEYS AT ST. LOUIS.

The American Jersey Cattle Club is preparing to install a herd of Jersey cows at the Louisiana Purchase Exposition that will eclipse all previous Jersey exhibits. We are pleased to see that those who have the interests of the breed at heart are taking time by the forelock in the matter of preparing a creditable exhibit. It requires at least one year to make what might be called a fine selection when it comes to choosing forty record breakers. We sincerely hope that the contest will be taken as seriously by those who are looking after the interests of other breeds. With the rules and specifications that have been prepared for conducting the dairy test at the 1904 exposition, we believe that the best comparisons will be made in the history of the world.—Wisconsin Farmer.

INTEREST IN JERSEYS.

Orange, Calif., July 7, 1903.

Editor Cal. Cultivator: Glad to report continued activity in the Jersey line. Inquiries for Pacific Golden Lad calves are numerous. Will soon be able in some measure to supply the demand. E. M. Wheeler of Tustin, formerly of Los Angeles, a new man in the Jersey ranks, this week bought from me Pedro's Spanish Beauty, No. 169013, one of the most beautiful little cows ever bred in the state. Undoubtedly she will pass into the 14 lbs. a week list. There is never a lack of fanciers for this butter and beauty type. She brings him a Pacific Golden Lad calf shortly.

I have been a reader of the Cultivator from its beginning, and never appreciated it as highly as when reading this last issue. Was much pleased to see the interest extending north.

Geo. Y. Coutts.

NOT A RIVAL OF GOOD BUTTER.

The dairy business is safe from cheap imitation butter, but it is not safe from a competitor. Oleomargarine (uncolored) has come to stay and it will cut quite a figure; every pound of poor butter made gives oleomargarine another friend. Oleomargarine is preferable to poor butter and is bound to displace all poor butter on the market. It will never affect the better grades of butter because they are better than oleomargarine and people will buy them in preference; but poor butter will sell less and less, till in time it will be driven entirely from the market. People who will make poor butter should be compelled to eat it themselves, and with oleomargarine selling for what is and at its normal price, but little poor butter can find a place on the market.—Colon C. Lillie, in Michigan Farmer.

EFFECTS OF FOOD ON MILK.

After having looked carefully into the effects which food has on milk, the British Dairy Farmers' association has come to the following conclusions:

That when a cow is in full milk and full flesh she will give her normal quality of milk for at least a limited time, even though the quality and quantity of food be very deficient.

That when in good condition a cow will take off her body whatever is deficient in food, in order to give her normal quality of milk.

That an extra supply of nutritious food at all times increases the quality of milk, but the percentage of fat is not in any way improved by it; if anything, the tendency being rather the other way.

That an extra supply of nutritious food almost invariably very slightly increases the solids, not fat, of the milk.

That a ration poor in food ingredients has a very slight tendency to reduce the solids not fat in the milk, but has little appreciable effect on the fat.

That with a poor ration a cow in full weight will lose excess weight, while on a rich diet she will gain weight.

That, although the percentage of fat in a cow's milk may vary daily, we at present seem unable to control these variations or to account for them.

That for limited periods up to one month or thereabout, all ordinary quantities and qualities of foods seem to have no material effect on the quality of the milk.

That the only food which seems to have had any material effect on the percentage of butter in the milk is an excess of brewers' grains.

That very succulent grass has had only a very trifling effect in altering the percentage of fat.

That most foods convey some flavor to the butter, but scarcely any of them will alter the percentage in the milk.

That some foods exercise a material effect in raising the melting point of butter.

That the aim of all producers of milk, butter or cheese should be to feed what will give quantity in moderate amount and of a mixed nature, and the produce will be the best that the cow can give.

That extra quality must be looked for by improving the breeds, and judicious selection, rather than by any special foods or methods of feeding.

That the variations in the percentage of a cow's milk are caused by something, but what that something is we at present do not know, though if we did we might be able to influence the quality.

SCALE OF POINTS IN THE BUTTER CONTEST.

F. D. Coburn, chief of the live stock department of the St. Louis World's Fair, suggests the following scale of points by which to judge butter the scale is much the same as that used for several years, excepting the flavor and aroma are separated, heretofore always considered one factor.

Flavor	30
Aroma	15
Grain	25
Color	15
Salt	10
Package	5
	100

A. B. White's sale of Echo Glen Jerseys is proving successful, satisfactory prices prevailing. King's Victor King of St. Lambert and two choicest cows go to H. N. Williams of this city. One cow to J. H. Stafford of Compton. Other good animals to Mr. McKie of The Palms, John C. Keefe of Orange and others.

C. W. Campbell, of this city, phones us just before going to press that the request of the Southern California Jersey Breeders' Association for the appointment of one of its members as official butter-fat tester has been granted. C. S. Burgess of Riverside, has been endorsed by the club for that position and his appointment will doubtless be made. This appointment will place Mr. Burgess in charge of the butter-fat tests of the coming Jersey Fair, as well as recognize as official any private tests he may make.

Address all communications to
Dr. H. D. Fenimore, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given in this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

WARTY GROWTH.

Dr. Fenimore: I have a 4-year old Perchon gelding that has growth size of finger, nearly two inches long on tip end of sheath. Growth is of three months standing.—Subscriber, Anaheim.

Cut it off and touch the raw place with a little creoline on the finger once a day for a few days. Mix four ounces each of nitrate of potash and hyposulphate of soda, and one ounce of ground nux vomica give one tablespoonful in the feed once a day.

* * *

FISTULA OF THE TEAT.

I have a valuable Jersey heifer fresh for the first time; had a very much swollen and caked bag and I find that in one teat there are two openings, one about half way up the side of the teat. I would like you to tell me through the Cultivator if there is any thing could be done to close the second hole.—W. T. G., Chino.

Let the extra hole alone until the cow goes dry then pare the edges of the hole, make them raw, sew them together and with proper antiseptic dressings it will close nicely.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

FOWLS IN THE PHILIPPINES.

The Woman's Work in the Poultry Yard gives way this week to the following, which was sent in by Mrs. Basely's son, who is now in the Philippines. It gives a most interesting view of the poultry business in those islands:

The methods used by the natives as raisers and breeders of poultry in these islands would not meet with approbation from our enlightened American breeders.

The only thing that our native poultrymen care for are first lots of chickens and eggs, and secondly that the American soldiers shall not get hold of any of these unless he pays all that the aforesaid native asks for the fowl. This depends greatly upon the soldier's temper. If he is in a pleasant humor he may pay somewhere near the asking price; otherwise he takes the fowl on general principles.

The native as a breeder is hardly a success. He does not understand the advantage of having fowls that are well bred and therefore in the best condition for marketing purposes. With him, if a fowl appears sick or ailing, it is not a question of treatment and resulting cure; it is the will of the God and the fowl had better be killed and eaten to save its loss.

Poultry houses are a thing unheard of in this part of the world. All fowls have to get out and rustle for their individual living. An occasional handful of "mais" or corn thrown to them is all the attention they receive from their owner. Nests are anywhere that they can find a basket, box or sheaf of straw in which to lay their eggs. The eggs are small and not nearly so rich in flavor as the American eggs; they range in color from white to dark brown and are worth two cents gold apiece. Market fowls sell from twenty to thirty cents, gold, each. They seldom weigh over three or four pounds. The fighting cocks weigh from four to eight pounds and the color runs from pure white to jet black. The favorites most bet on are the "blancos" or whites; the bulecs or red and white (literally freckled) and the "negro" or black. In the year that I have been here, I have not seen a well bred chicken; though many of them bear evidence of some game breed; mostly Indian, and a few look to me a little like Sebrights, but most of them are what I have heard called "just common dung hill fowls." The hens are small and lay small eggs. They are terrible runners and flyers. From what I have been able to find out there are but four breeds common to these Islands. First are the Cochin Chinas, and here let me say it is commonly reported that the Chinese brought over the first poultry to these islands about five hundred years ago. Second, are the Jolos, originating in the island of Jolo; similar in appearance to the White Leghorn, but heavier boned and larger. Third comes the Costas, a sort of mongrel and mixed breed, and fourthly the black Spanish game. None of these are what we would call thoroughbreds.

The geese are a larger breed and range in color from pure white to a mixture of dirty gray, or black and white. They are not prolific layers; the eggs are strong to the taste and tough as is also the flesh of the goose. The natives eat the eggs of a large bird that looks like a cross between a gray crane and a heron. The egg is large and thick shelled; Its meat is tough and strong to the taste; the yolk being deep orange in color and the white blueish when cooked. The natives roll them in mud and salt as soon as they are cooked, claiming that they become thoroughly seasoned by so doing.

The ducks are domesticated wild ones, mostly mallard and teal, of which there are great quantities on the lake near here. They are small and the meat is strong and oily, due to fish eating. They lay fairly well and the eggs are fair sized. It is commonly supposed that foreign breeds of ducks came from China. The turkeys are not numerous and do not attain the size of Our American turkeys. They are brown or yellow in color and a few white; they lay fairly well, but the eggs are neither as large nor as well flavored as our turkey eggs.

C. E. BASELY.

ANSWERS TO CORRESPONDENTS.

We have four turkeys just a month old. Since they were about ten days old they have been hopping about, with distorted legs. We thought it might be leg-weakness, and gave them some pills, which had proven successful with chickens in leg-weakness. I could not see any improvement. They are hearty little fellows, excepting this leg trouble. I have fed them curd, corn-meal cake and plenty of green stuff. Can you tell me the cause, and also remedy?—A Subscriber, Watsonville.

Ans. The cause of distorted legs are several. The parents may have been too closely related; in-bred, or in poor health for some reason, the weakness may be hereditary, or it may be rheumatic, the result of damp quarters, or weakness from lice, or from indigestion, or liver trouble. It is exceedingly difficult without seeing the patients and their surroundings to diagnose a case. Look well into the quill feathers of the wings for lice and dust them well, rubbing the powder well into the roots of the feathers, move the little birds to new and perfectly clean, dry quarters, do not let them run out until the dew is off, give them charcoal to eat either in their cake or other food and try half a liver pill.

I have never had a sick turkey, but my neighbors have. One of them had turkeys dying, sent for me, I discovered lice, gave her some buhach powder to rub in and she saved every one.

Another had some dying with leg-weakness, swollen or distorted joints. She had tried everything she knew, fed them right, kept them clean, but it seemed as if they would die. She decided it was a case of certain death, but she had some liver pills in the house and she cut some in half, gave them to the turkeys, which were about six weeks old. They all recovered and lived to be eaten at Christmas. The neighbors (this was in the Mississippi valley where liver pills are a necessity) had turkeys similarly affected and fed them liver pills and they all recovered, so I would advise you to try half a liver pill. I never feed corn uncooked in any form to young turkeys; it seems to sour on their crops until after they have sported the red. After that they can eat anything.

Corn is not softened or partially digested in the crop, like other food, it goes on into the gizzard to be ground and afterwards digested, and is apt to sour or ferment on the way, so to avoid this danger I do not feed corn until they can swallow whole corn, when I feed it freely.

Coulson's Egg and Feather Food

Makes Hens Lay, Keeps Hens Strong and Healthy, Makes Feathers Grow. It costs a little more to begin with, but it is a richer and more nutritious food and is the cheapest in the end. Do not neglect to feed this food during the moulting season.

Coulson's Egg and Feather Producing Food

Is especially prepared to feed to moulting fowls, as it contains all thd elements necessary to make the feathers grow. Coulson's Egg and Feather Food is not a fattening food, but a food that makes muscle, bone and feathers. A hen may be extremely fat and yet not have the vitality to stand the strain of growing new feathers, and many hens die during the moulting process. If you want your hens to complete the moulting process quickly, and to have a beautiful, glossy plumage, just feed them all they want—a full meal at least once a day (and sometimes twice a day)—of Coulson's Balanced Ration Egg and Feather-Producing Food.

One man says that this year he has been feeding his hens Coulson's Egg Food and the hens have laid more eggs than any year before.

Another man who has been feeding Coulson's Egg Food for a year says that it makes the hens lay over the fence and lay everywhere, and you can gather the eggs by the basketful wherever you go.

It's good for the laying hens, it's good for the moulting hens, it's good for the growing pullets.

One Sack Will Feed Two Thousand Hens One Time

THE BATTLE-SCARRED BOY.

We put him to bed in his little nightgown,
The most battered youngster there was in the town;
Yet he said, as he opened his only well eye,
"Rah, rah, for the jolly old Fourth of July!"

Two thumbs and eight fingers with lint were tied up,
On his head was a bump like an upside-down cup,
And his smile was distorted and his nose all awry,
From celebrating the glorious Fourth of July.

We were glad; he had started abroad with the sun,
And all day had lived in the powder and fun,
While the boom of the cannon roared up to the sky
To salute young America's Fourth of July!

I said we were glad all the pieces were there,
As we plastered and bound them with tenderest care.
But out of the wreck came the words, with a sigh:
"If tomorrow was only the Fourth of July!"

He will grow all together again, never fear,
And be ready to celebrate freedom next year.
Meanwhile all his friends are most thankful there lies
A crackerless twelvemonth 'twixt Fourth of Julys.

We kissed him good-night on his powder-specked face,
We laid his bruised hands softly down in their place,
And he murmered, as sleep closed his one open eye,
"I wish every day was the Fourth of July!"
—Good Roads.

MRS. BUCKLER'S SWEET APPLES.

Autumn was just beginning to reveal herself in the heart of South Mountain—the gorgeous autumn of western Nova Scotia. It was about eight o'clock in the morning, and the air that streamed lightly over the shoulders of the hills had a most bracing savor. Mrs. Buckler, a freckled but comely and tall young woman, was just setting out for a twelve-mile tramp to the little settlement in the valley, where she had to return a flatiron and a pair of wool-cards which she had borrowed of an obliging neighbor.

Neighbors, in those days, were few and far between in the country districts of Nova Scotia. The great emtpiness created by the expulsion of the Acadians had not yet been filled up. For the neighbors, it behooved them to be neighborly.

Mrs. Buckler was an untiring worker, and her rare visits to the valley constituted her only holiday. She had to walk, of course, as her husband had no horse, and she had no ambition to ride one of the faithful but extremely deliberate oxen. And indeed, a matter of twelve miles seemed nothing of consequence to her.

"Be sure and get back before dark, 'Miry!" admonished her husband, leaning meditatively against the woodpile as he watched her kiss the children for good-by.

"Shooh! Steve, I reckon you can put the babies to bed all right for once, can't you? It ain't often I get off; and when I do, I like to make a good day of it!"

"I ain't lookin' after the children that I'm thinking of, 'Miry, as you know right well!" replied Steve Buckler, earnestly. "But you know how thick the bears are on the mountain this year; and there's no manner of doubt that was a wolf brushed by me in the pasture night before last. It ain't safe for you to be coming up through the woods after dark all alone that way. Stay all night if you find it getting late!"

"Oh! I ain't afraid!" averred Mrs. Buckler, stoutly.. "I may get back afore dark; but if I don't, I'll be careful and carry a light with me!"

These confident words she flung back over her shoulder, as she started gayly down the rough woodland way.

Arriving in due time at the settlement in the valley, she did her errands, picked up the news, and richly enjoyed the rare luxury of a gossip. Time went all too quickly; and it was on the edge of dark ere she thought of starting for home. Then, of course, there were vehement protests. Her friends urged her to stay all night, picturing the perils of the journey, and representing that her husband would never dream of expecting her. But Mrs. Buckler, as her friends always said, was very "set." Putting aside all arguments, she started out on her long and lonely tramp.

She had little to carry, but that little was somewhat troublesome to manage. It was an apronful of sweet apples for the children, a treat which she knew they would enjoy. Sweet apples were then a rarity in South Mountain.

When at length Mrs. Buckler reached the last house on the edge of the valley, and found herself face to face with the long climb up the mountain, she felt compelled to acknowledge in her heart that the night was very dark. And she had yet nearly four miles to go, through almost unbroken woods. In those four miles there were but two cabins to break the monotony of the way; and the further of these was a mile and a half from her home. She hesitated a moment, then went into the house, and asked for a pine-knot to light her on her journey.

Here again she was urged to stay; but lighting her torch she set her face resolutely to the mountain side. As she penetrated among the ancient trees the unsteady light of the pine-knot cast strangely moving shadows, and monstrous shapes seemed to spring up and disappear on all sides. For the first time she grew nervous, and felt an inclination to glance over her shoulder. This she presently conquered, with some scorn. Nevertheless, she could not help hastening her steps; and the first cabin in the mountain had the air of a refuge to her, as she turned in to get a fresh pine-knot.

Here, too, she was strongly pressed to end her journey for the night. But now her obstinacy was well aroused. She was nettled at herself for having felt afraid. It was with something of the air of one who goes forth to battle that she gripped her torch and clutched her apron of sweet apples, as she turned again to the blackness of the forest path.

Between this cabin and the next the distance was but half a mile. Her nerves were now getting so well steadied that she no longer cared for the looming and shifting shadows, till at length a shadow distinctly smaller than the rest made the underbrush rustle audibly with its motion. Her heart gave a most uncomfortable leap, and she straightway thought of the wolf which her husband had spoken of. But, wolf or shadow, it fled away without menacing her; and she came in safety to the last cabin between her and home.

Here the neighbors were asleep, and she had to rouse them in order to beg another pine-knot. The one which she had got at the previous house was by no means burned out, but she feared lest it should fail before the end of her journey. The sleepy neighbors were astonished at her appearance. They threatened to detain her by force, when she refused their invitation to stay all night with them. But Mrs. Buckler was by this time a good deal "worked up," as she afterwards expressed herself; and she treated their kind persuasions with scant courtesy. She almost ran from the house; but in her apron, among the sweet apples, she carried the extra pine-knot, all the same.

To ward off unpleasant thoughts, she kept picturing in her mind the way the children would enjoy the apples in the morning. She also thought of the remonstrances, tempered with ill-concealed admiration, with which her husband would greet her return. Her blood quite glowed again as she thought of the lofty fashion in which she would make light of it all. Just at this moment she saw, in the middle of the path before her, a large black bear, watching her curiously.

Her heart stood still, and she herself instantly followed this example. Then she reflected that she must appear calmly indifferent, if she would hope to escape. Slowly she moved forward again, waving her torch; and the bear, stepping out of the path, watched her steadily from among the underbrush as she went by. Then he stepped back into the path and followed her.

Her first and most natural impulse was to run like the wind for home, but this, after one startled leap forward, she checked with a mighty effort of her will. She walked on with swift but steady steps, watching the bear out of the corner of her eye, but all the time clutching obstinately her apronful of apples. The bear, very slowly, kept drawing closer and closer, bent upon attacking her, but evidently deterred by the dread of the torch.

But the torch, meanwhile, was burning low; and Mrs. Buckles, in her excitement, failed at first to notice this. She was holding the pine-knot over her shoulder, as a sort of shield against her pursuer. When, with a shaking at the knees, she realized that it was on the point of flickering out, she tried hastily to light the other; and in the effort some of her treasured apples fell out of her apron, and rolled behind her on the path.

As soon as the bear came to these apples he stopped, and began devouring them with the keenest relish.

"Why!" thought Mrs. Buckler, with a sudden lightening of her load of terror; "it's not me he's after, but the sweet apples!" and straightway all her old courage returned.

She paused, and took time to light her new pine-knot deliberately and well. Then she hurried on; and it was some minutes before her pursuer was again at her heels.

And now, so sudden are the revulsions of a woman's feelings, she was concerned only for the sweet apples. They were the children's apples; and it went sorely against her grain to let a bear have any of them. Not until he had come most uncomfortably close could she bring herself to again propitiate him; and then she doled out but three of the precious green globes, dropping them on the path behind her with slow reluctance.

The animal took perhaps a quarter of a minute to dispose of this niggardly contribution, and then came on again with a sort of hopeful confidence.

"No," declared Mrs. Buckler, firmly, " you ain't goin' to have another one!" and she fairly broke into a run. But when that heavy, shambling gallop sounded close at her back, her resolution weakened, and she dropped a couple more out of the apron. While the much gratified bear delayed to eat these, she rounded a turn of the road, and was gladdened by the sight of her own window glimmering some two hundred yards in front.

Calling her husband's name two or three times at the top of her voice, till she saw him fling open the door and rush out to meet her, she hugged the remnant of the apples to her breast, flung her torch at the bear, and sped like a deer toward the house. Whether the bear followed her further or not, she never knew. It certainly did not come near enough to the house for her husband to catch sight of it, for, as she flung herself into his arms, panting, triumphant, half way between laughter and tears, he asked her what was the matter.

"Matter!" she cried, indignantly, "That's just like a man, after all I've gone through to get home!" and she pulled him violently into the house and slammed the door.

Steve Buckler was quite too judicious to remind her of the fact that he had urged her either to come home before dark, or else stay all night. He did not even let it appear in his face for an instant that he thought of such a thing. He listened to the story with all the breathless excitement that she had anticipated, praised her bravery and resource, vowed to shoot the bear next day, ate one of the sweet apples, and then, being very sleepy, went to bed. But Mrs. Buckler, before she followed his example proudly tucked several of the apples under the children's pillows.—N. Y. Independent.

"But why did they break off the match at the last moment?" "Oh, the color of his hair killed everything in her trousseau."—Life.

Los Angeles Markets.

Los Angeles, July 9.

Peaches are arriving in large quantity and of good quality. The first shipment of a full car arrives today. It is of Alexanders and Crawfords.

Cherries are about at end of the string. All that come are quickly picked up at $1.25.

Extra fancy 'cots still command 2c in a jobbing way.

The scarcity of feed is holding butter firm, though there is no material advance since last issue.

Eggs are firmer and supply hardly up to demand.

Poultry, as susual, in strong demand.

Potatoes strong and not as many in market as it would take up.

Job lots, f. o. b., Los Angeles, are quoted:

SAMSON IRON WORKS STOCKTON CALIFORNIA

San Francisco Markets.

San Francisco, July 9.

Dairy.

Butter is much the same as last week, quotations being identical, but if anything the demand is slightly less, with a weakening tendency. Cheaper grades of butter are in abundance, which tends to bear the market. Some sales for fine stock are reported at 26. Receipts are reaching to 80,000 to 100,000 pounds per day. Quotations are:

BUTTER—Per lb:

Creamery, extras	.25	
Creamery, firsts	.23	24
Dairy, extras	.22	@22½
Dairy, firsts	.20	@21
Store	.18	@19

CHEESE—Per lb.

Cal. Creamery, mild, new, extra	.13	13½
Cal. Creamery, mild, new choice	.12	@12½
Young America	.13	14
Eastern, New York Cream	.18	19

Eggs and Poultry.

There is a slight change for the better in eggs. Better grades are quickly taken. "Dirties" and ordinary stock slow sale.

EGGS—Per doz:

Ranch, selected large	.20	21
Ranch, good to choice	.18	19
Store	.15	@17
Eastern	.17	@19

POULTRY—Old Roosters, per doz., 5.00@5.50; young Roosters, $8@10; Fryers, $5@6; Broilers, large, $3.50@4; small, $2.50@3; Hens, $4.50@6; Ducks, per doz, old, $3.50@4.50; young, $4@5; Turkeys, nominal; Geese, per pair, $1@1.50; Goslings, $1@1.50; Pigeons, per doz, young, $1.75; do, old, $1.50@1.75.

Fruits and Vegetables.

The fresh fruit market has been more or less unsteady with much indifferent fruit offered. This depressed all prices and gave buyers the advantage. Choice stock was quickly picked up.

Peach are yet hard and green and reported as not attractively packed.

Bartlett Pears are in slightly increasing quantity but as outside demand is yet slight the price is not satisfactory.

Handsome apples, with neat pack, are wanted and would command above the market at this time.

Nutmeg melons are coming in from Winters and command full quotations. Coachella supplies most of water melons and cantaloupes market however.

Berries are steady, with surplus taken up by canners, which steadies the market.

Vegetables are abundant and values for several descriptions showed marked depreciations. Both Tomatoes and Green Peppers are arriving freely in large quantities and receipts in ecess. Green corn is also offered freely at reduced prices, supplies being exceptionally liberal.

Quotations are:

FRESH FRUITS.—Apples—Per box, common to choice, 25@75; fancy, $1@1.25.

CHERRIES—Per box: Black, 75@85c; Royal Anne, 65@85c; bulk, per lb., 6@8c; Royal Anne, 6@8c.

PEACHES—Per box, 35@65; basket, 30@50c.

PEARS—Per box: No. 1 Bartlett, $1@1.25; other varieties, 35@$1; basket, 20@35c.

PLUMS—Per box or crate, 25@75c; baskets, 15c@40c, as to variety.

Dried Fruits, Nuts, Etc.

Previous prices still rule and are well maintained for the spot stocks of Dried Fruit, although the outward movement is of a small jobbing character. Speculation in futures continues very small, operators being skeptical and showing but little interest. Apricots are being freely offered in the San Joaquin section at from 7c to 7½c, but no liberal transactions have been reported. The first arrivals of new comb Honey have found an excellent market and slightly firmer rates are now being asked.

DRIED FRUITS.—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1902 crop are, per lb., as follows:

Apples—Evaporated, 4@6½c; Sun Dried, 3@4c.

Apricots—Royal, 6½@8½; Moorparks, choice, 9c.

Peaches—4¼@6½c; peeled, in boxes, nominal.

Pears—4¾@9½c.

Plums—Pitted, 4½@6c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 2⅝@2¾c with ½@1c premium for large sizes.

Nectarines—Whites, 4@5½c.

Figs—White, 5½@6c; Black, 5c.

NUTS.—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Pecans, 11@12c; Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c; Chestnuts, Italian, nominal.

HONEY—Comb, per lb., nominal; Extracted Water White, 7c; Light Amber, 6½c; Dark Amber, 5c.

BEESWAX—Per lb., 32c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1902 crop: Loose Muscatels, 50-lb boxes, per lb., 2-crown, 5½c; 3-crown, 5¾c; 4-crown, 6c; Seedless, loose Muscatels, 5c; London Layers, 20-lb boxes, per box, 2-crown, $1.40; 3-crown, $1.50; fancy clusters, 4-crown, $2; Dehesa, 5-crown, $2.50; Imperials, 6-crown, $3. These prices are subject to change without notice. Seeded, f. o. b. at Fresno, per lb.: Fancy, 16

Live Stock.

Conditions in live stock market are much the same as last week:

Quotations are:

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin steers, 7@7½c; No. 1 Cows and Heifers, 6@7c; second quality, 6@6½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 5@5½c, gross weight; heavy, 4½@4¾c, gross weight.

SHEEP—Per lb.: Fat Wethers, No. 1 4@4¼c, gross weight; Ewes, No. 1, 3¾@4c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb., live weight.

HOGS—Per lb.: Hard grain fed, weighing alive 140 lbs and over, 6¼@6½c; weighing under 140 lbs, 6@6¼c; weighing 260 to 350 lbs., 5¼@6c; rough heavy, 5½@6c.

Hay and Feed Stuffs.

HAY AND FEEDSTUFFS.

HAY—Prices on New Hay, per ton: Wheat $9.50@12.50; Wheat and Oat, $9.50@12; Oat, $8@11; Barley, $8@10.50; Clover, $8@10; Alfalfa, $8.50@$10.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50.

FEED CORN MEAL—Choice grades, per ton, $27.50@28.50.

MIDDLINGS—Per ton, $27.50@@28.50.

BRAN—Per ton, $24.50@25.50.

CRACKED CORN—Choice quality, per ton, $28.50@29.50.

Holders report a slightly increased inquiry for the leading descriptions of Beans, more especially Pinks, but as buyers' ideas as to prices are slightly below sellers' asking figures no important sales are consummated.

Wheat seems to share stronger tendency and is slightly higher in price.

BEANS—Prices per ctl: Large Whites, $3@3.15; small, do, $3.15@3.30; Pea, $3.25@3.50; Lima, $3.50@3.65; Red, $2.90@3; Pink, $3@3.15; Bayo, $3.65@3.75; Blackeyes, $2.75@3; Red Kidneys, nominal.

Hops.

The prices for new crop are 18 @20c per lb, according to quality.

MARKET NOTES.

Apricot drying and canning is on in full force this week. This crop in Southern California will go a little over half of last year, but the quality will be very much better. From $15 to $20 per ton is being paid for ripe apricots. There is a little demand for July delivery of dried 'cots at 7 cents. No prices offered for regular crop.

THE FOREIGN ALMOND MARKET.—One of the most reliable informants, located at Aix, in Provence, advises: The frosts have seriously damaged the growing crop in this region. We shall have probably one-fourth of the ordinary crop; last year we had a half crop. A good average crop should give to us in France from 25,000 to 30,000 bales. Spain should furnish this year a very large quantity of almonds. The crop in Italy will also be good, particularly in Sicily and at Bari. As we receive in Aix a large quantity of almonds from Italy, Spain, Morocco and the Levant, and subsequently remove the kernels, classify them and subject them to the industrial preparation which public taste requires, it as fair to assume that the exportations from this market to the United States will undergo no diminution. Such is our sincere belief in spite of the bad prospective in this immediate region." Another correspondent writes: "All in all, the crop of 1903 will be good."

ITALY.—Everything points to a good crop in Sicily and Sardinia.

SPAIN.—From the Balearic Islands, a good crop is announced, and we have the same news from the province of Alicante, and the coast of Tarragona. Some damage has been done in Aragon by bad weather.

THE RAISIN CROP.—Report of the Consulate of the U. S., at Valencia, says: Present prospects for raisins are exceptionally hopeful, and, under a continuance of favorable weather, conditions point to a crop of 600,000 cwts. as compared with 380,000 cwts. in 1902, 495,000 in 1901, and 587,200 in 1900. No stocks whatever remain in the district and in foreign European markets are practically exhausted, only 200 tons remaining in London. It should, of course, be remembered by California growers that the early promises of big raisin crops in this district are seldom fulfilled. The period of growth between the formation and harvesting of raisin grapes is particularly exposed to brusque meteorological changes, and a hot wave, a hailstorm, or protracted drought, frequently reverses the fairest prospects.

Report of D. R. Birch, U. S. Consul, Malaga: Reports from reliable sources indicate that the Malaga raisin production of 1903 will exceed in size the 1,000,000 box crop of last year, which was rated as the largest yield for 15 years. This is the present outlook conditional upon the prevalence of favorable weather from now on until the first week in September, when the raisins are prepared for shipment. Advices received from the surrounding country are to the effect that the vines at present are burdened with fruit to an extent unknown for many years. Optimistic growers profess to believe that the forthcoming crop will reach one million and a half of 22 lb. boxes. These figures are, however, in the opinion of local exporters, somewhat too high, even in the face of exceptionally fine weather conditions.

Eastern Markets.

New York General Market.

NEW YORK, July 8.—Wheat; Spot dull; options closed ⅛c lower; July closed 84¾; September closed 82¼; December closed 81¾. Hops steady. Hides dull. Wool firm. Petroleum steady. Coffee spot quiet. Sugar, raw and refined, steady.

Grain and Produce.

CHICAGO, July 8.—More favorable weather in the Northwest caused an easier feeling in wheat at the start today.

Cash quotations were as follows: Flour was steady; No. 2 spring wheat, 78@79; No. 3, 75@78; No. 2 red, 78½@79½; No. 2 corn, 51@52; No. 2 yellow, 51⅛@52; No. 2 oats, 41; No. 3 white, 37@41½; No. 2 rye, 51; good feeding barley, 40@43; fair to choice malting, 47@51.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	34,600	18,300
Wheat, bushels	52,300	124,500
Corn, "	459,000	133,100
Oats, "	542,000	116,100
Rye, "	16,200	....
Barley, "	66,000	....

Chicago Live Stock.

CHICAGO, July 8.—Cattle—Receipts 12,000, including 5000 Texans; market 10@20c higher. Good to prime steers, 4.90@5.45; poor to medium, 3.90@4.75; stockers and feeders, 2.50@4.40; cows, 1.50@4.25; heifers, 2.25@4.40; canners, 1.50@2.80; bulls, 2.25@4.00; calves, 2.50@5.75; Texas fed steers, 3.35@4.45.

Hogs—Receipts, 30,000; tomorrow, 25,000; left over, 5500; 10@15c lower. Mixed and butchers,' 5.40@5.65⅛; good to choice heavy, 5.50@5.60; rough heavy, 5.25@5.45; light, 5.50@5.80; bulk of sales, 5.50@5.80.

Sheep—Receipts 12,000; sheep and lambs, steady to firm. Good to choice wethers, 3.75@4.00; fair to choice mixed, 3.00@3.50; western sheep, 2.50@3.75; native lambs, 3.00@6.50; western lambs, 3.50@6.10.

California Dried Fruits.

NEW YORK, July 8.—The market for evaporated apples is quiet and prices unchanged. Common, 5@5¼; prime, 5¼@5¾; choice, 6; fancy, 6½@7½. Spot prunes are firm. Prices range from 3 to 7 cents for all grades. Apricots are steady and unchanged at 7¼@8½ for choice, and 10@12½ for fancy. Peaches are quiet and without feature; choice, 7@7½; fancy, 8@10½.

DAIRY MARKETS.

NEW YORK, July 8.—On the Produce Exchange today the butter market was steady; creamery, 16@20; dairy, 14½@18; eggs, setady, 13@14½; cheese, easy, 10@11½.

CITRUS MARKETS

ORANGE MARKETS.

The orange market is slightly more satisfactory than last week. However, much of the fruit is arriving in bad condition. This especially applies to navels, seedlings and sweets. Valencias as a rule have arrived in good condition, although some of this fruit has shown decay. Fine stock has found ready sale, but off sizes and some lower grade fruit have sold so as to give red ink returns to the grower.

LEMONS.

The lemon market has shown marked improvement because of the heated term which has prevailed through most of the East. The fruit has been arriving in good condition and good quality, and most satisfactory terms have been given to growers. The poorer stock, especially ripe picked, have shown some decay and made poor sales.

The total shipment from November 1st to date aggregate 20,142 cars, of which number 2,025 are lemons.

The following prices from the Eastern auction markets will give an intelligible idea of the prevailing markets over the East.

NEW YORK, JULY 1.

C. C. U., Redlands, Camellia Mikes, $3.40. Blossom Mikes, $3.05. Blossom sweets, 5 per cent decay, $3.65. Blossom seeds, 7 per cent decay, $2.30.

The DUPLEX STEP LADDER

The Step Ladder That Is An Extension Ladder

To the Orchardists of Southern California: An all purpose ladder, the article so long desired, is offered to you in the "DuplexStep Ladder." It is a ladder that combines all the advantages of a step ladder, and at the same time a full length ladder. It is a step ladder that can be locked in the hinges at any angle. It is a straight ladder double the length of the step ladder. The Patent Step Fastener used on the Duplex Ladder is perfect, and completely overcomes the tendency of the step to break loose from the sides. The Duplex is made from selected spruce, a wood that gives the greatest strength with the least weight, To see it is to admire it. A hardware dealer in every town sells it.

California's Big Grain Fields.....

Nowhere in the world has the handling of grain on the farm reached the degrees of perfection which it has in California. That great central valley, running three-fourths the length of the state, is one great hay and grain field. Not to the exclusion of all other forms of farming, for in it there is produced most of the raisins of the world, as well as all kinds of fruits, all varieties of agricultural products, and dairies that are the pride of the country.

Delivering Grain—Fresno County.

Yet we repeat, as a rule, the Great Valley from Tehachapi nearly to Shasta, is a great grain field. These great plains that pass the car windows for hours are filled with busy men, maneuvering labor-saving machinery that is a wonder, and enables the cheapest handling of grain.

The land is plowed by steam power, often, the harvesting is done by combined harvesters and threshers that go through the standing grain and leave behind the cleaned and sacked product ready for market.

This economy of farming is appealing to Europe—even Spain is awakening. In a call at the office of the Holt Manufacturing Company, at Stockton, recently, we were informed by Manager Dickinson that one of the traction engines, so popular in this state, had been shipped by this company to Spain and was now working on one of the big estates there. Outside the shops were dozens of the monster "tractions" waiting to go to fields to work on this season's crop.

More spectacular, perhaps, than the engine drawing the "combined," is the original horse and mule power. Thirty horses on one machine makes a large caravan. The number of horses has been vastly reduced this year in some cases by an invention of the Samson Iron Works of Stockton. Or rather the application of an idea. It is simply the placing of a gas engine on the thresher to propel the machinery. This gives uniform motions, takes only enough horses to propel the manchine and is proving satisfactory.

From field the grain goes direct to mill, or ship, or possibly to storage. Stockton alone has storage for 175,000 tons of grain.

Benjamin Walton, of Los Angeles county, makes a strong appeal for a bounty on coyotes. He says they kill vast numbers of chickens, turkeys, pigs and lambs, and are a discouraging feature in the small stock industry. This is not only in the outlying foothill ranches, but in thickly settled sections. Mr. Walton urges the Los Angeles Chamber of Commerce to take the matter up. If Wiggins didn't have the World's Fair on his shoulders the coyote might have to go. But really the coyote problem is worth considering.

Combined Harvester and Thresher.—Cuts, threshes, cleans and sacks grain at $2.00 per acre.

A Fresno County Irrigating "Ditch."—As one nears Fresno from the north, after riding for hours through the grain fields, he will see many new irrigating canals, not yet filled with water. Nearer Fresno the larger canals filled with water are large enough for row boats.

Essentials of Silo Building.

The silo has not found the welcome in California which it did in the East with its winter seasons. The ease with which a farmer may provide green feed much of the year is the probable explanation. But even here year by year the silo has grown in favor. It has resulted in greater flow of milk and in a most economical feed.

The feed may be used at once, or it will keep for (it is claimed) five years. Corn is of course the favorite, alfalfa being preferred as hay to using it for ensilage. Sorghum is a good addition to corn for silage but too acid if used alone.

Forty to fifty pounds of silage per day per cow is the usual feed. Well matured corn silage at the bottom of a 30-foot silo will weigh fifty-five pounds. At the top it may not weigh more than thirty pounds. The average for the thirty-foot silo is, to be more exact, 39.6 lbs. per cubic foot. So a ton would occupy about 50 cubic feet or a little over. A silo 30 feet high and 15 feet in diameter would contain 115 tons of silage from well matured corn.

In five pounds of silage there is 1.25 pounds dry matter, .06 protein, .67 carbohydrates and .03 fat, or a nutritive ratio of one to 11.7, as compared to beet pulp, we may add five pounds to beet pulp. We may add, in five lbs. dry matter, .05 protein, .37 carbohydrates, .006 fat, nutritive ratio, one to 7.6. Doubtless the value for feeding would be nearly three to one in favor of corn silage.

It is claimed by an Eastern writer that a cow in full milk and taken from good corn silage and put upon the best blue grass pasture will shrink materially in flow.

If these statements prove anything it is that silage is a profitable and excellent feed. Therefore some of the

Circulation this issue 8,000

At a recent meeting of the Riverside Farmers' Club an extended discussion was given to the black scale pest and how to destroy it in the orchards about Riverside. Fumigation was sustained by some of the growers, some going so far as to say that they would not tolerate a spraying outfit in their orchards. The majority, however, decided in favor of the spray being the cheapest and most effective plan of work. The decision was finally reached to appoint a committee to try and organize the growers of different communities so that each community, aggregating about 100 acres, should pool together and buy a spraying outfit. It is estimated that to cover that section twenty machines will be required. The committeemen appointed to carry out this work are: J. R. Cuttle, J. H. Reed, A. J. Everest, S. L. Wright, B. B. Wright, L. F. Darling, H. E. Meacham, C. E. Kennedy, F. D. Hudson, Reginald Brindsmeade.

The California building at the World's Fair will be patterned after the old mission type for which the State is noted. It will embrace the characteristics of the old Spanish architecture.

New hay coming into the Northern markets is of the best quality, but it is apparent that there will be a very short crop with probable high prices.

Lindsay, Tulare county, has shipped about 60 cars of Valencias this season. This is the heaviest Valencia shipping point north of Tehachapi.

It cost the taxpayers of the State of California $10,446,773.36 to maintain the state government during the fiscal year just ended.

Report has it that the Oregon prune outlook for this season is favorable to an immense crop.

There is no higher calling given than that of the farmer. In a large sense he is a creator.

BIG FLEAS HAVE LITTLE FLEAS.

The study of insect life brings out most interesting information to one who has the patience to follow his studies closely enough. Not the least interesting phase of this tiny life is the incessant warfare of other forms of life upon it. Usually the warfare of the smaller upon the greater. If it were not for this fact the life of the soil tiller would indeed be a burden, with all the myriads of insects increasing in their natural way and destroying all vegetable life before them. The pest of "army worms" so-called, this spring, gave something of an idea of the conditions which might prevail.

But fortunately this "worm" has its parasite and of all the milions of the larva which went into the pupa state, but few hatched into the butterfly to reproduce another "army" next year. Their lives were sacrificed to give life to a far smaller insect, a parasite, the egg for which was deposited on the caterpillar.

These facts were shown a Cultivator reporter by that indefatigeable worker, S. A. Pease, horticultural commissioner for San Bernardino county, at his office, recently. Mr. Pease has a room full of insects and of object lessons which are well worth the time of a visit. He has branches and foliage and fruit, all showing ravages of scale, or of mite or of aphis or other pest. He has case after case of insects, and can tell much of interest of their life habits.

Of course at the time of the visit of the pest of "army worms" the larger part of which "army" consisted of Pyrame's cardui or Painted Lady, and in part of Peridroma saucia, or the more common cut worm. Mr. Pease proceeded to study what is in store for us another year. A large number of the pupae were housed in glass jars and developments waited. Only a very few ever matured. The greater number brought forth life in a different form. Mostly a very small fly, though some a large fly, larger than the common house fly. These Mr. Pease has sent to Washington for a name and for their life history.

The larvae of these flies had spent their existence in the body of the caterpillar and in the chrysalis , the death of which they caused. Next year there will be no army of caterpillars because of these parasites.

This is not an isolated case. It is only an example of hundreds of others like Vedalia Cardinalis, Rhizobius, Comys Fusca, and "so on adinfinitum."

NOBODY CAN HELP IT.

Referring to the element of fruit growers at Highlands which has joined in with New York fruit commission men to form an association to handle fruit independent of the California Fruit Agency, the San Francisco Chronicle says:

"It is queer to note how easily farmers can be fooled. The Citrus Union of the southern counties is an attempt to unite farmers and shippers of citrus fruits in an effort to obtain from that product all that the traffic will bring and divide the proceeds as the parties in interest can agree. There has been no suggestion that the proposed division is unjust, and whatever one's opinion as to the "morality" of "trusts" of any kind, it is obviously to the interest of all growers to get into this one. Eastern dealers, however, are not likely to become agents of the trust, object to being shut out, and readily find confederates on this side who are ready to assist them in getting "outside fruit."

It is difficult to see why the owners of these 500 acres of orange groves should wish to sell in a competitive market when they have a chance to join a monopoly. They have simply been stirred up and fooled by commission men who want to get their fruit. Nobody can help it.

As to the "trust" feature of the above see Mr. Jeffrey's article on next page.

The largest tree in Oregon was felled recently to be sent as a curiosity to the World's Fair. It is the Aberdeen spruce and stood nearly 300 feet high, 40 feet around and 118 feet from the ground to the first limb. Its age is calculated at 440 years, being a good sized tree when Columbus discovered America.

CLAIMING TOO MUCH.

Press reports from Berkeley are to the effect that Professors Woodworth and Clarke, who have been experimenting on the codling moth in the Pajaro valley have completely exterminated that pest and have discovered that Paris green is an efficient remedy for it. Professors Woodworth and Clarke are both modest and scientific men, and can hardly be responsible for the many absurd statements made by the Berkeley press agent who deals more in sensations than facts and whose almost daily statements in relation to the work of the University entomological department evinces his ignorance and places it in a ridiculous light. The University professors have been carrying on a series of carefully planned experiments against the codling moth, using most of the known compounds, and some new ones. They have concluded that the old reliable Paris green spray, when rightly applied is the best remedy so far known. They have kept a careful record of their work, and when the results are fully known there is no question but that their labors will be beneficial, and tend much to the control of the pest nereafter. This will be glory enough. But in their own interest they should shut off this news maker who has stated that they have discovered the life history of the codling moth, given us the Paris green spray, and saved the entire apple crop, and all this before the season is half over, or their investigations nearly finished.

BERRY GROWERS ORGANIZE.

The effort to establish a berry and small fruit growers' association, with the object of better distributing and handling of small fruit, and also, possibly, of establishing a cannery for working up surplus, is meeting with much favor on the part of the berry growers. The organization so far is kept within local fields, but it is hoped later that a sufficient number of these local organizations may be effected to all join together in the forming of a cannery company.

The initial step seems to be taken by the berry growers about Moneta, as we noted in these columns some weeks ago. They have now formed the Berry, Vegetable and Fruit Growers' Association of Moneta. The first officers elected are: J. H. West of Gardena, president; H. J. Harris of Moneta, vice-president; R. J. Rodgers of Moneta, secretary; and F. M. Sales of Moneta, treasurer. A committee was appointed by the meeting which elected these officers to visit other berry growing sections, and urge co-operation along the line noted above.

The late apple tree census places the number in the United States at 200,000,000.

The passing of the Oregon Short Line Railway into the hands of the San Pedro and Salt Lake Railway Company, indicates that California will soon have another outlet for its fruit and other products.

To date Riverside has shipped nearly 4600 cars of citrus fruits since November 1, 1902. May was the biggest month with 829 cars. That means two short train loads of oranges per day out of one town of California.

Another lemon curing house to handle lemons under the Teague system is now being constructed at Azusa. The building is 50 by 142, with a separate sweat house. The sides of the building are all open save for wire screening, and inside there are tents arranged to hold a car load of lemons each.

We are in receipt of a letter from the California Promotion Committee, San Francisco, stating that the efforts in the East have been fruitful of good results, and is bringing to the Coast quite a number of persons desirous of securing employment at once in the fruit harvest. The applicants thus far are chiefly stout, able-bodied young men.

Growers and others in need of this class of help can at least in part have their wants supplied from this source by sending their applications to the committee, 25 New Montgomery st., San Francisco.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

THE FARMER AND THE TRUST.

Under this caption the agricultural editor of the San Francisco Chronicle once wrote a chapter in his work on farm economics. Since that writing the editor has studiously held that cooperation as exemplified by the Southern California Fruit Exchange is but another manifestation of the trust idea. And now the editor of the San Francisco paper includes the California Citrus Union in the trust category, much in violation of the Cultivator's ideas of what constitutes a trust. Taking as a text a letter written by a Highland citrus grower, or a commission man anxious to again insert his crooked finger into the pie, the Chronicle reiterates that these co-operative associations are trusts. In order to set this matter clearly before the multitude who read the Cultivator we propose to give a succinct definition of "trust" in its specific meaning. It is an organization for the control of several corporations under one direction, by the device of a transfer by the stockholders in each corporation of at least a majority of the stock, to a central committee, the object being to enable the trustees to elect directors in all the corporations to control and suspend at pleasure the work of any, limit production, and thus to defeat competition.

Now let us examine honestly how the Exchange or the Citrus Union fit into this plain definition of a trust. These two organizations have no relation with each other, save in uniting to maintain a common selling agency known as the California Fruit Agency. This fruit agency is what the Chronicle now denominates a trust. It has no control whatever over the stock of the associations using this selling convenience. The Board of Directors of the agency have no power to elect officers of the associations or interfere whatever in the growing and packing of the fruit they are to sell. They cannot suspend anything at pleasure or limit production or do anything against public policy. The trust holds individual interest as subservient to common authority for the common interests of all; the only subserviency in the agency plan is where the individual grower has turned his fruit over to be marketed at cost or for a stipend clearly agreed upon in advance. The trust, if necessary, limits production and fixes prices; the agency does not and cannot limit the output of citrus products, nor does it fix prices. It may fix the asking price, but the selling price is fixed by the natural laws of supply and demand—of barter and trade in open market, often in auction market. Who ever heard of the Standard Oil Company's offering its goods at auction, or indeed giving its customers anything whatever to say about prices. Again, in commodities handled by a trust the retail price is usually fixed as well as that of the wholesale. And here is a little peculiarity about citrus fruit prices. The retail rates of oranges are more steady than carload rates. When the retailer can buy low his profits are high, sometimes inordinate. When he pays a good price he may approximate his usual percentage of gain by shading up a little . But in any event the eastern consumer is a little the gainer whether carload lots sell high or low. The agency does not try to interfere with the retailers' business and thus we have another difference between the trust and legitimate co-operation.

The moving cause of the uniting of all the citrus fruit interests in one selling agency is the cause of proper distribution and not of stifling competition. The retailer must not have more than the fair profits justified by his risk of final ownership as a dealer, and the only way to prevent his getting more than his share is to distribute the fruit so widely among the markets that the retailer will have to share his margins with the grower and the consumer pay but a fair price. The vital part of the agency plan is the policy of giving everybody a chance to buy citrus fruits and nobody the alternative of doing without because of

congested markets here and emptiness there.

Trusts thrive upon special privileges, the privilege of buying their labor at the trust's price and selling its products at the trust's price. The fruit agency has not special privileges, not even of lower freight rates upon its 15,000 or 20,000 carloads, than the independent shipper has on one. Imagine the great monopolies ever having been able to build up their immense business by choking competition, without the aid of railroad rebates and other unfair advantages over the individual. But this argument could be continued without limit and examples supplied ad infinitum, were it necessary.

Leaving the trust question for the present we refer again to the Highland letter in fairness to the Chronicle speaking of the statement that 500 acres at Highland will unite to build a packing house to sell independently of the agency. The Chronicle says: "These growers have simply been stirred up and fooled by the commission men who want to get their fruit. Nobody can help them." Last week the Cultivator attempted to show these alleged independent growers that their actions were but inviting a rehabitation of the commission system. We do not fear that the hard-headed business fellows who are engaged in citrus fruit production will go very far away from each other, and that those who deliver themselves to the commission merchant will be few and far between. Dante says he saw upon the gates of the Inferno, "He who enters here leaves hope behind." What an appropriate motto for those independent growers who wish to sell in competition against the co-operators and bring back the state of affairs that drove the Exchange and Citrus Union into consolidation of selling agencies.

LETTUCE FOR SILKWORMS.

Editor Cultivator: In your issue of July 3rd appears a brief, but very misleading article conveying the thought that lettuce can be utilized as a food for silk worms. On a business basis it never can. It is a well known fact that in some measure the leaf of the lettuce contains the same elements as that of the mulberry, but there is not the same combination of other elements so essential to the food of the silk worm. There is too little of the fibrous, and too much of the watery substance. This fact renders the leaf unable to resist the influence of the atmosphere for any length of time and so it wilts very soon when taken from the main stem. Even when left on the stem if it be taken from the ground the same is true. To think of turning a brood of silk worms out into a lettuce bed to feed themselves, is a most preposterous idea. Don't try it. The Bambes Moir silk worm is so constituted by nature that it will not prey upon any other insect but almost every other insect will prey upon it. Another peculiarity of its constitution is that either dust of any kind, excessive dampness as mouldy, decaying matter will make it sick, sometimes fatally. Lettuce leaves are therefore not the proper food, as taken from the root they will too soon decay on the trays. If the worms are put out doors to feed on them they would be almost immediately devoured by ants and other insects.

The mulberry tree is made for the silk worm, and the silk worm is most perfectly adapted to the mulberry tree. And still more Southern California is the Eden of one and the Paradise of the other.

This state is destined to be the great silk producing region of the whole earth. If only the people will awake to this great industry we might within the next decade be sending out millions of dollars worth of eggs to all the leading silk growing countries of the world, besides saving to our own bread winners the $45,000,000 that is now sent out for reeled silk to supply our nine hundred silk factories.—Mrs. Carrie Williams, San Diego, Cal.

Ed. Cultivator: What shall I use to rid my hogs of lice?—G. A. M., Burbank.

Apply with sponge weak solution of creoline and water—creoline one part, water 100 parts. This is recommended as one of the very best of remedies.

There is now a telegraph wire encircling the earth.

Coast News and Notes

By R. A. Dague, 1045 Regent St., Alameda

The hog cholera is alarming in the vicinity of Sacramento.

There are now 87,000 Japanese in California and they are still pouring in.

A new and large fruit packing house is nearly completed at Red Bluff.

The banner sale of a carload of California cherries this year in Boston was for $3726.

For some time San Leandro shipped two car loads of cherries daily to San Francisco.

Napa county seems to be very prosperous this year. Both the fruit and grain crops are good.

Fourth of July firecrackers caused a fire in Wheatland that destroyed property to the amount of $250,000.

The Pacific cable is now finished, connecting San Francisco with Honolulu and the Philippine islands.

It is estimated that the late high winds damaged the hop crop of Yolo, Sacramento and Yuba counties to the amount of $100,000.

The Haywards cannery has so far canned 25,000 cases of cherries, the varieties being mainly Black Tartarians and Royal Annes.

The dropping of oranges along the Tule river and in the vicinity of Visalia causes considerable anxiety on the part of fruit growers.

The canneries of Dixon have been running for some time with a large force and have turned out a large amount of canned goods.

On July 11th the Earl Fruit Company shipped from Sacramento to London eight car loads of assorted fruits, mainly plums, prunes and Bartlett pears.

Cutting and drying of apricots and peaches is in full blast at Bakersfield. Notwithstanding early discouraging reports the fruit is good and the yield heavy.

Fruit in the Sacramento valley is ripening rapidly. Three steamers make daily trips carrying the fruit to San Francisco. They each handle about 95 tons daily.

Careful estimates have been made of the apricot crop of La Habra valley. It is placed at 125 tons, which is larger than any former crop. The fruit will be dried.

At the weekly produce sale at Santa Rosa last week 55 cases of eggs were offered. The owners were offered 20 2-3 cents but they were held for a higher price.

The premium list of the coming state fair has not yet been published, but it is definitely stated that the committee has decided to offer $1000 in premiums for the best county exhibit.

One rancher at Visalia has 390 orange trees of the Valencia kind. Last year they yielded 2121 boxes of fruit. Adjoining him is another orchard of 1100 trees that yielded 5000 boxes.

It is now given out that careful estimates of the wheat crop in the Northwest are: Washington, 20,500,000 bushels; Oregon, 11,500,000; Idaho, 4,000,000; total of the three states, 36,000,000.

The wine grape business in the vicinity of Lodi will receive a big impetus from the fact that a large winery plant is being erected by Geo. West & Son at that place. It is in process of construction.

A restraining order has been applied for in Judge Morrow's court by U. S. Attorney Banning to prevent the owners of 200,000 sheep from pasturing their stock on forest reserve land in Stanislaus county.

It has been decided by the Southern Pacific railway to cut a tunnel through the San Luis Obispo mountains. When it is finished two hours will be saved on the Coast Line between Los Angeles and San Francisco.

The Sutter almond growers have held a large mass meeting and formed an Almond Growers' Association. The officers are B. F. Walton, president; L. H. Woodworth, vice-president; and H. C. Clark, secretary. Their next meeting will be on July 20th. They propose to receive sealed bids for their joint crop.

It is now stated that in many instances typhoid fever is caused by the use of impure milk. The Board of Health has sworn out thirteen warrants against San Francisco milk men and proprietors of restaurants.

Up to July 7th there had been shipped to eastern markets 1100 car loads of fruit from Sacramento. The fruit was mainly peaches, apricots, plums and pears. This is 300 carloads more fruit than shipped last year at the same date.

The following special report has been received from Smyrna as to the raisin crop there: Prospects for 1903: Sultana raisins, 39,000 tons; black raisins, 18,000 tons; red raisins, 11,000 tons. Crop of 1902: Sultana raisins, 33,000 tons; black raisins, 15,500 tons; red raisins, 10,000 tons.

Some time ago J. B. Haggin of the Sacramento breeding farm, sold three horses. They went east and at the late races at Sheepshead Bay won a sack of money. Mr. Haggin received as breeder $900, and the owner of the three-year-olds took down $18,435. The California race horses are becoming famous.

Since the boycott against the Growers' Co-operative Agency at Wheatland the commission houses of San Francisco have sent their fruit buyers into that section and the locality is filled by them. All crops look fairly well there except Bartlett pears. The late strong winds knocked off half of that crop.

The Horticultural Commission of Lassen county says the San Jose scale was so bad in that county has been almost eradicated by the use of a solution of salt, sulphur and lime; that wooly aphis is easily destroyed by uncovering the roots of the trees early in the spring and sprinkling them with pulverized bluestone.

The berry business in the Pajaro valley still continues to make a fine showing. The day previous to this writing the shipments were: Vega, 665 chests of all varieties of berries; Watsonville, 229 chests of strawberries and 119 chests of Logan berries; Aromas, 320 chests of all varieties; Pajaro, 125 chests of all kinds.

Professors A. J. Turner, representing the United States, and J. N. Leconte, of the State University, representing California, have commenced to investigate the irrigation proposition in this state. It now looks like the reclamation of arid California lands is to be seriously undertaken by Uncle Sam and California, acting jointly.

The fruit growers of the Campbell district, Santa Clara county, held a called meeting a few days ago to discuss the late decline in the price of apricots. After a thorough canvass of the situation they decided that $45 per ton would be a fair price. The crop in this district is not a large one, but the fruit is of good quality.

One and two years ago large consignments of almonds were shipped from Chico to Portland, Oregon. The Portland house that handled them have sent their agent to Chico to buy this year's crop, saying they were the best they ever saw. Mr. Bane, living near Chico, estimates his crop of almonds this year at fifteen tons.

The Porter Brothers Company expects to resume business soon. The company owes in this state $646,000 and claims to have assets of $675,000. The following banks are among the creditors of the firm: American National, $50,000; San Francisco National, $150,000; London, Paris and San Francisco, $50,000; Anglo-Californian, $100,000; Wells-Fargo & Co., $100,000; Farmers' National of Fresno, $40,000.

The failure of Eppinger Brothers demoralized the grain market in Central California. Not more than one-tenth of the usual business is being done. Grain, instead of being shipped to the warehouses at tidewater, is being stored at interior points. The bankers are trying to re-organizze the business on a sound basis, hoping to revive the business.

The American Fish Company are catching a great many salmon in the Sacramento river. The catch is all sold in Germany. Last year the shipments of salmon to that country aggregated 8000 tierces of 700 pounds each. Salmon are very plentiful this year both in the Sacramento river and Monterey bay. Two hundred boats are busy catching salmon in the latter waters.

Michigan this year leads California in sugar manufacture. For thirty years California led all others. Professor G. W. Shaw, of the University, says the reason why we have fallen behind is the farmers did not irrigate their beets, fearing the effect of water on the quality of the beet, although irrigation of the beet was successful in Utah and Colorado. "It has been proven," he says, "that while the percentage of sugar is lowered by irrigation, the crop was increased 50 per cent."

For some time the United States Department of Agriculture has been experimenting in various sections of California in raising Gluten wheat. These experiments have been successful, so much so that the Agricultural Department of the State University will experiment on a large scale. The plan is to experiment on the co-operative plan—that is, to take pretty large tracts in different part of the state and try to grow the wheat in large quantities. This is for the purpose of inducing the ranchers all over California to plant Gluten wheat only.

Any one that is interested in the Smyrna Fig business should know what variety of Capri to plant. Now is the time to determine. Send 25c to cover packing and postage to W. Herbert Samson, Corning, Cal., proprietor of Maywood Colony Nursery, and he will send you by mail four of the Capri Figs of different varieties, containing the Blastophaga. The figs contain three to eight hundred insects.

Persons wanting larger quantities can obtain the figs for $5 per 100. Mr. Samson has made a study of this business for the past three years, and has proven that he has the best variety of Capri fig in the state.

ECHO GLEN JERSEY HERD

Is sold, except a few for family use; and Echo Glen Place is platted out for sale. A suitable place and manager is greatly desired to establish another herd. Those having for sale desirable land, easy of access, not large place, with or without improvements, should write. A man with or without a ranch who knows how to keep fine stock will please write, A. B. WHITE, 2547 W. Twelfth St., Los Angeles.

CITRUS TREES

That will grow, bear profitable crops, and are true to name, are the only kind that we propagate. Thirteen years in the citrus nursery business — hence know the wants of citrus planters. Sumptuously illustrated catalogue on citrus culture *free;* send for a copy.

SAN DIMAS CITRUS NURSERIES

INSURANCE AT COST

We are furnishing Insurance to the farmers of Los Angeles county that is

Safe, Sound and Conservative

Over 2,000 farm buildings in this county are covered by policies in our company, at a cost, during the past four years of only 5 cents per hundred dollars per year. Why pay big salaaies and dividends to eastern officers and stockholders? Before your present policy expires drop us a postal card and we will send you full information of the mutual plan.

LOS ANGELES COUNTY FARMERS MUTUAL FIRE ASS'N
Chartered by the State
G. F. CROMER, Secy.
207 Currier Bldg. Los Angeles, Cal.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so faras possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS (CONTINUED).

We have become quite familiar with the great branch of Phylum Arthropoda—jointed animals with jointed legs. We have taken a glance at the lowest class, Crustacea with its great crabs and lobsters and the familiar sow-bugs; we have studied somewhat the Myriapoda with its centipeds and millipeds; we have also taken a brief survey of the great spider class—Arachnida. These are the eight-legged animals and included the wee mites with their big brothers, the ticks, the forbidding scorpion, and lastly the spider order. None of these are insects, so as yet we have not had anything to say of entomology. Among these that we have already discussed only a few are pests. The sow-bug sometimes eats seeds and so vexes the gardner. The millipeds sometimes eat plants, though as yet have never been a serious enemy of the orchardist or gardner in this country. The mites are the only serious pests in all these three classes and these as we have seen, trouble not only the fruit grower and gardner, but are often a serious pest in the poultry yard and even vex not a little the higher animals, not excepting man himself. The ticks, which as we have seen are colossal mites not only vex the domestic animals, but as we have seen, are purveyors of the dreaded Texas fever, which so often spread mortality among cattle to an alarming extent.

* * *

INSECTS. We now come to entomology proper. The insect class is also well named Hexapoda, as all insects when mature have six legs. The insects are also peculiar in having three well marked portions if the body, head, thorax and abdomen. They always have antennae, though sometimes these organs are very short and obscure. When mature they always have large compound eyes. Many also have in addition simple eyes, one, two and three in number. Insects also go through quite marked transformations. True, we have seen that the mites go through transformations in that when they hatch they have only six legs but after the first moult they have eight. The Myriapods also pass through somewhat similar transformations, while some of the Crustacea change not a little when they reach maturity. The crab looks at first much like a shrimp; it later resembles more the lobster, and finally the abdomen becomes abbreviated and we have the mature form—the crab.

In insects, however, we have the metamorphoses much more emphasized. When the insect first hatches it is quite different, usually from the mature form.

In some insects we say the transformation are complete, in which case the young, just from the eggs look much like mature form, though they are entirely wingless. In this stage they are known as larvae. Later, they have stubs of wings, or short wings, which as yet are functionally usless. They still look like the last stage, known as the Imavae. We now call them pupae. In the last stage, known as the Imago, they have their fully developed wings, and their reproductive organs are now for the first time fully developed. These are well named insects with incomplete metamorphoses, for in all cases they would be recognized as belonging to each other or as the same insect. In all these, both larvae and pupae are also known as nymphs. Insects with incomplete transformations have like habits from first to last, that is, they all take food and feed upon the same kind of material. Bugs, locusts and dragon flies are good illustrations of insects of incomplete transformations.

Insects with complete transformations are quite different from the above. Here the forms of the larvae, pupae and imago are quite different. The larvae are usually worm-like, or cylindrical and are familiar to us all in grubs, maggots and caterpillars. I say they are worm-like; this accounts for the fact that they are usually called worms as I have alreary seen, worms as we have already seen, ferent branch of animals, never have two legs, and never nave really true breathing organs. We see, then, that it is never proper to use the word worms in discussing insects in any of their stages. True, in common parlance we speak of army worm, cut worm, etc., but as these are no worms at all, but rather the larvae of insects, the word is quite wrongly used. The larvae of this group of insects may or may not have legs. The larvae of beetles usually have six legs and are called grubs, though in some cases they are footless, or apodus, as we call them, the word meaning without feet; this is true of all the larvae of weevils, or snout beetles. Fuller's rose bettle, so troublesome in our orange orchards, is a good example of this last. The larvae of all Diptera, or two-winged fly, are also like the weevils in being footless. We call these maggots. The larvae of moths and butterflies are usually known as caterpillars. The most of them have sixteen legs, though the loopers or measuring worms usually have only ten legs. A few, however, have twelve or fourteen: Some of the noctuid moths—the pre-eminently night-flying moths—as caterpillars, have twelve or fourteen legs at first, and after one or more moultings may have the usual sixteen. It is interesting to note that these various larvae may be thickly covered with hairs, which are often long and thread-like, or may be heavy or spinous. These are evidently for protection. The bird likes not the hairs and so lets the caterpillar severely alone. Often these caterpillars have a very unsavory odor and presumably have an equally forbidding taste. These do not need the hairs, for they are protected in their ill-flavor, and so are left unmolested by birds or other insect feeding animals. Insects that are in the ground most of the time, as larvae are usually without either of the above characteristics, as they are protected in their underground home. It is needless to say that caterpillars are voracious feeders and their gormandizing habit acounts for their rapid growth. Growth and food-taking here is largely, often entirely, confined to the larvae. Most of these larvae have good jaws and so eat up leaf of plant or other insect, as the case may be. The maggots have very different mouth organs. They have a sort of a hook which they can draw back and forth and thus wound the plant or animal creature on which they feed, after which they can suck or absorb the juice. The larvae of the highest order of insects which includes the bees, wasps, ants, etc., are for the most part cared for by their parents. Some of these have almost no mouth organs at all, and are, like the larvae of bees, bathed in a liquid food which they can absorb throughout their entire bodies.

The second stage of this group of insect, those with complete transformations, is called pupa.

Here the insect is almost entirely quiet and takes no food. It it is to become a butterfly we call it a chrysalis. These pupa are often included in a cocoon. The cocoon may be of silk, as with many moths, may be earthen, as in case of cut worms, caterpillars, or may be of sawdust, as in case of the borers. This cocoon simply serves as a protection and is formed by the larvae just before it becomes a pupa. The form of the pupa is quite different from either that of the larvae or imago. The word means trussed or bandaged and is not inappropriate, as the pupa is really quite like the imago with its legs and wings and mouth organs wrapped about with a membrane which holds them close to the body. This pupa, then is an intermediate stage between larva and imago. The wings and legs of the imago are present, but are bound close to the body and so are useless.

The imago is a full formed adult insect. It has the six good legs for walking, usually wings for flight, and now has fully developed reproductive organs. The larvae usually live a few days or possibly weeks, or, is case they pass the winter as larvae, for a few months. The imagos usually live but a few days, though they may pass the winter as imago and in a few cases like bees and wasps, the mother may live for years. While most insects do all their feeding while larvae, a few, like some of the beetles, feed ravenously while imago. The potato beetle is a good illustration of this. Insects generally pass the winter either as egg or pupa, though a few pass the winter as larvae. Quite a large number of insects live as imago through the cold months of the year.

We remarked above that the insects are composed of head, thorax and abdomen. The head bears the eyes, antennae, and mouth organs. Within the head, of course, is the brain, which in case of bees and ants is quite large and even marked with convolutions. The thorax is the second part of the body and bears the legs and wings. It is made up of three rings, one for each pair of legs. The wings, in case there are but two, are borne by the middle ring, while if there are four, they are attached to the middle and hinder ring. Within the thorax is little but muscle, as the great muscles that move the legs and wings are in this part of the body. Of course, the aesophagus passes through the thorax and on the under side are usually two large nerve masses. The third part of the body is known as the abdomen. This, of course, is important in containing the important internal organs, as most of the digestive tract, the reproductive organs, etc.

(To be continued.)

* * *

WHEN TO BUD.

Subscriber from Covina asks if it would be advisable to bud oranges and lemons as late in the season as July. He has trees he wishes to bud, desires to put it on it it would be better to do so. It is not common to bud citrus trees as late in the season as this. Early in the spring while the sap is moving freely and the growth of tissue rapid just beneath the bark, the bark will loosen easily from the wood, and at that time budding is more apt to be successful. I think if I wished to bud my trees and had not already done as I should think it wiser to wait until next year. Early budding gives a good growth before fall. I hope some of the budders will give their experience, as I have had several inquiries in regard to the matter.

* * *

LEGISLATION.

The subject of legislation will come up at the seaside institute at Long Beach. One of the topics that will be considered will be the present law protecting the dove. Many think it would be wise to limit the season for shooting to two months, while others think they should be exempt entirely from the ravages of the sportsman. There can be no question but that the dove does a great deal of good. It is true that they live largely upon grain and seeds and will take the cereal to some extent, but his food for most part and for a large part of the year consists almost wholly of weed seeds. Seven thousand of these have been taken from the stomach of a single bird at one time. This shows how valuable they are in aiding us to protect against these ugly and disturbing blots upon the landscape. My own opinion is that these are very valuable birds and that they are in danger of extermination. I am quite of the opinion that it would be the part of wisdom to pass a law making it an offense to kill these birds at any time of the year.

GOOD ROADS.

I doubt if any part of California has made more rapid strides in the way of road improving in proportion to the population than we have at Claremont. We raise by way of private subscription about one thousand dollars per year which is duplicated by the supervisors. As a result our roads are fast becoming a delight to all who have occasion to use them. I have never yet heard anybody regret money appropriated for this purpose. It not only adds greatly to our comfort but certainly raises the value of our ranches not a little. This subject of roads and road legislation will certainly come before the seaside institute. It is to be hoped that suggestions as to needed legislation and general improvements of our roads and road-making will come up for consideration. There is certainly one thing that needs attention, perhaps as much as anything in California, and that is the looks of our highways. The great show of weeds along all our roadsides is a disfigurement which good taste cannot and should not allow to continue. Besides, those weeds are a menace to those places that are kept in good order as the seeds from the weeds are widely distributed and so it makes it much more difficult to keep our places tidy and in good order. The matter of roadside tree planting is also one of great importance. How grateful and beautiful too is the shade from peppers and eucalyptus which frequently greets us on these hot days as we are driving through the country. True, it is difficult with so many vacant places to secure success in this roadside tree planting. However the pepper will live and do fairly well if we see to it the first year, and secure a good growth. I know of peppers that have not received any attention from the first year of planting, and they have done very well. The same is true of the Eucalypti. If we give them attention until they get well rooted they will then grow on and not only give shade and beauty, but will add greatly to the value of our ranches. Can we not afford to give attention to this matter and secure the one thing needed to make our California landscape unsurpassed anywhere in the world? In planning for roadside tree planting, there are three or four trees that may well be considerd. Eucalyptus viminalis, E. sideroxylon, E. rostrata, or even E. globulous, will all do well and give satisfaction. Acacia melanoxylon and Sterculia diversicolia, are exceedingly beautiful and very desirable for planting along our highways. This matter cannot be too frequently or too urgently pressed upon the attention of our people.

* * *

DRAINING FOR ALKALI.

M. W. Messenger, Phoenix, Ariz., is interested in the subject of alkali, as mentioned in the Cultivator of July 3rd. He wishes to know just what I mean by good underdrainage in connection with ample irrigation to overcome the evil of alkali in the soil. The principle involved is this: All the water that we add to the soil dissolves a little of the alkali. If this filters through the soil and runs of, it carries the alkali away and so cleanses the soil. If, on the other hand, the water evaporates, it collects and brings the alkali to the surface, just where it is most harmful. What we wish then, to do, is to secure such a condition that the water will run down and pass off, carrying with it the alkali. If there is free drainage, the more water the better. If, on the other hand, there is not free drainage, any surplus water is very mischievous. We must remember that our alkali soils are alkaline because there has not been free drainage. Of course, this free drainage could be secured by use of drain tile, but this is very expensive. In some parts of Orange county, great benefit has come from open ditches, giving a chance for the water to pass off. Mr. Hazzard, of Westminster, has reclaim some very strong alkali land in this way.

* * *

FOUL AND BLACK BROOD.

A very interesting bulletin has been issued by the department of agriculture of New York, giving researches by Dr. V. A. Moore, the same excellent authority that is to be with us at Long Beach. Dr. Moore has reared in culture tubes the Bacilli of both black

and foul brood. He decides that they are the same, only modified by circumstance. I think some of our best practical men have come to the same conclusion. I find that even undoubted foul brood varies not a little. The odor and the nature of the putrescent matter is quite different at times. Even the difference of black brood is only a little more marked.

* * *

DISTILLATE SPRAY FOR RED SCALE.

Horticultural Commissioner Geo. R. Holbrook wishes to know if distillate spray will kill red scale. A few trees in his district are infested and are too large for fumigation with any tents at command. He asks if distillate spray will surely effect to kill these pests.

The red and purple scales are of the armored group. Here the scale is not the insect, but a protection. It aids to shield the insect which is under it, and so these armored scales are rather difficult to kill. Again, though the purple scale lays eggs, the red scale never does. In this case the scale are born alive. Thus in case of red scale there are always old and young. This is why the red scale are the most to be dreaded of any of our scale pests. They are always, of all ages, armored. With either distillate spray or fumigation it is very hard to kill the old scale. Thus it is usually necessary to spray or fumigate twice to do effective work. I think spraying twice with a two per cent distillate spray at an interval of five or six weeks can be counted on to kill all red scale. As distillate spray can be used three times at no greater expense than attends one fumigation, we see that in distillate spray we have what Mr. Allen says is one of the greatest boons that has come to our citrus orchardists. Let all remember that our orchards should only be sprayed or fumigated when in full vigor. So we should irrigate and cultivate well before we treat the tree for scale.

California Horticulturally...

John Isaac, Sacramento

TO INVESTIGATE THE WORK OF PARASITES.

Alexander Craw, Deputy Horticultural Commissioner, will visit the Southern counties during the present week, for the purpose of meeting with the different county horticultural commissioners and considering the best methods of protecting this section from pests with the introduction of which it may be threatened. Within the past three years Mr. Craw has distributed over the southern counties a great many colonies of beneficial insects, and during his visit he will visit the different sections in which these have been established with a view to ascertaining to what extent they have taken hold and spread, and, further, of deciding to what extent they may be relied upon in the future for overcoming the pest they have been introduced to work upon. From reports received by him, it would seem that the Scutellista cyanea—the South African fly imported for the black scale—is doing good work in some parts, although reports are not so favorable in others. The red scale, which has been so severe a pest to our orange growers for years is also reported as decreasing in some parts under the influence of a little golden chalcid fly which is fast increasing. Mr. Craw's investigations during this month will prove what the parasites are doing, what is to be hoped for from them and his report will be anxiously looked for.

* * *

HONESTY IN FRUIT PACKING.

While policy may not be a very high plane upon which to base honesty, the old adage about honesty being the best policy is nevertheless a true one. This is especially the case in the handling of any form of food products and yet it is one which we cannot realize the importance of sufficiently to punish violators of it. As the Senate committee, appointed to investigate into the adulteration of foods, put it in their report: "Counterfeit goods which are traded for honest dollars should be placed under the same ban as counterfeit dollars traded for honest goods." California fruit is a great sufferer from this species of dishonesty, and there is little question that our markets could be very widely extended if the purchaser of our canned and dried fruit was sure he was getting for his money what he paid for, and even in the case of fresh fruits, that the whole box was equal to the layer exposed to his view. The truth of this was brought forcibly to mind in conversation with a leading fruit grower who has just returned from Europe. While in France he met a prominent grower who was condemning California canned fruits as being utterly worthless and unsalable, and he became very excited in his denunciation of our goods. To establish the justice of his indignation he took from his shelves a can labeled as Superior California fruit and opened it, turning out its contents for our California friend's inspection, "and," to use the gentleman's own words, "it was a lot of slush, fit for nothing but hog feed." While such packing is possible and while such stuff is put upon the market the fruit industry of California, and especially the honest packer, will suffer. It is true that the packers of such stuff are very careful that their names do not appear in connection with it, and it is put up under some gaudy title, with an attractive label as first class California fruit. It would not be possible for the unfortunate purchaser to discover who packed it, and as California fruit it is condemned, together with all California fruit of which it is assumed, by those who are not otherwise informed, to be a fair representation. To widen our markets, we must sell honest fruit and, to do this, there should be some way to prevent dishonest packers from trading on California's good reputation and trailing it in the mire.

* * *

DAMAGING WIND.

Unusual and very severe north winds, the first of the month, have materially changed the fruit prospects in the lower Sacramento valley. The damage has certainly been very heavy. Ripe and half ripe fruit was blown from the trees in large quantities, and farmers estimate their loss from one-third to one-half the crop. Along the Sacramento River, Bartlett pears have suffered severely, the damage not being confined to the fruit blown from the trees, but extending to that which remains, which has been badly bruised. How extensive this damage is will not be known until the fruit is ripened. In the wheat fields, ripened grain has been badly whipped out, while the hop yards have also suffered and many acres of poled hops have been leveled. Altogether it has been one of the most disastrous wind storms this section has ever experienced.

* * *

MANUFACTURING MARASCHINO CHERRIES.

Every passing year sees some new fruit product added to California's exports, and her markets gradually widening. It is quite recently that we have become shippers of Smyrna figs, but already the industry has become established on a commercial basis. Now one of the large preserving firms of San Francisco is putting up for the first time Maraschino cherries in large quantities. This is a very fine quality of preserves which have heretofore been imported from France and Italy. The firm which is making a specialty of this fruit imported an expert from France to take charge of the work, and contracted for the finest cherries they could procure in Alameda county. Wm. Barry, of Niles, furnished six tons for which he received $110 per ton. These were all Queen Anns, and had to be picked with the greatest care and to be perfectly ripe. Mr. Barry picked his trees four times, selecting each time only the perfect fruit. The preserved cherries are put up in clear glass bottles, with handsome labels, and present a very attractive appearance. A market for them is found in all the large Eastern cities, where they are extensively used in bar rooms in the manufacture of fancy drinks.

Yolo County is to have another big irrigating system. The Yolo-Solano Irrigating Company has been organized with the capital stock of $5,000,000. The first directors are: Willard M. Shelden and C. M. Wooster of San Francisco and Messrs. H. S. Joslyn, Edward Huston, W. P. Craig, J. I. McConnell and F. A. Porter of Woodland.

CAMPING PRIVILEGES AT SEASIDE INSTITUTE.

A letter from D. L. Davenport of the committee on camping place informs us that Mr. Bixby has granted free camping privileges to attendants at the Seaside Institute. The plot donated is on the ocean front just off the electric line near Alamitos. Tenting privileges and water both free.

The sessions will begin Monday, the 27th, and all should be on hand for the first session.

Cocoanut Oil Cake

THE BEST
Feed for Stock
Chickens and Pigs

For sale in lots to suit. By

El Dorado Linseed Oil Works Co.

208 California St., San Francisco, Cal.
HENRY ALBERS, Agent, Los Angeles

Scott's Wax A SURE CURE FOR **Gum Disease**

Made after the formula of Mr. John Scott, late Horticultural Commissioner, by
S. M. WOODBRIDGE, Ph. D., So. Pasadena, Cal.

DIRECTIONS—Cut away the diseased parts of the tree, allow to dry, and apply melted wax with a brush.

BEE SUPPLIES—G. G. Wickson & Co., 123 N. Main Street. Los Angeles, Cal.

The **Vernon Nursery**

We will offer 100,000 deciduous fruit trees for sale next season

If you are thinking of planting it will pay you to give us a call before placing your order

We are headquarters for all kinds of deciduous fruit trees, nuts, grapevines, berry vines and blue grass

A day spent looking over our nursery will be money well invested

A. YARNELL,
Station K, LOS ANGELES, Cal.

BROWNSBERGER HOME SCHOOL

STENOGRAPHIC BOOKKEEPING
AND CLASSICAL COLLEGE PREPARATORY DEPTS.

953-955-957 West Seventh St., Los Angeles, Cal.

Pleasant study in the midst of the most beautiful home-like surroundings. Day and evening sessions. Shorthand made easy by famous "Chalk Talks" by the Principal. Machine at home free of charge. Spanish at lowest rates. Every graduate in a position. Ten teachers. Largest capacity in the city. The Bookkeeping is the famous Budget System. Classical College Preparatory Dept. fits for State University. Send for illustrated Catalogue. FLORIDA BROWNSBERGER, Principal.

SOMETHING NEW IN PAINT

"STAY-THERE"

Is mixed with water, nature's free gift. The cost of oil is therefore saved, the appearance is improved, and the lasting qualities equal.

Your Painting Bills Reduced 50 to 75 Per Cent. If you want to paint buildings or spray your trees, see our Spray Machines before you buy.

Prices from $6.00 up. Call or write our store,
715 S. BROADWAY
and let us show you.
CHAS. J. STONEHAM & CO., PACIFIC COAST AGENTS

Largest Nursery
West of the Rocky Mountains

CALIMYRNA FIGS
(Genuine Smyrna Fig of Commerce)
The only Fig that is fit for commercial purposes. It has proven a grand success in California, and orchardists should not hesitate to plant liberal acreage. **"The Smyrna Fig at Home and Abroad,"** by Geo. C. Roeding. 87 pages illustrated, sent postpaid, 25c (stamps).

Contracts made now for delivery 1904.
Deciduous, Citrus and Ornamental Trees and Rose Bushes.
Finest and most complete Nursery Catalog published mailed for five cents postage.

RESISTANT GRAPE VINES
Sole agents in the United States for largest Nursery in France growing Resistant Grape Vines. In addition to this we are also large growers of Resistant Grape Vines ourselves. Quotations given on rooted Resistant Grape Vines, grafted to the leading varieties of table and wine Grapes. As we handle in car lots we can make very low prices.

PAID UP CAPITAL, $200,000
FANCHER CREEK NURSERIES Inc.
GEO. C. ROEDING, PRESIDENT AND MANAGER
P.O. BOX 14 FRESNO, CAL.

Tree Spray Distillate

Not an emulsion of oil and caustic soda, but a special distillation of oil from which all asphalt and other deleterious substances have been removed. Mix with water and apply with spraying apparatus that gives a thorough and constant agitation to the liquid—when properly done we guarantee that it will destroy all insect life attacking either citrus or deciduous fruit trees and not

Spot Fruit or Hurt Tree

Cheapest and Best Insecticide. We also manufacture **Gas Engine and Stove Distillate, Lubricating Oils, Etc.** We solicit your correspondence and orders.

SOUTHERN REFINING CO.
P. O. Box 9, Station C. Los Angeles, Cal.

By J. W. Mills, Ontario, Cal.

DISEASES OF DECIDUOUS NURSERY STOCK.

While we are having root knot, and growers in the East have the yellows and other things with their peach trees, the nurserymen of England have a new disease that seems to be fully as destructive. It shows on peach, plum and apple trees. It is a fungus disease known as Eutypella prunastri, and in some instances has destroyed more than 50 per cent of the trees. This disease is easily detected by those acquainted with it, the stem being the first attacked, showing a slight brownish color of the bark, which becomes dry and hard and sticks tight to the wood. There is no other outward indication during the first year, as a rule. The part of the fungus that corresponds to the roots of other plants, however, keeps at work and peneterates to the inner bark and young wood. This kills the sap wood, which shuts off the circulation and the top of the trees starve to death or dry up. Young trees might be planted by a person not acquainted with the disease and when the trees would not start to grow in the spring of the following year, the trouble might be laid to drouth or root disease. In the second year of the disease there are numerous small cracks running crosswise with the stem in the dead bark beneath the surface. There being no fractures of the bark, the casual observer would not suspect the cause of the disease. Within the minute cracks are clusters of dark spores. If the stem is broken at such places the disease is sure to be spread from those spores.

The fungus attacks many plants allied to the apple and is often found on wild plants. The chief mode of infection is through the ends of cut twigs. It is supposed that the spores are introduced into wild plants by punctures made by insects and other things. The spores mature from February to April and it is recommended that all pruning be done before that time.

* * *

GUM DISEASE.

A faint light has been thrown on the cause of gum disease of stone fruits. A German experimentor has discovered that Claster osporum, a species of fungus, is intimately connected with the gum disease of stone fruits and in all cases of experiments in inoculation, the conclusion was drawn that the gumming was caused by this fungus. It has always been surmised by scientific men in horticulture that gumming was caused by some form of disease that is traceable to a germ, but there has been no proof of it. It was not many years ago that "curl leaf" was a mysterious disease, but it is now well understood and is successfully combated. This is, however, a trifling malady compared with some forms of gum disease and root knot. It is simply the difference between losing a crop of leaves and fruit through neglect, and losing part of the root system or the whole tree.

* * *

TWO NEW RASPBERRY DISEASES

The New York station has issued a bulletin on two new diseases of the raspberry that may in time affect California growers. It is at least well to be on the outlook for them.

One is known as the "cane blight" of the raspbery and is most noticeable during the ripening season. It often kills the tops of the canes just as the berries are ripening. The fruit and leaves will wilt and dry up in a few days. The disease comes from the attacks of a fungus that grows under the bark, causing it to turn brown and die. Only a part of the stem may be affected, in which case it may be confined to a strip on one side or it may be completely girdled, killing the part above and leaving that below the girdle healthy and vigorous. A cane may be apparently healthy, with a vigorous top, but partly girdled, when the disease will quickly girdle the stem, when it dies suddenly. This is generally the case with the Cuthbert. It has gained the reputation of "running out" in some sections when the cause has been traced directly to this disease. The Columbian is said to be almost totally resistant to the disease and is taking the place of Cuthbert in some sections as a red canning variety.

The spores that cause the trouble form in black patches on the bark where the cane dies. The disease is spread in a number of ways. Split crotches, dead stubs left by pruning, rubbing of cross branches and punctures made by insects make places for the disease to enter. It is supposed that the spores are scattered by nursery stock, winds, hard rains, birds and insects, pickers when gathering the fruit, cutting out old canes and allowing old pruning to lie around, as these are prolific sources of the disease, it being known that the fungus grows on dead and rotting wood.

One season's spraying with Bordeaux mixture did not seem to have any effect on it. Three summer sprayings did not make any diminution in the amount of disease over part of the patch not sprayed. The best method of securing clean plantations of raspberries is to plant on ground that has not been put to that use for a few years, and securing plants from nurserymen who can guarantee them to be free from disease.

Raspberry Yellows is a disease that affects that fruit in much the same way that peach trees are affected with "yellows." There is no known cause or remedy for it. The disease soon renders the plants worthless. Fertilizers do not seem to help the plants any. California growers cannot be too careful in importing berry plants from the East and we hope this information given by the New York station will prove of benefit to us.

* * *

DROPPING OF GRAPES.

The so-called disease of grapes known as coulure is little understood, some varieties being very subject to it in one location and in another not far removed, it does very little damage. This is particularly true of Muscat in the southern part of the state.

It has been fully demonstrated that certain varieties of plums and almonds, besides numerous other fruits, need cross pollination in order to secure good crops. There are numerous reasons why a large number of blossoms fall without producing fruit. Aside from weather conditions, the two chief reasons are perhaps due to improper pollination and imperfect organs of the flowers. Recent investigations have shown that grapes are often possessed of infertile pollen and cannot fertilize their own flowers and as a consequence drop a large part of their fruit. Going entirely on theory it may be that if Muscats which do not produce good bunches of grapes had some variety near them which produced an abundance of fertile pollen, this trouble would be largely overcome.

It has been found that fertile and non-fertile pollen of grapes can be readily distinguished by the aid of the microscope. Fertile pollen grains are covered with a sticky substance and stick together in lumps, while the nonfetrile sorts are dry and arrange themselves on glass just as a handful of wheat would if thrown on the floor. Besides this feature, there is a difference in the shape of the pollen grains of the self sterile and self-fertile sorts. These peculiarities obviate the necssity of long and expensive field experiments in determining which varieties are self-fertile or otherwise. We can see where much time and labor can be saved even with a small number of vines in the home vineyard. For instance, in localities where the Muscat will not set a crop of grapes, pollen could be sent to some person who has a microscope, and if the pollen grapes did not prove to be self-fertile, it would be easy to determine if some other variety does produce pollen that is self-fertile in the same locality. It often happens that the pollen from some varieties has no affinity for the pistils of others and of course will not fertilize the grapes. This condition can only be determined by experimenting.

It has been determined that girdling the canes which bear the clusters tends to make the vines more productive. This might do for a few backyard vines but would hardly be practical in a large vineyard. Bending the canes has the same influence, only to a less extent and is the more practical of the two methods.

Muscats are always pruned short in commercial vineyards, but there is no reason for doing so when grown in the back yard for home use; better train them over an arbor or on the fence or on wires. If they drop their grapes then, try making sharp bends in the canes when training after pruning.

It is also noticed that the largest percentage of grapes set on individual bunches during the height of the blooming period while at each end of the blosoming time, the fewest number of grapes set. This would suggest to us that varieties that come into full bloom at the beginning and at the end of the blooming periods of self-sterile varieties, should be selected so as to have an abundance of bloom during the blossoming period of the latter. There are a great many things to learn in grape culture that most of us do not dream of now; it is only by careful thought and investigation that these difficulties are unraveled.

* * *

SWEATING APPLES.

It has been determined by careful experiments that apples which are to be used for cider making can be much improved by sweating them. This can be done by keeping them in a tight compartment. It was found that when sweated for 23 days, they reached their highest quality and at the end of 49 days, they had degenerated to a considerable extent. The cider made from apples which had been treated in this manner was much superior to that made from apples that were taken directly from the trees and ground up. The experimenter does not state if the extra trouble and expense of sweating was compensated for by the extra price obtained for the article. This is a point to be settled before the process can be recommended.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE CAL.

CALIFORNIAN ASTERS.

Our state contains about twenty species of wild aster, though in the United States there are some two hundred species out of a total of three hundred for the whole world. Our climate in general is rather warm, for as a rule, asters prefer cooler and damper climes, yet strange to say, our handsomest species grows upon the desert sides in rocky soil.

Another very handsome species, known as Anderson's Aster, grows in the Sierras northward and is but sparingly found in Southern California, though we are not without a few showy species in any portion of the state. Locally, our finest species is quite rare, being restricted to the Arroyo Seco north of Los Angeles. So few in numbers is it that until lately it has escaped the eye of the botanical explorer, being recorded in science only last year as Aster Greatai, after the discoverer. Mr. L. A. Greata, of Los Angeles. We have two others in this section that are worthy of garden culture and both grow in the low meadows toward the coast. These are A. hesperius or Western Aster, and A. Menziesii or Menzies' Aster.

Though asters probably are found in every county in the state, another flower closely allied, is often taken for them, for some of the species have flowers as large and showy as many of our asters; these are the Erigerous and the showiest, E. Philadelphicus is to be found not only east and west in this country but in Europe and other countries as well.

Most of our native asters are perennials and if one does not wish to wait to grow them from seeds they can be marked and a clump of them taken up later. Most of the species are in bloom at the present writing.

* * *

BOUGAINVILLEA AND SOLANIUM

Two subscribers, one from Southern the other from Central California, write for information concerning the propagation of the above plants.

Regarding the latter, S. Wenlandii is no doubt the one in question. We have many Solanums in cultivation (aside from the common tomato), but this one is the showiest and its truly magnificent cymes of lilac blue flowers are much in evidence just at present.

This Solanum is quite easily grown from cuttings taken from the last ripened lateral growths and will root from one month after flowering until late spring, say September to April. Take these cuttings about the size of a lead pencil, insert in pure sand, keep wet but not flooded and you will find success attend you efforts.

But the Bougainvillea, well, I guess not. No plant in general demand has so baffled our local propagators as this beautiful and innocent-looking vine. The common magenta-colored one (B. glabra) is hard enough but its brick-red variety (lateritia), the most desirable of all, is even harder to root.

Before recounting his own successes and failures (principally the latter), the writer thought he would look up the two best authorities in his library, so took down "The Florist's Manual," by Wm. Scott, one of the best known men of the craft and the man who had charge of the Floricultural Department at the Pan-American at Buffalo; next to it was, "Plant Culture," by Geo. W. Oliver, Propagator-in-chief to the United States Government. The former says: "Cuttings made from the young growths strike freely in sand in February or March." The other says: "Propagated freely from cuttings of the ripe wood." "When doctors disagree, who shall decide?" The writer has never seen any propagated from other than the ripened wood and the process is very slow.

The best way is to take cuttings four to six inches long, put in a deep box of pure sand and keep moist at all times but not too wet. They may root in a few weeks or they may take eight months to accomplish it. With wood so slow in callusing, the drainage must be perfect, the wood ripe, the cut made smoothly with a very sharp knife, and a hole made for the cutting, firmly pressing the soil close around each one. If one has an old vine of Bougainvillea they should propagate it by layers, but in any event it will be found cheaper to buy your plants of a nurseryman.

C. H. SESSIONS, ASSOCIATE EDITOR

ESSENTIALS OF SILO BUILDING.

Continued from first page)

essentials of silo building may be of value.

The Cultivator gave quite extended instructions for building silo in its issue of April 6, 1900, also in July 11, 1902. We now add some notes taken from the Orange Judd Farmer which may be of interest.

THE ESSENTIALS.

The essentials in constructing a silo are these: The building must be perfectly air-tight; the walls must be strong enough so that they will not spring or crack from the pressure on the inside, and the silo should be of sufficient depth in order that the feed placed in it will pack tight enough to exclude the air.

Another important point gained in a deep silo is that for the size of the building it will hold more feed than a shallow one, as the pressure will cause it to pack much more closely. This heavy pressure will also help exclude the air and thus help preserve the silage. A silo should not be less than twenty-five feet deep to be most effective.

SIZE OF SILO.

In planning the dimensions of a silo one of the best rules to go by is to have the diameter in proportion to the number of animals to be fed, and the depth in proportion to the feeding season. As the silo is opened at the top, and the entire upper surface gone over every two or three days, in order to prevent it from spoiling, it will readily be seen that if the surface is too large one would either be obliged to feed more to the stock each day than is necessary, or constantly be feeding silage that is more or less damaged.

A silo for a herd of twenty head of milk cows and twenty head of young stock, for a feeding period of 200 days, should be sixteen feet in diameter and twenty-eight or thirty feet deep. Where one is intending to feed silage the entire year it is usually best to up a second small silo for summer feeding.

LOCATION OF SILO.

The silo should be as near the feeding barn as possible so that the work of feeding may be done with the least amount of labor. Where the nature of the soil will permit the silo should be dug down into the ground from four to six feet below the feeding floor. If the barn is on a hillside, the silo should be located on the upper side of the barn. The portion that is below ground in most cases is the most satisfactory. Usually it can be built cheaper than the upper part; it is more convenient in feeding and filling.

MATERIALS FOR BUILDING SILO.

As a silo should last fifty years or more it is not wise to use material in building that will soon decay or is apt to warp or shrink, and thus throw the silo out of shape. Various kinds of material have been used in their construction. Some have been made of wood, some of stone, some of brick, some of cement, and some of a combination of all of these. All of these various materials, whether used either singly or collectively, if put together in the proper shape, have given satisfaction. Just which kind of a silo it is best for a farmer to build will depend upon the relative cost of these various substances in his locality. The part that is below ground should not be made of wood.

As the outward pressure is considerable on the walls of a deep silo near the bottom, care should be taken to have the wall strong in this portion. If this part of the silo is made of stone, and they are the common or irregular shaped boulders, it is a good plan to imbed in the wall, near the outside, every three or four feet, a strong iron hoop or a series of short connecting rods extending entirely around the wall. Especial care must be taken in regard to this around the doors. If the silo is made with a continuous door, rods must be used frequently to prevent spreading. Down at the level of the feeding floor the rods should be six feet apart, so that a man can walk through conveniently with a basket of silage.

DRIED SUGAR BEET PULP.

Sugar beet pulp is gradually working its way into recognition as a dairy feed. A great deal has been said as to how it can best be utilized for feeding purposes. In European countries where nothing is allowed to go to waste that science and labor can avoid, the question of making the best use of sugar beet pulp has been at least partly solved in drying the pulp at many of the factories, an undertaking which is only practical with the most efficient apparatus, and even with the apparatus used there, it has not been heretofore considered economical to adopt the system at American factories on account of comparative cheapness of feeds. But with the imporvement in the efficiency of drying apparatus at least one American factory located in Michigan, has adopted the system of drying the pulp.

Whether it is profitable the owners of the factories probably alone know, but it seems to be pretty well demonstrated that the dried pulp makes an excellent food-stuff for cows. In a recent issue of the Michigan Farmer, Mr. Colon C. Lillie, a prominent dairyman and writer, gives his experience with this dried pulp in his dairy during the past winter in the following words:

"Several days ago we fed the last of the car of dried beet pulp. I intended to order some more so I would not get out but I neglected to do so and now have to feed high-priced bran in its place. But the cows will not eat the bran; they do not seem to like it. They would come up every night and morning when they had beet pulp but now the man has to go after them. It seems to me this is the best test so far as palatability is concerned that we could get. The pasture is good and yet the cows ate the pulp clean every night and morning. Now on the same pasture they care but little about the bran, and many refuse to eat it at all. It is the same old story over again with the horses; they eat the pulp readily; but the bran as a substitute they do not seem to like. I am more and more convinced that dried molasses beet pulp is a good thing; all kinds of stock like it and they do well on it. "At first thought one would think that this pulp would certainly not be a good food for horses at heavy work, and yet my experience is that horses do well on it. It contains about 18 per cent sugar, and here I think its great food value lies. Sugar is a good food and in the form here found is a cheap food. Besides, this food has a cooling effect this hot weather and it keeps the bowels in good condition.

BEE SUPPLIES—G. G. Wickson & Co. 143 N. Main Street, Los Angeles, Cal.

LIVE STOCK AT ST. LOUIS.

F. D. Colburn, Chief of the Department of Live Stock of the Louisiana Purchase Exposition, has arranged for a total of over 26,000 prizes in the classifications for horses, cattle, sheep, swine, poultry, etc., for the World's Fair shows next year. These are unprecedented in amount and are divided among twelve breeds of beef and dual purpose cattle with 2352 prizes, four breeds of dairy cattle, 560 prizes; nineteen breeds of horses, 3458 prizes; eleven breeds of swine, 2772 prizes; fourteen breeds of sheep, 2548 prizes; 375 varieties of poultry and pigeons, 10,300 prizes; fifty-seven breeds of dogs, 2604 prizes. There are thirty-two additional prizes for single cows and herds entered in the dairy demonstration; five for oxen; fifty-five for mules and 1310 for the estimated displays of pet stock, vehicles, etc.

Provision has been made for five cash prizes and two honorable mention awards in most sections except poultry. The final arrangements of the classifications may still further enlarge the number of prizes offered.

The Louisiana Purchase Exposition will be the first world's fair to provide for the holding of public sales of pure bred stock, which are assured of crowds of appreciative buyers and good prices. Complete plans have been made for a ring for public sales apart from the main live stock amphitheater, so that sales may be held without interfering with the judging of other features of the exhibition. The sales will be under the auspices of the breeders' associations interested and within the period in which the breed will be on exhibition. The following associations have already asked for assignments of sale dates: Cattle—American Short Horn Breeders' Association, American Aberdeen-Angus Breeders Association, American Galloway Breeders' Association; horses—American Percheron Horse Breeders' and Importers' Association; swine—American Poland China Record Company, National Duroc-Jersey Swine Breeders' Association, American Berkshire Association.

The World's Fair live stock shows of 1904 will be the first in which the classifications will be uniformly divided by age periods of six months instead of one year for beef cattle, swine and sheep, thus giving proper recognition to the general method of feeding for early maturity.

The Kansas Improved Stock Breeders' Association has appointed a committee of three for each of the various breeds of live stock to work for a representative exhibit of Kansas live stock at the World's Fair.

One of the most prominent poultry breeders of England has signified his intention of making a large display of Old English Game fowls and Dorkings in the poultry exhibits at the World's Fair.

The horse said:
Up the hill run me not,
Down the hill hurry me not,
On the level spare me not,
To the hostler trust me not.

There is now in cold storage in this city about 900,000 pounds of butter, which is 200,000 pounds more than this time a year ago. This means that butter will be cheaper next January or February.

Geo. A. Smith of Los Angeles is building a house for his skimming station near Buena Park, Orange county. He now handles at that point about 8000 lbs. of milk daily.

Teacher—"In the sentence, "'Mary milks the cow,' what is the word 'cow?'"

Johnny—"Cow is a noun, feminine gender, and stands for Mary."

FOOD FOR HEIFER CALVES.

The care of the dairy cow begins with the calf. No matter what food may follow, if digestion is impaired when the calf is young the highest development is lost. This fact is coming to be more patent as the demand for whole milk increases and the difficulty of raising good sound calves on skim milk increases. Farmers feel that when whole milk is worth $1 to $1.50 per hundred it is expensive food for calves and they say that "it is cheaper to buy the calf than to raise it." This is certainly true if the calf is of doubtful origin. But not true if a reasonable forethough has been exercised in the breeding. A small investment of five quarts of standard milk each day for two months will, if the subsequent food be of a digestive nature, make a good foundation for a dairy cow. Prof. Haward proved that excelent results would follow the use of the following ration as a calf food: Wheat flour, 30 pounds; cocoanut meal, 25 pounds; dried skim milk, 20 pounds; linseed meal, 10 pounds; dried blood, 2 pounds. One pound of the mixture was added to six pounds of hot water and cooled to 100 degrees and fed. The cost of the dessicated milk is thought to be excessive. If the dessicated milk was omitted and the dried blood substituted the cost would be lessened. Six pounds of the dried blood would contain as much protein as the 20 of the dried milk, or if a small amount of whole milk was substituted the value of the ration would remain about the same.

Three months old is as soon as the calf should be fed grain. The calf can be made to take grain feed before this age, but it cannot asimilate the stuff—so nature to bring quick relief purges the animal and the scours follow. Solid food must be fed cautiously in water. The calf will not eat more than it can digest if it is given to it dry. Watch nature and learn many things about animal life.

After three months the calf will begin to take some solid food, and if not over-fed will make a satisfactory growth. It is not the rapid growth of the dairy calf that is desired; it is the uniform, steady development from the calf to the dairy cow that we should study.

A good pasture is one of the things that all calves should have and has much to do with their growth. They should have a pasture to themselves, as they will not have a fair chance when they run with other cattle. This applies to the hand raised calf. There should be shade in the pasture, and if there are no trees there should be a shed. Nothing is more detrimental to the growing calf than for it to lie in the hot sun and pant for its breath. At the proper age skim milk may be substituted for whole milk. These rations were computed for the parties who ship their milk to cities. On the western farms there will be found skim milk to take the place of any artificial ration for the young calf.—Pac. Homestead.

JERSEY NOTES.

Note that many of the Jersey advertisers are not exclusively Jersey people. That is, while Jerseys may be their pride, they have other interests in hand.

For instance, G. Y. Lytle has made his name on poultry. He handles some of the finest White Wyandottes, White Leghorns, Barred Rocks and Minorcas.

Geo. Thomas of Riverside runs pretty strong to Jerseys, yet takes no little pride in a very fine little vineyard of raisin grapes.

Mr. Keefe sits on the porch of his pleasant home and watches the oranges grow, of which he has a fine grove.

If E. E. Moore has any time to praise anything other than Jerseys, it's Berks, and he has some beauties.

Leffingwell Rancho ships some of the finest lemons on earth and lots of them. They are the biggest feature on the ranch. Notwithstanding that there is now on the ranch some of the best Flying Fox blood.

Geo. Y. Coutts centers pretty close on Jerseys. Still more, he looks at his Golden Lad with much pride.

W. J. Cole doesn't depend entirely upon the registered Jersey for his large dairy, yet his fine stock is his pride.

Guy H. Miller says "Look to breed rather than feed" for rich milk. That's why he runs to Jerseys.

J. A. and C. W. Campbell take pride in a dairy of exclusively registered Jerseys. On the side a few registered Berks take care of the wastes of the ranch.

Geo. E. Platt doesn't buy a cow because she may be pretty or of nice form. She's got to have a constitution and be a producer. She must make money or its equivalent—lots of milk. Milk production is Platt's business.

D. G. Whiting is branching out and is making a large dairy out on the desert at Imperial. His registered stock is still at his San Bernardino dairy.

Lewis Bradbury has a dairy in a different location than most of the other members. That is, it is in the higher foot hill land. His beautiful home is surrounded by plants of many varieties and as well an orange grove which produces some fine fruit. Mr. Bradbury has some of the finest stock ever brought to California.

Regarding the success of his sale of registered Jerseys, Mr. White says: The Echo Glen Jersey herd is sold, except those retained for family use. The special offering of young bulls was secured with five head for Whittier Reform School farm. The stock went to new breeders at a fair average price. They are all readers of the Cultivator and its timely aid made it possible to close out the stock so readily. The city is closing in all around Echo Glen place, and it is for sale as the severe cow-limit law forbids the keeping of a herd. Mr. White is a true Jerseyman and will not give up the business, but will gather another herd as soon as a suitable place and manager can be secured. He expects to go East to visit leading herds and dairy schools to study their methods and tests.

ENCOURAGING.

The Jersey Bulletin of some weeks since said:

"It has been remarked for several years past that the Jersey interests in the State of California is growing in a most thrifty manner. Every body is talking Jersey, and nearly every body wants Jersey cattle. The most prominent agriculturists of the State have taken up the Jersey cause, and are championing it with a vigor, and the agricultural press of that section teems with praise for the breed; all of which is encouraging for those who are ambitious for the success of this breed."

The Bulletin suffers under the disadvantage of being the organ of one breed and of necessity gets a little over enthusiastic. "Every body" isn't talking Jersey, for a lot of folks are so busy discussing "orange merger" and some other things that they wouldn't know a Jersey if they saw one.

Notwithstanding that there are a whole lot of hard-headed, intelligent men—and women—in California who know a good commercial proposition when they see it. And they see it in the Jersey for she is a money maker. There will be more money makers in California soon.

VETERINARY DEPARTMENT

Address all communications to Dr. H. D. Fenimore, Veterinary Surgeon, 642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

INFLUENZA.

Dr. Fenimore: There have been a number of sick horses here. Some called the disease "pinkeye." How does it start and what can be done for it? Please answer through Cultivator.—Subscriber, Cucamonga.

The diseases of horses known as pinkeye, la grippe and epizootic, are properly called influenza. It is a febrile disease, associated with swollen legs, staggery gait, swollen eyelids, and discharge from same; increase of temperature, pulse and respiration. Give the horse a roomy box stall; allow him plenty of fresh water; tempt his appetite and give him febrifuges and diuretics.

* * *

ACTINOMY CASIS.

Dr. H. D. Fenimore: One of my cows has a large lump on the back part of the jaw. It was first caused by fox tails. These have been removed but still the lump does not go down, nor is there any discharge from it. On the same side there is another lump on her neck and a still larger one on her shoulder. The sores cannot be moved but seem deeply seated in the flesh. A ring forms around the top of each sore and seems as though it would drop off, but does not. These do not discharge either. This one on her shoulder makes her somewhat lame. She is not sick, because she eats well and furnishes a larger supply of milk than before. Please tell me what you think causes these lumps and what I had better do for them?—Subscriber, Tulare.

Give 1½ drams of iodide of potassium dissolved in a pint of water once a day for ten days; then give 1 dram of the same for ten days more. This will kill the acute course of the disease, but will not remove the old cicatricies.

* * *

GARGET.

Dr. Fenimore: Every two or three weeks my cow's udder swells up without any apparent cause. It is always in the front, and seems to alternate regularly from side to side. The swelling generally lasts about twelve hours. The first milking after the swelling goes down the milk from that teat is badly clotted, and for a few days she gives but little milk from it. This swelling has been making its appearance for about six months, though is more frequent than at first.—Reader, Upland.

Take one pound of Epsom salts, one ounce of ginger, one-half ounce of aloes, and one dram each of nux vomica and belladonna. Dissolve in a quart of water and give all at one dose. Touch a very little antiseptic, such as creoline to the end of the teats of the affected quarters after each milking to remove a possibility of disease germs entering.

The Los Angeles Creamery Board of Trade will hold their semi-annual election of officers Saturday afternoon. This corporation has been at work for the past five years and its efforts during that time to advance creamery interests has been very successful. There are thirteen members, controlling forty creameries, whose combined output is over 250,000 pounds of butter monthly.

The stock breeders of Canada have petitioned the government to assist in making a display of live stock at the St. Louis World's Fair, by appropriating a quarter of a million of dollars for that purpose.

Coulson's Egg and Feather Food

Makes Hens Lay, Keeps Hens Strong and Healthy, Makes Feathers Grow. It costs a little more to begin with, but it is a richer and more nutritious food and is the cheapest in the end. Do not neglect to feed this food during the moulting season.

Coulson's Egg and Feather Producing Food

Is especially prepared to feed to moulting fowls, as it contains all thd elements necessary to make the feathers grow. Coulson's Egg and Feather Food is not a fattening food, but a food that makes muscle, bone and feathers. A hen may be extremely fat and yet not have the vitality to stand the strain of growing new feathers, and many hens die during the moulting process. If you want your hens to complete the moulting process quickly, and to have a beautiful, glossy plumage, just feed them all they want—a full meal at least once a day (and sometimes twice a day)—of Coulson's Balanced Ration Egg and Feather-Producing Food.

One man says that this year he has been feeding his hens Coulson's Egg Food and the hens have laid more eggs than any year before.

Another man who has been feeding Coulson's Egg Food for a year says that it makes the hens lay over the fence and lay everywhere, and you can gather the eggs by the basketful wherever you go.

It's good for the laying hens, it's good for the moulting hens, it's good for the growing pullets.

One Sack Will Feed Two Thousand Hens One Time

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

WOMAN'S WORK IN THE POULTRY YARD.

Since writing my last article on moulting I have seen the report of the New York State Poultry Institute work, with the questions asked on the moulting subject and Mr. Rice's answers which are of special interest and very valuable.

What is your system of feeding to obtain a quick and simultaneous moult?

Mr. Rice. I do not want to see that done. May be I am wrong, but I have a feeling that when a hen throws all her feathers she has not had a good moult. Would it not be be an unwise provision of nature if the bird family should throw their feathers all off? The natural course of the moult is when the hen has a few feathers slipping away, and others coming to take their place, so that you find feathers in every corner, that is the natural normal moult. But the question is, how can we make her have a natural, normal moult and get through before the cold weatner. With all these theories of moulting and feeding we have never succeeded in getting our hens all out of the moult and in good feather before cold weather came. There are always a few of them that do not respond to their feed, but the principle is right and we will get more of them out of their moult by a certain system of feeding. If we study the law of nature we will discover, that if we keep the hen stimulated, and her body in the best possible condition for laying eggs, she will keep on laying eggs long and late in the fall, and consequently when she does stop her feathers will begin to fall out. If we can make the hen rest earlier in the summer we can do it. You can take a flock of fowls, divide them equally, feed one-half on concentrated foods, and the other half on a ration of whole grains; you can feed corn, oats, wheat, all good grain, but just because you have left off the stimulating foods, you will check their egg production seventy-five per cent in less than ten days. Stopping them laying will enable them to fill their bodies with a surplus and get out of the moult. It is the natural thing for a fowl after it has drained its body by laying eggs for a long period, to want to rest, and when they begin to recover they will begin to shed their feathers. By working upon this principle we can to a certain extent control the moult.

There are certain elements that go to make the feathers and if a hen has not the vitality to make the feathers her old feathers will hang on, or if a hen is very fat her feathers fall off and she cannot make good feathers. When hens do not moult right it is generally caused by debility.

It often happens you want a quick moult. At the time of the Pan American there were many fowls that were very ragged and not fit to show. I asked a man who had some fine looking birds there, "How did you get your poultry moulted?' He said, "I starve them as nearly as possible to death for two or three weeks and when they are in the right condition I feed them all I can of the richest possible food." The idea is to let them rest. When you decrease the vitality you lose the principal things that form the feathers, and when you begin to increase the vitality the new growth will commence.

Whilst I agree with Mr. Rice in many things I think he might have given his formula for feeding moulting hens.

Practically I look upon hens as machines, feed them in a certain way and the machines will turn out eggs; in another way they will fatten and be prime eating. Feed another way and they will make feathers.

Now, the elements of feathers are very similar to the elements of eggs, and I wish to tell you a little experience of mine. I have had some hens sitting on duck eggs four weeks; this should give them a good rest, less food, and be an excellent preliminary preparation for the moult. I put them all into one yard together and fed them alike. One-third commenced to lay in ten days and the others to shed their feathers. Why there should be any difference in them I do not know, unless it may be that those that commenced to lay are such persistent layers that even moulting will not stop them.

Now as to the formula to assist (not control) the moult. The process of moulting begins with the dessication of the old feathers. The quills become dry, the juices are dried out, and the colors are dull and dead. The quills shrink within their cells and the feathers begin to drop out like ripened leaves. The dropping out of the feathers is a hot weather process and is undoubtedly hastened by a hot, dry temperature. Where it is advisable to hasten the dropping of the feathers add oily elements to the food, such as sunflower seeds, hemp, linseed meal or cottonseed meal. These produce heat in the body and increase the feverishness, drying out the quills and loosening them.

Feathers are largely composed of nitrogen with a trace of sulphur, and to make the feathers grow the food should be largely composed of substances rich in nitrogen. Wheat bran, beef scraps, lean beef, ground bones, oats, wheat, clover, alfalfa and some others foods are rich in nitrogen, whilst corn should be added as a heat forming food.

A good formula for a mash for moulting fowls is two parts bran, one part corn meal, one part beef scraps and to each quart of mixture add one heaping teaspoonful of sulphur. To the drinking water add a small quantity of sulphate of iron, just enough to slightly discolor the water, about the size of a pea to a quart of water. Give plenty of green food.

* * *

ANSWERS TO CORRESPONDENTS.

I would like to enquire through your valuable paper how much linseed meal should be fed to, say, twenty--five hens in moulting time.—J. R. H., Arizola, Arizona.

Ans. Five per cent of linseed meal three times a week is the correct amount. By that I mean for every twenty cups of dry feed in the mash add one cup of linseed meal and mix all well together before putting in the water. Cotton seed meal is cheaper than linseed, the hens like it better, and it is more easily digested.

Some answers to correspondents have unavoidably been crowded out but will find a place in our next issue. One subscriber (J. B. D.) asks for a description of roup and its cure. This I will answer next week. A new subscriber wishes for information about pigeon raising, and several want a description of the tar weed; this was given very fully in the Cultivator of June 5th.

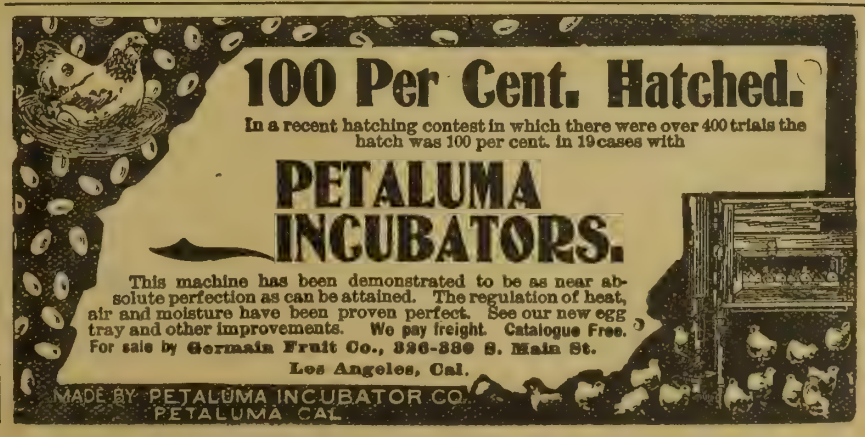
CAPTAIN MITCHELL
SANTA BARBARA, CAL.



answer through the Cultivator and oblige Mrs. W. T. Gibson, Chino.

Ans. Indian Runner duck eggs are pure white, are not coarse like other ducks eggs in taste, and look like Minorca eggs. Some of my customers are selling them for five cents a dozen more than hens' eggs, to private customers. The bakeries are very glad to get them at the same price as hens' eggs, because they go much further in cake making. The Indian Runner ducks are, without doubt, the bird that makes money in California. They are very small eaters after they get their growth, requiring no more food than a Leghorn hen. They do not have lice or mites, as their feathers are too oily and grow too close for those insects, and they never have roup. The ducklings are easier to raise than any other fowl and are ready for market at ten weeks of age. Ten ducks laid for me last year two thousand three hundred and thirty eggs. They are the greatest layers of delicious eggs of any fowl, and coming from tropical India are admirably adapted to California climate.

CACKLES.

Don't let the charcoal box get empty.

Chicks will not do their best unless their quarters are clean.

A common cause of leg weakness is eating some kind of filth.

Don't let the sick fowls drink from the fountain used by the others.

The work necessary to keep down the lice and mites is well paid for in extra profits.

The manure from the roosting house should be the foundation for a valuable compost.

Be among the chickens as much as possible and take careful note of their habits and wants.

Sour milk is good for chicks. Mix up the soft feed with it some times, but don't get it sloppy.

If you feed milk to the chicks it is best to have it sour always than sometimes sour and sometimes sweet.

Do not delude yourself with the idea that a few lice or mites will do no harm. Get them all, and do it often.

One poultryman says that much of the bowel trouble among chicks can be traced directly to lice on the parent stock.

When there are sick chickens they are liable to communicate their disease to the others through the drinking water.—Petaluma Journal.

A prominent English poultry breeder will make a large display of Old English Game fowls and Dorkings in the poultry exhibit at the World's Fair.

Little May was showing the pictures in the album to the visitor, and on coming to the picture of her father's first wife, she said: "That's my elder mother."—Tid-Bits.

THE EAGLE'S SONG.

The lioness whelped and the sturdy cub
Was seized by an eagle and carried up
And homed for a while on an eagle's nest,
And slept for a while on an eagle's breast,
And the eagle taught it the eagle's song:
"To be staunch and valiant and free and strong!"

The lion whelp sprang from the eyrie nest,
From the lofty crag where the queen birds rest,
He fought the king on the spreading plain,
And drove him back o'er the foaming main.
He held the lands as thrifty chief,
And reared his cattle and reaped his sheaf.
Nor sought the help of a foreign land,
Yet welcomed all to his own free land!

Two were the sons that the country bore
To the northern lakes and the southern shore.
And Chivalry dwelt with the southern son,
And Industry lived with the northern one.

Tears for the time when they broke and fought!
Tears was the price of the Union wrought!
And the land was red in a sea of blood,
Where brotner for brother had swelled the flood!

And now that the two are one again,
Behold on their shield the word: "Refrain!"
And the lion cubs twain sing the eagle's song:
"To be staunch and valiant and free and strong!"
For the eagle's beak and the lion's paw,
And the lion's fangs and the eagle's claw,
And the eagle's swoop and the lion's might,
And the lion's leap and the eagle's sight
Shall guard the flag with the word: "Refrain!"
Now that the two are one again!
Here's to a cheer for the Yankee ships!
And well done, Sam! from the mother's lips.
—Richard Mansfield in Philadelphia Times.

A SISTER TO BALAAM.

"I'd like to borrow a few fresh eggs, please."

Miss Martha was washing the cream pitcher, a pitcher of the quaint blue ware which had belonged to her grandmother, and she did not look around until the delicate operation was finished. Then she turned squarely and faced her caller. She was a trim, active little woman, who had not lost her youthful slenderness, and though she had begun to speak of herself as an old woman her friends were inclined to regard the title as a joke.

The girl in the doorway was of an exaggerated slenderness that made Miss Martha seem almost portly, and her eyes met Miss Martha's with the unwavering intensity of one who claims a right rather than asks a favor. After a moment she repeated her request. "If you please, I'd like to borrow a fresh egg."

"H'm," reflected Miss Martha. "Yesterday it was half a loaf of bread, wasn't it?"

"That's what I asked for," said the caller. "You gave me a whole loaf."

"And the day before," continued Miss Martha, taking no notice of this reply, "it was a cup of milk."

The girl in the doorway nooded, still keeping her unwinking gaze on Miss Martha's face. Miss Martha, vainly scrutinizing her caller's face for any trace of embarrassment, was annoyed to find herself flushing to the roots of her hair.

"I can't say that I approve of borrowing," Miss Martha went on. "If I run out of soda or molasses I just tell myself that it serves me right for not being more foresighted, and I get along without what I want till I' ve had a chance to go to town. And as long as I've got principles against borrowing," she concluded, swallowing a lump in her throat, "it's no more than reasonable that I shouldn't believe in lending."

"Then aren't you going to let me have a fresh egg?" asked the girl in the doorway. She spoke dispassionately as though she were merely interested to know how far Miss Martha's principles would carry her.

Miss Martha rallied her forces. "No, I guess not. You see, this thing's got to stop some time. And it might as well be now as ever."

"Good-by," said the girl, turning away. Then as if she feared she had been abrupt, she halted on the doorstep to say, "It's a nice morning." But Miss Martha dropped into a chair and wiped her damp forehead.

"My! that girl's a case," she ejaculated, with a distinct sense of relief as she heard the gate click behind her visitor. "She's brazen, that's what she is! The way she looks at you makes you feel as small as though she had caught you in some mean trick. I suppose I'll have to buy that Bailey place yet and tear that house down, to get rid of the neighbors it brings."

"The Bailey place" was, in fact, the bitter drop in Miss Martha's cup. The tumbledown house was halfway down the slope of the hill which was crowned by Miss Martha's neat cottage. Much of the time it was empty and then Miss Martha suspected it of affording a haven to tramps. The rest of the year it was occupied with shiftless tenants, whom she rated below the tramps, inasmuch as they were so much more in evidence. The last occupants had been in possession less than a week, and the various steps in their acquaintance had been outlined by Miss Martha in her conversation with the girl in the doorway.

The hours went by, and even at nightfall Miss Martha had not regained her accustomed equanimity. either the day had been peculiarly full of small vexations, or her morning's encounter with her neighbor had been more disturbing than she would acknowledge. Even the counting of the eggs was a disappointment. Miss Martha's pride in her hens was only equaled by the admiration of the women in the neighborhood, who were in the habit of declaring that they would give the world to know what Miss Martha did to her hens to make them lay so. At this season of the year she could depend upon them to do their duty about as she depended on the sunrise, but today the number fell short by one. And strangest of all, it was Speckle who was the delinquent Speckle's big brown contribution to the common store was unmistakable, but for once it was conspicuous by its absence.

The next day the same thing happenend. The first omission had made Miss Martha frown. The second set her thinking. Speckle did not want to set, that was certain, and she was not a hen to take unreasonable freaks, like a foolish young pullet. There was a possibility that she had stolen her nest but Speckle had never done such a thing in all her decorous life. "I thought she took it wonderfully cool when I wouldn't let have that egg," said Miss Martha to herself, her lips tightening. "I guess she'll bear watching." And the prououn did not refer to Speckle.

Along in the forenoon of the third day Miss Martha put on her hat and started down the hill in the direction of the Bailey house, with a vague purpose of meeting her girl neighbor and dropping a hint which would stop her i n her dishonest career, but instead it was Miss Martha who received the check. As she advanced toward her neighbor's her eyes wandered to the dilapidated side porch, overhung with tangled vines, and there on the upper step sat a speckled hen. Miss Martha rubbed her eyes, but those organs had not played her false. The hen was Speckle, and even as her mistress stood and stared she rose to her feet with the triumphant cackle which had gladdened Miss Martha's heart so often in the past. There was only one explanation to the mysterious circumstance Speckle had taken it upon herself to grant the favor her mistress had refused!

Miss Martha turned and went home with a strange sense of bewilderment. She was too upset to prepare her usual hearty dinner, and instead made herself a cup of tea, like any one in the world but a sensible spinster who had kept house alone for a matter of twenty-five years. She was washing a single cup and saucer when footsteps sounded on the walk, and the girl from the Bailey house came into the kitchen. She held in her hand a tin dish containing three eggs, and she set them down on the table.

"I suppose I ought to have told you before," she said, as Miss Martha turned tremulously. "Your speckled hen's been stealing her nest. For the last three days she laid on our doorstep."

She looked as if she did not expect to be believed, but Miss Martha had good reason for thinking the improbable story true. "Won't you sit down?" she said, appealingly.

The girl did not seem to hear the invitation. "I don't know as I need to tell you," she went on, "but I guess I will. I came near keeping those eggs. I thought—" her resolute young voice broke suddenly—"I thought maybe the Lord had sent them."

"O dear me!" cried Miss Martha. She crossed the room and laid her hand on the visitor's arm. "You sit right down," she half commanded, half entreated. "I've got to understand this."

The girl sank into the nearest chair and began to cry. "It was for mother I wanted the things," she sobbed. "The doctor said she'd got to have nourishing food, and what's a girl to do when her father drinks? Half the time he's out of work, and when he gets a little money he spends it for more whisky."

The undemonstrative New England woman clasped her visitor's hand. The girl leaned back against the friendly shoulder and wept as if there were comfort both in the contact and the tears.

"I didn't blame you any of the time. It was most a lie anyway when I asked you to lend things just as if I meant to pay 'em back. I know it was just the same as begging, but somhow I didn't care if only mother'd get well."

"You sit still in that chair," Miss Martha commanded. "Don't stir out of it till I get back." She hurried into the pantry and began to fill a basket which stood upon the shelves. It was a heavy basket when she brought it out, for Miss Martha's housekeeping was on a liberal scale, if she did live by herself.

"You'll let me scrub or something to pay you back, won't you?" said the girl, lifting eyes eloquent with gratitude. "I can do 'most all kinds of work, I don't care how hard it is."

"Don't worry about paying it back," Miss Martha returned, patting her shoulder. "But I don't say you can't help me out some day. That's what neighbors are for, you know, to help each other. Tell your mother I'll drop in to see her tomorrow. I'm pretty

Trousers

Appropriate at all seasons of the year is a little talk on trousers. Beginning with our special leader at $2.35—really worth $3.00—a trouser for men who have heavy work, and then our special $3.00 corduroys which are easily worth a dollar more, they run along in easy price-steps up to the fine dress trousers at $5.00, $7.50 and $10. In style, fit and comfort they're unsurpassed.

good hand at fixing up sick folks."

After her visitor's departure Miss Martha made an errand to the back yard, and carried Speckle some scraps, which that sagacious fowl took from her hand. "I can promise you one thing," said Miss Martha, looking fondly down at her favorite, "you won't ever be fricasseed or made into a pie, no matter if a dozen ministers came to dinner and there wasn't a scrap of meat in the house except bacon. Its a queer thing," added Miss Martha, a touch of solemnity creeping into her voice, "for a women of my age to be taught her duty by a speckled hen. Dumb things see more than we do, sometimes. I can't help thinking that I'll feel like a sort of sister to Balaam for the rest of my natural life."—Christian Advocate.

A LEGEND.

A legend was told me the other day which may interest you. A young man, discontented with his lot, dreamed a wonderful dream. He was carried into a beautiful country, and was driven in state through leafy boughs and under arching trees, through groves redolent with orange blossoms. Rare exotics bloomed on every side. The place seemed a perfect fairyland of beauty. After driving for miles and miles he stopped before a magnificent palace. It was built of marble, and the carving was of the finest workmanship. Its minarets and domes were ornamented with rare jewels, which flashed in the sunshine. The doors were of pearls, the floors of gold, and the ceilings instead of being frescoed, were studded with rubies and diamonds. The building was enormous of size, covering, with its wings, fully a square mile, and everything was on a scale of rare splendor. Stepping to one side of the palace, his eyes rested on a dark brown niche, small, but in such a striking contrast to the palace that he asked the guide what it meant and why it was not marble also, and set around with precious stones. Imagine the young man's surprise when he said: "The fault is yours. This is the palace Beautiful, and this is your niche. You have been unhappy because of your lowly station in life, and since you could not have a position of prominence, you have spent your time discontented, while others have been improving their time and talents. It rests upon you alone to make this place perfect." The young man awoke, saw the lesson taught by his dream, and set to work to marbleize his "brown niche."—Ex.

HOW TO COOK HUSBANDS SO AS TO MAKE THEM TENDER AND GOOD.

A good many husbands are spoiled in the cooking. Some women go about it as if their husbands were bladders and blow them up; others keep them constantly in hot water; others let them freeze by their carelessness and indifference. Some keep thm in a stew by irritating ways and words; othrs roast them. Some keep them in a pickle all their lives. It cannot be supposed that any husband will be tender and good managed this way; but they are really delicious when properly treated.

In selecting your husband you should not be guided by the silvery appearance as in buying mackerel; nor by the golden tint as if you wanted salmon. Be sure and select him yourself as taste differ. Do not go to market for him, as the best are always brought to your door. It is far better to have none unless you will patiently learn how to cook him.

A preserving kettle of the finest porcelain is best, but if you have nothing better than an earthenware pipkin it will do with care. See that the linen you wrap it in is nicely washed and buttons and strings nicely sewed on. Tie him in the kettle with a strong, silk cord, called comfort, as the one called duty is apt to be weak. They are apt to fly out of the kettle and be burned on the edge, since like crabs and lobsters, you have to cook them alive.

Make a clean, steady fire out of love, neatness and cheerfulness. Seat him as near this as seems to agree with him. If he sputters and frizzles, do not be anxious; some husbands do this until they are quite done.

Add a little sugar in the form of what confectioners call kisses, but no vinegar or pepper of any account. A little spice improves him, but it must be used with judgment. Stir him gently; watch the while, lest he lie too flat and close to the kettle and so become useless. You cannot fail to know when it is done. If thus treated, you will find him very digestible, agreeing nicely with you and he will keep as long as you want, unless you become careless and set him in too cold a place.—Ex.

HOMELY HINTS.

To make an invisible paste boil one-fourth cup of rice in two cups of water till thick, then strain.

Calfskin boots, now so much worn in cold weather, should never be blacked with liquid dressing, as the drying agent contained therein quickly cracks the leather. Instead, use a brush polish such as men use. Better still is monthly dressing of neatsfoot oil, which at once softens the leather, makes it impervious to dampness, and gives the fashionable dull black finish.

To dress kid shoes rub with vaseline while the shoe is on the foot and the leather warm. Then, grasping a strip of woolen cloth firmly in either hand, rub briskly, and you will have accomplished an "oil shine."

Children's boots will wear twice as long if the soles are painted with copal varnish while they are new.

Nothing is so nerve-trying as a pair of "squeaky" shoes, and the first thought of remedies most often make the matter worse. To remedy the squeak stand the shoes in a tin plate covered with just enough turpentine to reach the line of the inner sole without touching the "upper" leather. Let it soak for a day and then dry for two days before wearing, when it will be found that the soles are not only noiseless, but waterproof, and will wear almost twice as long. The turpentine seems to harden the leather without stiffening it.

RECIPES.

Drawn Butter.—Cook together until they bubble a tablespoonful each of butter and flour, and when they are blended add a cup of hot milk. Stir to a smooth sauce, season to taste and serve. Some persons make drawn butter with boiling water instead of milk.

Boston Baked Beans.—Soak a pint of beans over night; then put into a pot with a pound of salt pork, cover with water and boil until tender. Drain, season with pepper and salt, stir in a small cup of molasses and turn into a deep pudding dish. Put the pork in the center of the beans, cover closely and bake in a moderate oven for six or eight hours. If the beans are in a pudding dish, uncover them a half hour before removing them from the oven, that they may brown on top.

* * *

To Make Cheese Straws.—Roll a puff paste thin, sprinkle well with grated cheese and a little cayenne pepper, fold, roll out and repeat the process. Let it stand in a cold place for a time, then roll extremely thin; cut strips about a quarter of an inch wide and three inches long, take up carefully with the pancake turner and lay on the bottom of a reversed dripping-pan, and bake in a slow oven to a delicate brown. When serving hot or cold as a course at dinner or with the salad, pile cobhouse fashion on a fancy plate.

* * *

Cheese crusts may be substituted for cheese wafers if preferred. Thin slices of bread are cut into finger-lengths, buttered and toasted over a clear fire; each piece is then thinly sprinkled with grated cheese dusted with a very little paprika or cayenne pepper, and put on a tin plate in a hot oven for a minute or two to melt the cheese. They are then piled lightly on a folded napkin, laid on a plate and sent around hot with the salad course.

* * *

Lemon Sauce.—Cream one-third of a cupful of butter, add one cupful of sugar and the yolks of two eggs slightly beaten. Add a third of a cupful of boiling water, and cook over hot water until the mixture thickens slightly, then add three tablespoonfuls of lemon juice and a few gratings of lemon rind.

His cup contains no trace of joy,
He's wedded to the blues;
He seeks to find the hotel boy
Who blacked his yellow shoes.
Washington Star.

WHAT A BOY CAN DO.

Be polite.
Be prompt.
Be obliging.
Obey his parents.
Keep himself tidy.
Refuse to do wrong.
Never use profanity.
Never learn to smoke.
Keep out of bad company.
Never laugh at a coarse joke.
Never be disrespectful to old age.
Take the part of those who are ill-used.—Ex.

Boys as well as girls should be taught to sew. It may be an unspeakable convenience in after life, for a man to know how to sew on buttons and strings, to darn his own stockings, and to put a neat patch on a garment.

The few minutes just before sleep at night are as important to the child as his first waking ones. The mind works with unusal clearness just as the little frame is settling to repose. A mother should send the little one into slumber land, with a short, pleasant story told in gentle voice, and never leave to the care of servants these significant moments.

How I envy the Eskimo,
As he floats on a big ice-floe!
His palate he tickles
With ten-inch icicles,
And lunches on nard-frozen snow.
—New York Journal.

According to a report forwarded to the Swedish minister of education, children who are four years old should sleep twelve hours; children who are seven years old, eleven hours; children who are nine years old, ten hours; children who are from twelve to fourteen years old, from nine to ten hours, and those who are from fourteen to twenty-one years old, from nine to ten hours. It further points out that anaemia and weakness in children are frequently due to lack of sleep.

Behind every opportunity stands a greater opportunity. When we enter the one we find ourself facing the other. Behind it is still another, yet greater. Thus increasing opportunities present themselves as we progress. But the great never appear to him who neglects the small.—Selected.

"I wonder how many of you know the meaning of mercy," said a teacher in a Chinese mission school; and a dozen brown hands were held up. "Very good. Now you, Chang, may give us an illustration of its meaning." And Chang said, "Melican lady give Chinese boys glishes to wash. One plate fall on floor and blake in thousand pieces. Melican lady cly loud, 'O, mercy'!"—Christian Observer.

AN ADVANCE STEP.

The announcement is made in Los Angeles that the management of the Brownsberger Home School is constructing another addition to the already large building occupied by the school. A large and completely equipped gymnasium has been erected, and it seemed to Mrs Brownsberger that a building specially built for the purpose would meet the needs better than any temporary arrangement. A gymnasium handled along the lines that the Brownsberger School will maintain will prove one of the most valuable features of the institution. Its use will not be obligatory, but without doubt the innovation will be heartily welcomed by the students, as the average young man and woman who lays aside physical exercise ior mental discipline, craves something to make his blood boil at times. A trained instructor will be provided, and hours will be set aside ior the ladies and the gentlemen. The plans of the building include spray baths, lockers, and the latest and a very extensive gymnasium equipment. In fact it will probably surpass anything of the kind now to be found in the city. The Brownsberger does not believe in doing anything by halves. It is this principle that has enabled the school to graduate several hundred students during the past year, and place them in positions.

The Brownsberger Home School provides a pleasant home in the city for out-of-town students, where culture in every higher sense may be had.

A little Maine girl, in whose family there came an addition, remarked, with a sigh: "Now we shall have to cut the pie in six pieces.—Morning Star.

DOWN BY THE SEA!

A day spent on the warm sands at the seashore imparts to the mind, as well as the body, new life, new hope, and to the city weary a day of peaceful rest and quiet. The most delightful and only clean, sandy beaches are those of Long Beach and Terminal Island. Here you can lie in the warm, soothing sands and dream the hours away, or you can dig clams, gather beautiful shells and sea mosses and have a good time playing in the surf of the sea as it rolls shoreward. Agents of the

Los Angeles Markets.

Los Angeles, July 16.

Butter is in good demand with plenty of eastern arriving. The amount in cold storage is 200,000 pounds in excess of last year this date.

Eggs are in strong demand though only one cent increase over last week's quotations. Fresh eastern are arriving in quantities and readily taken.

Potatoes show a decided weakness and promise still lower quotations. The new crop is, as a rule, of excellent quality. The output of Southern California this year is said to be about 400 to 500 cars.

Watermelons are arriving in three or four car load lots a day from the desert. The end of the season for desert melons is at hand, but the local crop will probably be ready to take its place within the next ten days. The receipt from the desert supplies yet to come will not aggregate more than ten car loads.

Plums and prunes are plentiful.

SAMSON IRON WORKS STOCKTON CALIFORNIA

San Francisco Markets.

Dairy.

SAN FRANCISCO, July 16.—There is a slightly better tone in the butter market, though it has seen some ups and downs during the week. Many creameries are closing on account of feed shortage and this is materially cutting off the receipts. At present the maximum rates are demanded by holders of fancy creamery and in some cases a premium of one cent has been exacted. As a rule buyers are ordering only actual present needs. Large quantities of Eastern butter are reported en route. There are also heavy holdings in storage which will doubtless be used to prevent to great an increase.

Cheese sells up to full quotation and the tone of the market favors the seller.

BUTTER—Per lb.:

Creamery extras	.26	
Creamery firsts	.28	@25
Dairy, extras	.23	
Dairy first	.21	@22
Store	.18	@19

CHEESE—Per lb.:

Cal. Creamery, mild new, choice	12½@13
Young America	13½@14½
Eastern, New York cream	18 19

Eggs and Poultry.

Eggs have taken a very material advance and promise no decline. All offerings of selected ranch are quickly cleaned up at maximum quotations. Even lower grades are quickly taken at quoted prices.

EGGS—Per doz.:

Ranch, selected, large	.25	
Ranch, good to choice	.22	24
Store	.18	@20
Eastern	.17	@20

POULTRY—Old Roosters, per doz., 5.00@5.50; young Roosters, $8@10; Fryers, $5@6; Broilers, large, $3.50@4; small, $2.50@3; Hens, $4.50@6; Ducks, per doz, old, $3.50@4.50; young, $4@5; Turkeys, nominal; Geese, per pair, $1@1.50; Goslings, $1@1.50; Pigeons, per doz, young, $1.75; do, old, $1.50@1.75.

Fruits and Vegetables.

There are now the best of deciduous fruits, and at the same time much small and inferior stock. The latter tends to drag down the value of fancy stock. The first of yellow peaches are now arriving from the interior valleys. Available supplies of attractive lots clean up readily at the maximum quotations. First quality Bartlett pears are scarce and command top prices. The apple market is easier, with increasing supplies of fancy stock. Grapes are abundant and of good quality, but do not command quoted rates. There are still straggling shipments of late cherries with nominal quotations.

In vegetables there is a slightly increasing activity in prices of desirable quality goods, and have maintained offerings above expectations. There are liberal offerings of choice tomatoes which are commanding full figures. String beans are of very attractive stock, and command slightly increasing quotations. The first green Lima beans of the season which came in during the last week readily command eight cents per pound. Demand for asparagus slightly declined. There will doubtless be but a few more offerings of this vegetable this season.

Quotations are:

FRESH FRUITS—Apples—Per box, common to choice, 50c@$1; fancy, $1.25@1.50; Crab Apples, per box, 30@50c.

PEARS—Per box: No. 1 Bartlett, $1@1.25; common, 50@75c; other varieties, 35@65c; basket, 35@50c.

PLUMS—Per box or crate, 25@60c; baskets, 15c@40c, according to variety.

CHERRIES.—Per box: Black, 65@75c; basket, 35@50c; bulk, per ton, $20@35.

PRUNES.—Per box or crate, 35@75c; basket, 25c@40c, according to variety.

FIGS.—Per box, 25c@$1.

APRICOTS.—Per box or crate, 40@75c; basket, 35@50c; bulk, per ton, $20@35.

CANTALOUPES.—Per crate, $2@3.50.

NUTMEG MELONS.—Per box, $1.50@2.,

WATERMELONS—Per dozen: Fresno, $1.75 @$3.50; Coachella valley, 10@35c each.

GRAPES—Per crate, Seeedless, 60@85c; Blacks, 60@85c.

BERRIES—Per chest: Strawberries—Longworth, $4@7; large varieties, $2@3; Blackberries, $2.50@4; Raspberries, $4@7; Logan Berries, $2@$3; Currants, $2@4.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, $1.75@2.50, as to quality; Valencias, $1.75@2.75; St. Michaels, $2@2.75; Seedlings and Mediterranean Sweets, $1@1.50; Lemons, $1@3; Grape Fruit, $1@2; Limes, $5.50@6.

VEGETABLES.—Asparagus, per box, $1@$2.25; Tomatoes, local, per box or crate, 50@85c; do, river, large box, $1.50@2; Green Peppers, per box, Bell, 75c@$1.25; Chile, 75c @$1.25; Dried Peppers, 6c; String Beans, per lb, 3@5c; Wax, 3@5c; Green Peas, per lb., 3@4c; Egg Plant, per box $1@1.50; Summer Squash, per box, 85c@$1.25; Cucumbers, per box, 75c@$1.25; Garlic, per lb, 2@3c; Green Corn, per sack, 75c@$1.50; crate, $1@$1.75; Okra, per lb., 12½@17½c.

ONIONS—New Silver Skins, per ctl., 60@70c.

POTATOES—Per ctl.: New Whites, per box, $1@1.35; per sack, 75c@$1.10; Early Rose, 85c@$1; Garnet Chile, $1@1.15; old Oregon Burbanks, $1.25@1.50.

Future Apricots are yet uncertain though limited offerings are made at 7@7½c. Holders seem indifferent as to present sales. In prunes, local brokers claim sales will be on a 2¾ basis, with no premium for large sizes.

Dried Fruits, Nuts, Etc.

DRIED FRUITS.—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1902 crop are, per lb., as follows:

Apples—Evaporated, 4@6½c; Sun Dried, 3@4c.

Apricots—Royal, 6½@8½c; Moorparks, choice, 9c.

Peaches—4¼@6½; peeled, in boxes, nominal.

Pears—4¾@9½c.

Plums—Pitted, 4½@6c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 2⅜@2¾c, with ½@1c premium for large sizes.

Nectarines—Whites, 4@5½c.

Figs—White, 5½@6c; Black, 5c.

There is no noteworthy change in the condition of the Live Stock market, general trading being moderately active within the quoted range of prices. Hogs still lead in point of demand, with offerings of first quality stock keeping well cleaned up at the maximum rates.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1902 crop: Loose Muscatels, 50-lb boxes, per lb., 2-crown, 5½c; 3-crown, 5¾c; 4-crown, 6c; Seedless, loose Muscatels, 5c; London Layers, 20-lb boxes, per box, 2-crown, $1.40; 3-crown, $1.50; fancy clusters, 4-crown, $2; Dehesa, 5-crown, $2.50; Imperials, 6-crown, $3. These prices are subject to change without notice. Seeded, f. o. b. at Fresno, per lb.: Fancy, 16

NUTS.—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Pecans, 11@12c; Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c; Chestnuts, Italian, nominal.

HONEY—Comb, per lb., nominal; Extracted Water White, 7c; Light Amber, 6½c; Dark Amber, 5c.

BEESWAX—Per lb., 32c.

Live Stock.

Quotations are:

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 7@7½c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@8½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES.—Light, per lb., 5@5½c, gross weight; heavy, 4½@4¾c, gross weight.

SHEEP—Per lb.: Fat Wethers, No. 1, 4@4¼c, gross weight; Ewes, No. 1, 3¾@4c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb. live weight.

HOGS—Per lb: Hard grain fed, weighing alive 140 lbs and over, 6¼@6½c; weighing under 130 lbs, 6@6¼c; weighing 260 to 350 lbs, 5½@6c; rough, heavy, 5½@6c.

Hay and Feed Stuffs.

HAY—Prices on New Hay, per ton: Wheat $9.50@12.50; Wheat and Oat, $9.50@12; Oat, $8@11; Barley, $8@10.50; Clover, $8@10; Alfalfa, $8.50@$10.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50.

FEED CORN MEAL—Choice grades, per ton, $29@30.

MIDDLINGS—Per ton, $28@30.

RICE MEAL—Mill price, $18 per ton.

BRAN—Per ton, $24.50@25.50.

CRACKED CORN—Choice quality, per ton, $30@31.

COCOANUT CAKE—Best quality: In lots of 10 tons and upward, $20 per ton; 5 tons, $20.50; small quantities, $21.

BEANS—Prices per ctl.: Large Whites, $3@3.15; small do, $3.15@3.30; Pea, $3.25@3.50; Lima, $3.45@3.60; Red, $2.90@3; Pink, $3@3.10; Bayo, $3.65@3.75; Blackeyes, $2.75@3; Red Kidneys, nominal.

The scope of business in the local bean market continues narrow, as is customary at this seaon of the year, but prices are well sustained, and holders show a marked indifference in regard to sales. Available supplies are light, and the market is in excelent position for the selling interests.

Hops.

The prices for new crop are 18 @20c per lb, according to quality.

Eastern Markets.

New York General Market.

NEW YORK, July 15.—Wheat: Spot easy; options closed ¼ to ⅜ net lower, except December, which was ⅛ higher. Options opened easy under favorable weather and foreign selling, but later rallied by higher outside markets, less favorable threshing returns, southwest buying, export demand and covering. They finally broke, however, under bearish Wall street conditions, and closed ¼ to ⅜c net lower, except December, which was ¼c net higher. Sales—July, 84¼@84⅝; closed 84¼; September, 81¾@82⅞; December, 81¼@82⅛; closed 82; steady. Hides, quiet. Leather steady. Wool firm.

Chicago Live Stock.

CHICAGO, July 15.—Cattle: Recipts, 15,000; markets steady; good to prime streers, 5.00@5.50; poor to medium, 4.00@5.00; stockers and feeders, 2.50@4.50; cows, 1.50@4.25; heifers, 2.25@3.00; canners, 1.50@2.80; bulls, 2.25@4.25; calves, 2.50@6.00;; Texas fed steers, 3.35@4.50. Hogs, receipts today, 28,000; tomorrow, 25,000; left over, 7700; steady to strong; mixed and butchers, 5.00@5.40; good to choice heavy, 5.20@5.40; rough heavy, 4.50@5.20; light, 5.30@5.60; bulk of sales, 5.20@5.50. Sheep, receipts, 12,000; sheep and lambs, steady; good to choice wethers, 3.75@4.00; fair to choice mixed, 4.00@4.50; western sheep, 3.50@4.50; native lambs, 3.00@6.40.

California Dried Fruits.

NEW YORK, July 15.—The market for evaporated apples is a shade firmer, though spot demand was quiet. Common, 5@5¼; choice, 6@6¼; fancy, 6¼@7½. Spot prunes are steady to firm at from 3@7c for all grades. Apricots are steady. Choice are quoted at 7¾@8½ and fancy at 10@12½. Peaches are in moderate jobbing demand, and are about steady. Choice are held at 7@7½ and fancy at 8@10½.

Los Angeles, Cal., June 30, 1903.

The following named children have been received in the Boys' and Girls' Aid Society Home since April 1st.

Half orphans: William Higgins, male, aged 11 years, light hair, blue eyes; Harry Higgins, male, aged 10 years, light hair, blue eyes; Rowland Higgins, male, aged 8 years, light hair, blue eyes; Harry Higgins, male, aged 6 years, light hair, blue eyes; Ruby Higgins, female, aged 4 years, light hair, blue eyes; Peppa Bailey, female, aged 8 years, black eyes, dark hair; Roberto Bailey, male, aged 4 years, dark hair, black eyes; Gertrude Chapman, female, aged 6 years, dark hair, black eyes; Chester Garwood, male, aged 9 years, light hair, blue eyes; George Carwood, male, aged 11 years, light hair, blue eyes.

MRS. E. A. CHRISTIAN, Supt.

CITRUS MARKETS

ORANGE MARKET.

The market conditions in the auctions have been generally unsatisfactory during the past week, having a much greater supply than could be hadled at satisfactory prices. The condition of seedlings and sweets has been poor, most of them showing heavy decay. Strictly fancy fruit in fair condition, has brought satisfactory prices. The market should be fairly well cleaned up the last of this week and next week's sales show better results.

Western markets are in satisfactory condition, being quite well cleaned up, but with light movement and dealers hesitating to pay the higher prices for Valencias as long as the sweets and seeds continue to arrive, and sell for about $1.00 per box less.

The lighter movement from California since the first of this month should put the market in fair shape, but other fruits are becoming plentiful and cheap, and light shipments only can be used to advantage.

LEMON MARKET.

Lemons have continued to sell at fairly good prices although weather conditions are less favorable for their consumption. Shipments are generally heavy and will require warm weather to consume them at top prices. All things considered prospects are quite favorable for satisfactory results for shipments of citrus fruits now going out.

Shipments of citrus fruits from Southern California for the season from November 1, 1902, to date, are 20,422 carloads, of which number 2137 carloads are lemons.

WEATHER AND CROPS.

General Summary.—Nearly normal weather prevailed throughout the state during the week. High winds in portions of the interior caused some damage to standing grain, and several hundred acres of wheat in the Sacramento valley were destroyed by fire. Fogs prevailed in the coast districts. The damage to crops by the wind of the preceding week was overestimated.

The grain crop is being rapidly harvested and stored. Some shipments are being made, but most of the crop will probably go to the warehouses. The yield of wheat and barley in the central and northern sections is somewhat below average, but as harvest progresses the crop in many districts is proving much better than expected a few weeks ago, while some reports show that the yield is nearly average. Late wheat is slowly maturing and a very small crop will be gathered in some places. Wheat, oats and barley in Southern California are yielding the best crops for many years. Hops in the Sonoma valley are menaced by a pest which destroys vine and fruit, and it is probable the crop will be light. Sugar beets and beans were benefited by the cool, foggy nights.

Grapes are in excellent condition in all sections, and the prospect for a heavy yield was never better. Late reports indicate that deciduous fruits were not seriously damaged by wind during the preceding week and that in most sections the yield will be fully average. Apricots are of superior quality and the yield better than expected. Apples will yield heavily. Peaches are ripening slowly. Walnuts will be light. Citrus fruits are in good condition.

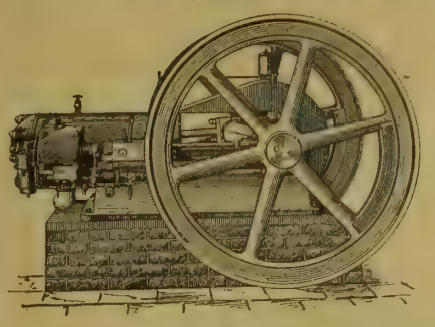
In the Sacramento valley it is learned that last week's estimate of damage by wind to the grain was largely overestimated. Fires in Yolo have destroyed hundreds of acres of grain. Hops doing well and coming into market.

In the bay and northern coast counties sugar beets doing well. Corn good. In Sonoma the hops are infested with the hoplouse, which is seriously injuriig the crop. Damage to fruit by hot winds less than anticipated.

San Joaquin Valley:—Third crop of alfalfa being cut. Wheat good. Fruits in fine condition.

Southern California:—Fine bean crop in Santa Maria section. Apricots ripen slowly. Walunts will be light. Grapes excellent condition. Threshing progressing. Canneries in full operation. Royal apricots nearly all harvested.

"Western Engines"



Made at home of finest material and by best of workmen. Adapted to California conditions. More work with less fuel and less trouble than any other engine, at as low a price, guaranteed.

We also handle the famous OTTO gas and gasoline engines. And for light power (3 H. P.), the "Stickney, Jr." It's a beauty and works like a charm.

CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXI—No. 4 LOS ANGELES, CAL., FRIDAY, JULY 24, 1903 Subscription $1 a Year

Five 30-Foot Silos of Lynwood Dairy

Comments on Various Feeding Stuffs

Since the writing of the article on "Silo Building," which appeared in last weeks' issue of the Cultivator, a request for more information on feeds has been received. We also have on hand "Feeding of Farm Animals," by Messrs. Jaffa and Anderson, of the State University, published in 1901, from which we quote at length.

First, however, it might be well to refer to alfalfa, which was spoken of in the last issue as being little used for silage. It is, however, well known that the first cutting of alfalfa is always more or less lowered in value by the large amount of foxtail which is necessarily cut with that crop, and in regard to that we note in the last issue of the Dairy and Produce Review, the following:

"We are pleased to learn that one alfalfa dairyman is pleased with his experience in siloing alfalfa. This dairyman is F. B. Marks at Dos Palos, Cal. For four years he has been filling his silo with the first cutting of alfalfa and finds that he gets much more out of it than by curing it for hay. Generally under most California conditions, he says, the first cuttings of alfalfa in the spring are full of foxtail, which matures early and makes a very poor hay on account of the objectionable beards. If the alfalfa is put into the silo this foxtail becomes soft and as appetizing to the herd as the alfalfa. In view of this experience our dairymen might find the silo an important adjunct to their alfalfa fields. Alfalfa is becoming an important food material in hog raising, the green article leaving nothing to be desired as a pork producer, the draw back being to carry them through the season when green alfalfa is not abundantly available. For this purpose it has been found that siloed alfalfa makes an excellent feed and makes it possible to winter brood sows and stock pigs at an extremely small expense, no grain food being necessary. We are just beginning to understand the alfalfa crop."

As to the comparative worth of silage, vegetable and alfalfa, we quote as follows from the above mentioned bulletin:

One of the chief requisites of a ration for profitable milk-production is that it be succulent, by which is meant that a portion of the ration contains a large percentage of water. This watery condition, or succulency, adds to the palatability of the food, and also seems to have a beneficial physical effect upon the animal digestion. The cow, therefore, eats a largr quantity of food, digests and assimilates it more thoroughly, and consequently gives a larger flow of milk. Although the major portion of California does not have the long cold winters to which the eastern states are subject, and where it is an absolute necessity to store large quantities of food, both succulent and dry, still every section of our state has a longer or shorter period during the year when pastures are dry. The provident dairyman, therefore, anticipates these dry months, and either lays in a store of green food beforehand, or has some growing which he may cut and feed to his cattle.

Roots.—Several of the vegetables are valuable in supplying succulence for the ration. Among the root class the one in most common use is the mangel wurtzel beet, because very large quantities can be grown per acre and because it is palatable to all kinds of live stock. Carrots are also used in some sections, and they have the advantage of containing a slightly larger amount of dry matter than mangels. Of all the roots moreover, none are more relished by horses than carrots. Sugar beets are not found profitable to grow for feeding stock, because they yield so small a tonnage in comparison to mangels, and the greater cost of growing and gathering can only be undertaken on the ground of their greater value for sugar. Potatoes contain about twice as much dry matter as mangels and three times as much carbonaceous material. They are, therefore, of greater food value, but, like sugar beets, have too high a commercial value as

(Continuedon page 57)

Improved Methods of Handling Dried Fruits

Of the 150,000,000 pounds of prunes produced on this coast, 90,000,000 to 120,00,000 pounds are produced in the wonderfully fertile section of the Santa Clara Valley. This year's output will exceed 100,000,000 pounds if present estimates are correct, the central and principal shipping point of which is San Jose. There are more or less prunes produced along the coast, even Oregon and Washington having something of an output, which is increased every year. Notwithstanding that, the peculiar adaptability of the soil and climate about San Jose give it such a hold on the industry that there isn't the slightest possibility that its prestige as a prune growing section being disputed for a moment. The soil is of such a nature, and much of it is naturally sub-irrigated, that at one time it was claimed irrigation for prunes was unnecessary in that section. More recent years have developed the fact that much better results of the soil have been achieved through surface irrigation, so today the puff of the gas engine is heard in various parts of the valley.

The method of orchard handling, of pruning, the gathering and curing of the crop, is the same as in other sections of California, but a visit through the packing houses gives a new idea of the magnitude of the prune industry, and enlightens one who has seen prunes grow most of his life in other sections of the state. Of course, the greater part of the curing is done largely in the orchards, and in such cases individual growers store their fruit, but as a rule, the orchards for miles about San Jose ship their products directly to the large storage houses in the city, after sweating, where it is usually stored in large warehouses. Of course, hundreds of carloads are shipped out in sacks, soon after the curing season, but the greater amount is held in these large warehouses, from which it is taken and processed, packed in large boxes and shipped during the following year to all parts of the world.

The packing houses in which this processing is done, give employment to a large number of working people, and add not a little to the growth and prosperity of this bustling city.

As noted before, a visit to these houses is a little education in itself to one who has never been through them. It was the pleasure of a "Cultivator" representative recently to visit several of these houses in company with H. M. Barngrover, manager of the Ernst Luehning Co., and witness the manner of handling the fruit from the bins to placing in the cars. The most interesting feature naturally was the labor saving machine, which permits a maximum amount of fruit to pass through the house with a minimum of labor.

If the storage bins are on the first floor, the endless chain elevator carries it to the upper floors where the process begins. From stage to stage it is carried to the different tables or machines by gravity or by carriers, according to the necessity. The first procedure is the shoveling of the prunes from the bin, with their hard dried skins, and some of them white with sugar which has exuded. They are shoveled in a hopper, on a level with the floor, which drops the prunes onto the carrier elevating them possibly two or three floors, and deposited on the table of the grader.

As they pass over the screens on this machine they are separated into their various sizes from 30-40s to 100-120s. From this they are again placed in piles until ready for packing in twelve and a half, twenty-five or fifty pound boxes.

Next step is to pass them through the processor, which is a propeller passing them through boiling water. This machine is provided with means for introducing steam to the inner part of the drum, through which the fruit is compelled to pass. It is perhaps a couple of feet in diameter and twelve or fourteen feet long. The time in which the fruit is kept in its progress through the drum is under the control of the operator, and varies according to the size and condition of the fruit. Approximately, three to four minutes is the time, and as may readily be seen, this great heat brings the fruit out practically cooked to the center.

Contrary to the usual idea, these are not placed on trays and redried, but are instantly placed in shipping boxes which may be of capacity to hold twelve and a half, twenty-five or fifty pounds. The larger sizes are usually placed in smaller boxes for the more exclusive trade. These boxes are lined with paper, that part which goes over the top being pinked and ornamented so as to make an attrac-

STILL GROWING.

Eight thousand two hundred copies of the Cultivator will be mailed to subscribers this week. And still we grow. Last week we made a net gain in circulation of 115, and this week the net gain is 123 copies. Not bad for summer time, we think. At this rate of growth our list will soon reach the 9,000 mark.

Watch us grow!

GETTING THE WORTH OF YOUR MONEY.

The Cultivator calls the attention of its subscribers to what should be one of the best features in the Cultivator, that is the answers to inquiries, which are given by our able corps of contributors.

Dr. H. D. Fenimore, of this city, is one of the most able and conscientious men in the veterinary profession. He is always ready to answer Cultivator subscribers through the columns of the paper.

Prof. Cook is equally as ready and capable in a line of practical farm science.

J. W. Mills, at the head of the Pomona experimental station, is dealing every day with practical questions which enables him to give the best of answers to questions regarding deciduous fruits, vines, etc.

John Isaac, clerk to the commissioner of agriculture, will give information regarding conditions in the northern end of the state.

Mrs. Basley understands poultry in all its features, and is giving much help to subscribers of the Cultivator who have been sending her inquiries.

Send in questions to these writers, or if along other lines than these deal with, send directly to this office, and we will answer them if they are answerable.

State Quarantine Officer A. Craw reports that the brown apricot scale which afflicts prune trees has been pretty effectually got under control in the bay counties. This has been accomplished by that little parasite, Comys fusca.

MORE CO-OPERATION.

Nearly every week it is our pleasure to announce some new movement along the co-operative line, which shows that co-operation is extending its work in all departments of agriculture.

Some time ago we noted in these columns that one reason why milk which brought the farmer 2 or 3 cents a quart, was sold to customers in the city at 6 to 10 cents per quart, and gave as an illustration that an observer in a large apartment house had seen seven different milkmen deliver milk to one house in the morning, and that, to a certain extent, has been the plan of some of the dairies about Los Angeles.

plan of some of the dairies about Los

Some months ago a couple of the largest dairies of this city, viz., those of C. H. Sessions and Geo. E. Platt combined and have secured a vastly more economical distribution of milk by that means. For the last few months other dairymen, taking in nearly all besides the Belle-Vernon Farms Company, have united and now have an organization which aims to distribute products of the dairy far more economically than was done before. They have formed a corporation of which Horace G. Hamilton is president; J. O. Sullivan, vice-president; S. E. Lawrence, secretary, and H. J. Woollacott, treasurer.

In addition to the first three named, the other directors are J. L. Starr, T. S. Hamilton, E. T. O'Sullivan and Frank M. Lynch.

These gentlemen and some others of the association will still control and manage independently their own farm and dairy. But each will deliver his own milk to the distributing house, which is on San Pedro street, between Eleventh and Twelfth. The new company is called the Glenn Holly Dairy, and has erected a very fine plant, covering several lots, in extent 160 by 358 feet. On this tract has been erected a building for receiving and distributing which is cement floored and will be provided with all appliances for cleansing cans, sterilizing, etc. In front will be the offices and in back of the receiving room will be the cleansing room, closets for the workmen, harness cleaning rooms, etc. On the side are the sheds, in which the distributing wagons will receive the milk, and on the back of the lots are stables for thirty-two horses, with room for another stable of like size.

The products of seven large dairies will be received and distributed every morning and evening, as will some smaller dairies, which as a matter of accommodation, may also put their milk through this concern, and this means the produce of 800 to 1000 cows.

Pres. Hamilton, who is likewise manager, informed the "Cultivator" of the saving in expense of distributing from better appliances, and economy in purchasing in all will allow them to distribute milk for much less than it cost before. In fact the saving is going to be far in excess of their first anticipations.

Verily co-operation is winning in new lines each day. We hope later to give a more extended notice of the arrangements of this concern.

LECTURES ON FORESTRY.

On Wednesday of next week, July 29, will begin the series of lectures on Forestry, at Idylwild, above San Jacinto, Riverside county. The lectures will continue for two weeks—until August 10. There will not only be lectures but practical field work, botanizing trips, etc.

A tuition of $6 will be required, which entitles the student to admission to all of the lectures and to join in all field work of the class.

There are few subjects of more vital importance to the people of California than a full understanding and appreciation of the principles underlying rational and systematic Forestry. The beneficial influence of forests in conserving the seasonal rainfall, and hence the importance of maintaining forest covers upon mountain slopes, are now fully recognized the world over.

The lectures will be divided into six several topics, as follows:

Life-history of a Tree: Four lectures on the activities, structure, and methods of reproduction of a typcial forest tree.

Classification of Forest Trees: Three lectures on the classes of forest trees and their salient peculiarities.

Forests of California: Three lectures on the forest regions of California, their composition and relation to altitude, rainfall and temperature.

The foregoing all by Dr. Willis L. Jepson of the department of botany of the State University.

The Practice of Forestry: Four lectures on the general principles and fundamentals of forestry.

Silviculture: Four lectures on silvicultural methods, natural and artificial regeneration of forests, propagation, planting and thinning.

Afforestation and Reforestation: Two lectures on the treatment of barren or cut over areas, with special reference to conditions in California.

These lectures by Prof. Arnold V. Stubenrauch of the department of agriculture of the university.

MUTUAL INSURANCE.

The annual meeting of the California Association of the Farmers' Mutual Insurance Companies was held last week at Fresno. The various county associations appointed delegates, but not a great number were able to attend. Notwithstanding, there was much interest manifested and the feeling prevailed that mutual insurance as established in California is here to stay. The success of these associations has not been specially startling, although the growth has been so continuous and the slight losses have made the cost to members so exceedingly light that the gospel of co-operation will be extended by the results of the associations now in existence. Secretary Cromer of the Los Angeles County Association spoke and in his remarks said:

There are over 2000 mutual fire insurance companies in the United States, and they are growing rapidly. There have been twelve companies organized in California since 1897. Insurance in the hands of large stock companies has been subverted from its true mission, and has become a means for amassing great wealth for capitalists and salaried officers, exacting from the insured, as statistics will show, premiums at least double the sum paid for actual losses.

Speaking of the Los Angeles Mutual, the secretary said after four years' organization the losses amounted to only $600, only one assessment was made, and there is in the treasury $3500. The membership is 1100 and the property insured aggregates $1,000,000.

Other papers and discussions which will aid in extending information as to the benefits of the co-operative insurance were features on the program. Pres. Sorensen of Fresno county companies reported one-half million insurance prevailing in that association. Sec. Cromer of Los Angeles reported one and a quarter million insurance in force. This insurance in Los Angeles county has been carried at such a low cost to the members of the company, and under the law the buildings which may be insured are such that the cost must necessarily remain low, that present members are carrying their insurance for almost nothing.

Election of officers resulted in the re-election of the old ones, who are: F. E. Kellogg of Goleta, president; N. G. Nelson of Kingsburg, vice-president; G. F. Cromer of Los Angeles, secretary and treasurer.

PACIFIC COAST ADVERTISERS.

The Cultivator has taken a step during the past week which is new in its history and contrary to that of most of the newspapers on this coast, but which it believes for its best interest and the best interest of its advertisers.

Heretofore the Cultivator, and most other papers here, allowed commissions to advertising agencies for all business passing through their hands. This has at times proved satisfactory, at other times quite the reverse. There has been more misunderstanding and more loss of business through this dealing with a third party than the gain has seemed to warrant, hence the decision to deal directly with our Coast patrons.

We have determined to make the paper of more value than ever to both subscriber and to advertiser and this is our reason for this step, and not any desire to make war upon the agencies which have given business to the Cultivator in the past.

FROM A BUSINESS STANDPOINT

By J. W. JEFFREY, Los Angeles

SANTA CLARA SELLING AGENCY.

The various co-operative fruit unions of Santa Clara county, at a recent meeting held at the headquarters of the Farmers' Club at San Jose, started a movement that will find them fully within the class of producers who market their own products. In fact much progress has already been made to that end. The new organization will be known as the Santa Clara County Fruit Agency, and its plan of operations are in the main similar to that adopted by the California Fruit Agency last March. As everything concerning the selling of fruit is of particular interest at this time of the year, when reorganization is beginning to attract attention, the Cultivator presents the articles of agreement between the co-operative organizations and the proposed fruit agency. It will be of value to the northern readers of this journal as well:

"Do by these presents create the organization known as the Santa Clara County Dried Fruit Agency, for the purpose of selling the products of those uniting in this organization, and transacting such other business as may be assigned to it. Other associations, corporations, firms or individuals may be admitted to this agency, and fruit may be sold for associations, corporations or individuals by the assent of three-fourths of the Board of Control.

"Each organization shall operate as a packer, and shall prepare its product for market in such manner and under such brands as each shall decide. All grading of fruit shall be determined by the Board of Control. Fruit sold through this agency shall by brand indicate where grown.

"This agency shall be managed by a Board of Control, consisting of one representative from each organization, now or hereafter becoming parties to this contract, which representative shall hold office during the pleasure of the organization which he represents.

"By the word organization as used in this contract is meant any member of this association.

"The Board of Control shall elect a manager, who shall not be a member of said board, and shall fix his compensation. He must be elected by a two-thirds vote of the board present at the time of his election. The manager shall be the general executive officer and shall conduct all business and handle all funds under the direction of the Board of Control, and shall give such bond for the faithful performance of his duties as the Board of Control shall determine.

"He must agree on accepting employment from said board not to deal for himself directly or indirectly in any of the products sold by this agency, and he must devote his entire time to the business of the agency.

"No member of the Board of Control can be elected to hold any position to which any compensation is attached, except as hereinafter provided.

"All officers shall hold office at the pleasure of the Board of Control.

"Meetings of the Board of Control shall be held quarterly and the date of the meeting shall be fixed by the Board of Control. A majority shall constitute a quorum for the transaction of business. Special meetings may be held on the call of the president or any three members of the Board of Control, two days' notice thereof being given to each member, notices to be sent by mail.

"Each member of the Board of Control shall receive a fee of two dollars and a half ($2.50) for each meeting that he attends.

"The Executive Committee shall meet once a month and oftener at the call of the chair.

"Each member of the Executive Committee shall receive a fee of two dollars and a half ($2.50) for each and every meeting that he attends.

"The Board of Control shall establish agencies and conduct business for the sale of fruits and shall take such steps toward advertising and making

known the value of our fruit as a food product as they shall deem proper. The Board of Control shall arrange for the purchase of supplies at wholesale, and furnish the same to members when desired, at cost.

"This organization being perfected, the several organizations hereinbefore named shall make and constitute it the sole agency and means of sale and disposition of their entire product, by means of the contract hereto annexed.

"It is also agreed that the foregoing conditions become a part and parcel of the following contract, to be signed by the several organizations:

Next week we shall present the form of contract by which the growers assign their fruit to the agency. Herein will be found a wide difference from the contract with the citrus growers with the California Fruit Agency.

SEASIDE INSTITUTE.

The following is the program for the Farmers' Institute to be held all of next week at Long Beach. All sessions will be in the Congregational Church. Free camping privileges are to be granted with free water. This is expected to draw large numbers who will drive a distance of forty to fifty miles with camp equipage.

In addition to the following, there will be the best of music, and an invocation will open nearly all sessions. The afternoon and evening sessions will also devote some time to question box and answers by the conductor, Prof. Cook.

PROGRAM.

Monday, July 27, 9 a. m.
Address of Welcome, J. A. Miller.
Response, A. J. Cook, Claremont.
Distillate Spray or Fumigation, R. C. Allen, Bonita.
Insects (practical), A. J. Cook.
Plants (practical), A. J. McClatchie, Arizona, Experiment Station.

Afternoon, 2 o' clock.
Chemistry for the Ranch, L. H. Loughridge, University, Cal., Berkeley.
Quarantine against Insects, Alexander Craw, San Francisco.
The Dairy Cow and the Dairy, Mrs. Minnie E. Sherman, Fresno.

Evening, 7:30 o'clock.
Floriculture, Ernest Braunton, Los Angeles.
The Horticultural Commission, J. W. Jeffrey, Los Angeles; S. A. Pease, San Bernardino; E. L. Koethen, Riverside.
Insects (practical), A. J. Cook,

Tuesday, 9 a. m.
Plants (practical), A. J. McClatchie,

Afternoon, 2 o'clock.
Chemistry for the Ranch, L. H. Loughridge.
Floriculture, Ernest Braunton,
Shall we extend our citrus groves? N. W. Blanchard, Santa Paula.
The Dairy Cow and the Dairy, Mrs. Minnie E. Sherman, Fresno.

Evening, 7: 30.
Care in Handling Citrus Fruit, C. C. Chapman, Fullerton.
Our State Agricultural Department and the Rancher, J. H. Reed, Riverside.

Wednesday 9 a. m.
Insects (practical), A. J. Cook,
Foreign Markets, Thomas Stone, Pasadena.
Co-operation, J. S. Edwards, Redlands.
Plants (practical), A. J. McClatchie.

Afternoon, 2 o'clock.
Chemistry for the Ranch, L. H. Loughridge.
Marketing Our Fruit, A. H. Naftzger, Los Angeles.
The Dairy Cow and the Dairy, Mrs. Minnie E. Sherman, Fresno.

Evening, 7:30 o'clock.
Floriculture, Ernest Braunton,
Frost Protection, Dr. E. W. Reid, Ioamosa.
The Farmers' Vegetable Garden, F. Kahles, Montecito.
Experiment Station Work, A. J. McClatchie.

Thursday, 9: a. m.
Insects (practical), A. J. Cook,
Successful Grape Culture, Mrs. Minnie E. Sherman, Fresno.
Plants (practical), A. J. McClatchie.

Afternoon, 2 o'clock.
Chemistry For the Ranch, L. H. Loughridge.
What Civic Pride Should Do for Us, Mrs. L. F. Darling, Riverside.
Food Adulteration, Hon. Elwood Cooper, Santa Barbara.
The Dairy Cow and the Dairy, Mrs. Minnie Sherman, Fresno.

Evening Session, 7:30 o'clock.
Floriculture, Ernest Braunton.
Direct Primaries, Hon. Edward M. Camp, Los Angeles.
Legislation, A. J. Cook, Claremont.

Friday, 9:00 a. m.
Insects (practical) A. J. Cook,
Bacteria and the Rancher, Roy K. Bishop, Orange.
Plants (practical), A. J. McClatchie.

Afternoon, 2:00 o'clock.
Chemistry for the Ranch, L. H. Loughridge.
Microbe Diseases, Dr. V. A. Moore, Cornell University, Ithica, New York.
The Dairy Cow and the Dairy, Mrs. Minnie E. Sherman.

Evening, 7:30 o'clock.
Floriculture, Ernest Braunton.
Cattle Diseases, Dr. A. R. Ward, University Cal., Berkeley.
Livestock and the Dairy, Prof. Leroy Anderson, San Luis Obispo.

Saturday, 9:00 a. m.
Insects (practical), A. J. Cook,
Farm Organizations, Prof. C. B. Sumner, Claremont.
Plants (practical), A. J. McClatchie.

Afternoon, 2:00 o'clock.
Chemistry for the Ranch, L. H. Loughridge.
Fertilizizng the Orchard, Frank L. Palmer, North Pomona.
The Dairy Cow and the Dairy, Mrs. Minnie E. Sherman.

Evening Session, 7:30 o'clock.
Floriculture, Ernest Braunton.
Education, Dr. Geo. A. Gates, Claremont.
Direct Legislation, C D. Willard, Secretary Municipal League, Los Angeles.

KILLING SQUIRRELS.

The San Jose Mercury takes exception to the statement made by Prof. Cook, that poisoning is more effective than carbon bi-sulphide as a means of getting rid of the pest of brown squirrels. After quoting the Professor's remarks made in the "Cultivator" of three weeks ago, the Mercury says:

Professor Cook's estimate of the value of bisulphide of carbon as a squirrel exterminator will not be endorsed by the orchardists and farmers of the foothill districts of this county, who regard bisulphide of carbon as by long odds the best squirrel antidote they have ever used and one which they believe it will be hard to improve upon. Properly applied at the proper season of the year, it will kill ninety per cent on once going over a field, and the second application will kill all that are left.

This is not the experience of one man, but of hundreds in Santa Clara valley. It is not essential that the ground be wet; if it is moist enough to plow well it will answer every requirement. Broadly speaking, the season for using the carbon effectively is from the first general rain to May 1st.

The most approved method is to apply it by means of a pump made expressly for that purpose. This consists of a galvanized iron cylinder with a hand bellows attachment, by means of which the carbon fumes are forced through about three feet of hose directly into the squirrels' holes. After the hose is inserted into the hole, dirt is tramped (with the foot) around it; from twenty-five to forty strokes are given on the bellows, the hose is withdrawn and the opening left is also closed and tamped.

The expense of clearing land of squirrels by this method, including labor, will not exceed $1 an acre, and it is frequently done for half that amount.

Those who do not care to invest in the pump can obtain almost as good results by tearing rags into strips and winding them into balls about the size of a hen's egg. Saturate the balls in the bisulphide, lift them out with a pair of tweezers, apply a match and roll them down the hole, which must be filled as rapidly as possible. The tweezers or pincers are necessary to avoid burning the fingers, as the gas generated is highly combustible.

The same treatment is equally good in exterminating gophers or any burrowing animal.

The Agricultural Department has issued a highly valuable bulletin describing the various kinds of scale and pests that afflict fruit trees and the remedies for their extermination. Fruit raisers may write to the secretary at Washington and receive Farmers' Bulletin No. 172. It is sent out free.

Coast News and Notes

By R. A. Dague, 1045 Regent St., Alameda

Potatoes are reported as doing finely in Alameda county.

Six bee men in the vicinity of Pomona own 5050 colonies.

The lice have seriously damaged the hop vines in the Sonoma valley.

Apricots are selling to the canneries at Niles for $30 and Bartlett pears at $25.

The Board of Supervisors of Alameda county has appropriated $10,000 for the St. Louis Exposition.

There will not be many apricots dried this year at Niles. The crop is being shipped East or canned.

The third spraying for the codling moth has been completed in the Pajaro district, Santa Cruz county.

There seems to be a movement in Central California in favored section in favor of planting orange and lemon orchards.

At the last weekly sale of Santa Rosa forty-five cases of eggs were sold to San Francisco parties for 24¼ cents per dozen.

The potato market in Central California has recently taken a spurt upwards; caused by a lively demand for Burbanks for seed.

The ranchers in the vicinity of Stockton are dissatisfied with the present prices of hay and are holding in anticipation of better prices.

It is said that not more than 70,000 sacks of the 500,000 of beans raised in Ventura county are on hand and they are being rapidly disposed of.

The condensed cream factory at Visalia is this year doing a large business. They frequently send into San Francisco a car load of their products.

The Best Manufacturing Works of San Leandro have just sent into the Sacramento valley one of the big combined harvesters with a traction engine.

Joseph Saccone, near Oroville, has one black fig tree 18 years old, from which he picked and shipped 65 boxes of ripe figs, each box averaging 15 pounds.

Santa Rosans are very proud of the performance of the mare Lou Dillin on the eastern track. She is the fastest mare in the world, going a mile in 2:02¼.

The tomato crop of the state is not up to the average. Early in the season contracts were closed at $7 per ton. Canneries are now ready to contract at a higher price.

Hunt Brothers cannery at Haywards has finished their pack of cherries. They are now running on pears, plums and peaches. The tomato crop is not promising.

S. V. Ryland, an ex-tobacco grower in the south, has been looking over California and says the business could be made very profitable in many localities of this state.

Horticulturists of Marin county recently held a meeting and organized a branch of the State Horticultural Alliance. Delegations from San Francisco and Oakland attended.

Luther Burbank is to have some recognition because of his great service. The general government will recompense him and provide him hereafter with a scientific assistant.

There will be a state convention of wine manufacturers and grape growers held at St. Helena, Cal., on August 15. A general attendance is desired by those who are promoting the call.

The San Jacinto Cannery Co. is now in full operation with 75 hands. Superintendent Joseph Wallace estimates that about $75,000 will be paid out for labor and fruit in and around that place.

There are now 278 acres of young tomato plants growing within a radius of four miles of Yuba City. It is estimated that they will furnish material for 100,000 cases of canned goods.

San Francisco is about to begin the erection of a Polytechnic High School building to cost $375,000, where students can be taught farming, carpentering, cooking, sewing and other useful things beside foot-ball.

Shipments to the East of late Crawford peaches is just beginning. Bartlett pears are going forward daily. California fruits are selling at fancy prices in eastern markets. It brings an average of about $1000 per car.

The yield of honey in California in 1899 was 3,677,729 pounds in 1900, 2,208,000 pounds, in 1901 4,600,000. The counties of Fresno, Tulare and San Diego led in the production. Ventura county will be lighter than usual.

For many years it was said that Southern California persistently advertised its attractions while Central California did not. A change is taking place. There is a movement all along the line to advertise this part of the state.

The Earl Fruit Company shipped eight full cars of fruit from Sacramento to London, England, last week. While crossing the Atlantic it was kept at a temperature of 36 degrees. The value of the fruit was placed at $15,000.

The state fish commissioners have now for distribution 100,000 young rainbow trout. Commissioner Vogelsang says that the Siskiyou hatchery will furnish enough young trout this season for all the streams north of San Bernardino county.

J. A. Anderson, of Lodi, claims that the inspectors in some parts of the county are neglecting their duty. He says: "I visited some fifteen or twenty orchards and found none that had complied with the law, yet this fruit was being packed and shipped."

At the last meeting of the State Board of Trade, J. A. Filcher made a report of crop prospects. From it we note hay turns out to be a good crop. Apricots and walnuts which promised but half crops in May have turned out to be much better than expected.

After an exhaustive inquiry into the hop situation in Sonoma county L. D. Jacks reports that the yield this year will not exceed 10,000 bales. He says reports from Oregon are to the effect that that state will not produce over 70,000 bales. The hop louse has seriously injured the vines.

Parties that have tried it say that a liberal and persistent use of oranges will cure the whisky habit. One reformed inebriate said every time the maddening desire for whisky came he would start right in and begin to eat oranges and continue to eat them as long as the appetite for whisky lasted, frequently consuming fifteen or twenty oranges a day. The acid quality of the oranges appeased the desire for alcohol. What a magnificent outlet for culls.

The State Board of Agriculture has decided to deed its state fair ground property in Sacramento to the state, conditional upon the payment of $45,000 which is appropriated by the last legislature. This will result in throwing the entire management of the state fair into hands which will probably give us more of an agricultural fair than we have heretofore had. Some features not pertaining to agriculture will be abolished, and others very materially reduced. If these hopes are realized it is probable the state fair will be a benefit to horticulture and agriculture of the state. If this is not done the producing class should raise up and demand a closing of the institution under state recognition, at least, which in the past has been anything but encouraging to agriculture.

WELL PLEASED.

J. T. Davis, the Pomona Poultryman, whose ad of Black and White Minorcas, Barred and White Rocks and Leghorns has appeared so long, writes:

California Cultivator, Los Angeles, California.

Gentlemen: Please find my check in payment for my ad in the Cultivator. Please drop ad out until further notice as I have sold my property here where my yards were located and will have to make some changes before I will be in shape for doing much business in this line. But I must say that I am well pleased with the results from my ad in the Cultivator this season and that I expect to continue to advertise in the Cultivator as soon as I get shaped for business. Yours respectfully, J. T. Davis.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

(Continued.)

In our journey through the insect realm, we have discussed those often called insects, but which are not; the water breathing crustacea, with the familiar crayfish and the very common sow bugs, which rest beneath nearly every damp board in California; the class Myriapoda, with their indefinite number of legs, the great eight-legged or spider group, with the tiny, though destructive mites and ticks, the scorpion group and the beneficial spiders, and we are just peering in to the real insects, which we found always had six legs when they were mature, three well marked parts of the body, head, thorax and abdomen, and which pass through perhaps the most wonderful transformations of any of the great swarms of animal life.

* * *

Head Organs.—The head organs of insects consist of the eyes, both simple and compound, the antennae and the mouth organs. As before stated, the eyes are both simple and compound. The compound eyes are made up of a great number of simple eyes in close contact, so they look like miniature honey comb, as the simple eyes are usually six-sided. Wee use our two eyes as one, and so we see about as well if we close one of our eyes. Not so with these compound eyes of insects. Each eye has its special image, and so if any one of these simple eyes were gone, there would be a blank in the object which was being viewed by the insect. The simple eyes are structurally like the compound eyes. There may be one, two or three, though in many cases there are none at all. Just what the function of these two kinds of eyes is, no one knows. It is probable that many insects are quite keen in sight, and are quick to distinguish colors. We know that no insects are valuable in flower pollenation. It is probable that the color of the flowers is simply to attract the insects that they may perform this valuable service.

The antennae are the horn-like organs which reach out from the head of each insect. When I say that these are really the smell organs, we at once understand their importance, and see why they are so common in this great branch of Arthropoda. Insects, like bees, that are often attracted to flowers by odor, have very well developed and complex antennae. Many insects, on the other hand, like large numbers of bugs and many of the lace winged flies, like the dragon flies, have very short antennae. It is probable that the male is often attracted to the female by odor, in which case we find that they have antennae remarkably developed. This is true of many of the moths like the silk moths, and also of the male bee. The minute structure of the antennae shows numerous pits with pegs protruding from the bottom. The number of these pits or holes and the attending pegs are often very numerous, in which case we may be sure that the insect has a wonderfully developed sense of smell. As an illustration of the delicacy of sensitiveness of this sense we have well recorded examples of male moths being attracted by the emergence of a single female. I have known a female to come out in a room and a single window many feet distant ajar but two or three inches and yet a half hundred males came into the room in the late afternoon. Male moths have been known to come down chimneys through a stove pipe and the stove and out of the damper under similar circumstances. Indeed, I once saw a great number of these males outside a closed window and upon examination, found a female moth just from the cocoon inside the room.

The mouth organs are quite complex in nearly all insects. Insects may be classed in two different groups because of the character of these mouth organs. First are the biting insects, or Mandibulate insects, as they are called. These have what we call typical mouth parts. All such insects bite and so eat up whatever food they may require. I will briefly describe these organs. We may say that there is an upper and a lower lip. The upper lip, called labrum, in form and position is not unlike the fore piece of a cap, so it is quite simple. Opposite this, forming the floor of the mouth is the lower lip, or labium. The back of this might be called the chin and is called the mentum, while the front part is known as the ligula. On each side of this lower lip is a jointed organ known as the labial palpus. The sides of the mouth are made up of two double organs. The upper pair consists of the mandibles. These are the strong jaws, which enables the locust to strip the hard bark off from large twigs, enables the grub to bore through hardest wood, and makes it possible for caterpillar and beetle to devour leaves and even quite heavy twigs of plants. These mandibles or jaws work side-wise; and so each is a simple organ and may itself be armed with minute teeth. Just below these are the second jaws or maxilae. These always move sidewise but are far from simple. Indeed they are usually composed of several parts. Almost always three parts in line from base to tip, with other longer jointed organs on the sides known as maxillary palpi. We find these typical mouth organs in all laced wings like dragon flies, white ants and ant lions; all of the locust group, all beetles, including the grubs, all caterpillars, and in all of the highest order, bees, wasps, ants, etc. As I have stated, all these insects can bite and eat, hence these, and these alone, can be killed by putting Paris green into or on their food. Thus we poison caterpillars, grubs and beetles by the use of poisonous sprays, and locusts by a poison bran mash, which is made palatable by adding some sweets.

The second group is made up of those insects that suck rather than eat, and so we may say they have modified mouth parts. They are also known as haustellate insects, and are also sometimes referred to as suctatorial insects. In all these cases the mouth organs are converted into sucking tubes and thus they pierce plant or animal and suck the juice or blood. It is easy to see that these could not be killed by putting poison on to the affected plant. This is why we never can kill bugs, plant lice or scale insects by use of the arsenites. In all theese insects some of the mouth parts are wanting. Thus the bugs have no palpi at all. The two winged flies are without the labial palpi and the butterflies and moths usually have only the labial palpi, though in the lowest family we also find maxillary palpi. Their long sucking tube consists of the two maxillae, each of which is grooved, and as they are placed side by side, they form the long tubular tongue or sucking tube. The imago diptera, or two-winged flies, and also the mature bugs, form a tube by placing their organs side by side, though this tube is largely formed by the labium or lower lip, which is a grooved organ. As already suggested, the bug in all stages, the two-winged flies, and the moths and butterfly, when mature, are illustrations of these haustellate insects.

I was glad to see the little editorial in the last Cultivator urging the young people to watch and study insects, to read carefully these articles, and thus look into this wonderful page of natural history. There are several young people around Claremont who are making fine collections of insects and are taking great pleasure in the work and study. They are gaining far more than pleasure. A habit of observation and a valuable discipline which will aid them much in life's work. Any boy or girl, or any of the older boys and girls, the orchardists, by looking at the mouth parts of a locust or beetle may be able, especially by the aid of a good lens, to make out all the parts described above. I cannot say too much for this habit of observation and study among the great hosts of insects that so crowd about us in our walks in the brushwood and through the canyons.

(Continued in our next.)

* * *

FULLER'S ROSE BEETLE IN A NEW ROLE OF MISCHIEF.

It was my great pleasure last Saturday to meet with the horticultural commissioners and inspectors at their monthly meeting in Los Angeles. This getting together once a month to report observations and discoveries, to compare notes, and to offer suggestions is certainly a very wise and bright proceeding. I can hardly express my pleasure and satisfaction in this conference and wish it were so I could be with them at each of these monthly meetings.

I was most interested in what I learned from two of the wide-awake inspectors regarding a new enemy of the raspberry and strawberry. Specimens of the insect were brought in and were submitted to me for identification. I at once recognized them as the grubs and pupae of our old and all too common enemy, Fuller's rose weevil. This beetle is known to science as Aramigus fullerii. In the East where attention was first called to it only a few years ago it was called Fuller's rose beetle, because the grubs were discovered as a pest on the roots of the rose by Mr. A. S. Fuller of New York City. So far as I know, the imago in the East is only disturbing as a green-house pest, where it works on the palms and other rather thick-leaved plants. I do not need to say that here the beetle is a grievous pest in the citrus orchards. It usually does not do very much harm except in case of budding over our orchards, when the extent of its mischief is sometimes very formidable. It may, and often does, destroy great numbers of young buds and twigs that grow from them.

I have often wondered since coming to California where the grubs or larvae of these numerous beetles were to be found, and have feared that some day we would wake up to the fact that they were as serious a pest in the larvae stage as in the mature state. Now we find that they exist in great numbers in the strawberry beds of some parts of our country and are equally destructive in the raspberry plantations. Indeed, it was stated that a single spadeful of earth would often contain great numbers of these grubs. They not only bore into the crown of the strawberries and roots of the plants but they also remove the bark from the roots vey extensively. It is reported that they are doing very serious damage. Specimens of both kinds of plants were on exhibition and they showed that the alarm was all too well founded. I am fully persuaded that we have in this Fuller's rose beetle one of our most alarming insect pests. The very fact that its damage is great in both larvae and imago stage may well cause us to wish that it had never invaded our coast. It probably was in California before it was discovered as a mischief-maker in the East and I think there is reason to believe that it came to us from Hawaii. It is not strange that it should work on the roots of rose, strawberry and raspberry, as we know all these plants belong to the same great family Rosaceae. It will not be at all strange if they are also found to work on apple, peach, pear and other plants of this same great natural order. It loks very likely that we may have to take up arms against this pest and strive hard to accomplish his extermination.

It was suggested by one of the inspectors at the meeting Saturday that bi-sulphide of carbon would prove the best remedy. I have no doubt of the correctness of this statement. When the blighting of a plant shows that the insect is at work, a small hole close beside the plant should be made six or seven inches deep by use of cane or iron rod, a tablespoonful or more of the liquid poured in when the earth should be quickly pushed onto the hole and pressed down with the foot. This work can be quickly done, will be sure and effective, and certainly ought not to be neglected. The underground home of the grub and the hard crust of the weevil with its probable short life above ground will tend to make it free from parasite. This makes it all the more necessary that we fight it to the death. It will be remembered that the imago has no wings, and so cannot gain access to the tree top except as it crawls up the trunk. Bandaging these last with cotton or by some trap may enable us to keep the insects from our trees. I have had a great many inquiries this spring regarding blight of raspberries, loganberries, etc.. I have often said I do not believe the trouble to be true blight and have asked if the roots of the plant have been examined. I believe we many have the explanation in this Fuller's rose beetle. I hope to have illustrations in time for this article. If not I shall illustrate it very soon. The importance of the insect more than warrants it.

* * *

LA HABRA INSTITUTE.

There will be a Farmers' Institute held in the La Habra school house on Monday, August 17. This is one of the most beautiful and productive valleys in California. The people are wide awake, and the success of the Institute is assured in its very inception. There will surely be a large attendance as there will be a very excellent program. I passed through the valley the other day, and was as on a previous occasion simply amazed at the great fields of splendid corn grown with no irrigation.

* * *

THE APPLE SCALE.

Last night I received from one of our horticultural inspectors a number of spider nests containing eggs. He thought them to be the cotton of the maple scale, familiar as an enemy to the maple and the grape in the East. While he was mistaken in thinking these to be the scale eggs, he is no doubt right in his statement that apples are suffering very largely about Downey from the work of this scale. I was very familiar with this scale in

the East. It is one of the scales that are always active, and is known to science as Pulvinaria innumerabilus. The scale is found in the spring with a large mass of cotton protruding from its hinder extremity which it raises from the twig. This is full of eggs which are thus well protected. These hatch and work on the leaves till fall, when they pass to the twigs. In the spring they again take to the leaves, become mature, secrete the cotton and lay their eggs. The inspector who sent the specimens says that they are worse on trees which were treated with the lime, salt and sulphur wash in the winter. I wonder if this can be true. I should suppose that this application or the distilliate spray would be efficient remedies against this pest.

California Horticulturally...

John Isaac, Sacramento

TOO MUCH CREDIT FOR AUSTRALIA.

The brown apricot scale, which has been very bad in Sonoma country is disappearing under the work of the Comys fusca, which has been distributed through there for several years and now appears to have taken thorough hold and is doing the work as was expected. The Vedalia cardinalis, which was introduced some years ago for the Cottony cushion scale, has made such a reputation for parasitic and predaceous insects that to the lay mind there must be some sort of Australian bug to destroy all our pests, and we notice that some of the upper country papers state that the scale is disappearing in Sonoma county as the result of the introduction of the Australian fly. The Comys fusca, which is the insect doing the good work is not Australian, nor do all the good things come from Australia .(The Comys fusca is introduced from South Africa.—Ed.)

* * *

THE BLACK SCALE PARASITE AT WORK.

Very encouraging reports are being received by the State Horticultural Commissioner, regarding the work of the Scutellista cyanea, which has been very widely distributed for work on the black scale. A few weeks since a number of letters were received from sections in which these insects had been liberated which were doleful in their statements and more so in their predictions, and it looked as though the new parasite had not come up to expectations in the south, although it has done remarkable work in the north. Lately, however, these reports have changed, and it now appears that the parasites are showing up in great numbers in all the sections where they have been liberated. Mr. Craw is now operating in the southern counties, investigating the work of this and other parasites, and the fruit growing public will await his report with a great deal of interest. As a rule we expect too much from our friends in the insect world. A pest is introduced in a section and it spreads steadily for years until it covers large area. We fight it by artificial means at infinite cost of money and labor, to say nothing of losses of crops, and this may go on for years, yet when its natural enemy is introduced we expect it to clear out the pest that has been years in spreading in a few months. Although these parasites breed with great rapidity and are doing wonderful work, it should be remembered that we have a very large state to cover, and no parasite can be bred out in sufficient numbers in a few months to do the work required of them. From the work we know the Scutellista cyanea has done we believe it to be a wonder, and that it will ultimately overtake the black scale, and this work can be expedited by careful distribution, but if it accomplished all we desire in five years it will have done a wonderful work will be worth many millions of dollars to our state.

SULPHURING FOR RED SPIDER.

Red spider is repotted from some of the almond and prune sections as having shown up quite badly in the past two weeks and as doing some damage in a few places. Its destructiveness does not appear to be so wide spreead this season as usual, and it is confined to more limited areas. The present season has been late, cool and moist, conditions unfavorable to the rapid breeding of this pest, which delights in hot, dry weather, during which it increases enormously and spreads with wonderful rapidity. The common remedy for this spider, and one which has so far given general satisfaction, is dry sulphur, which is now being used in the orchards wihch have shown the spiders in destructive quantities. The California University has experimented with a small admixture of wheat flour, made into a paste, with the sulphur and used in solution. We have not heard to what extent this has been used or the success of it, but in sections where the air is very dry, and it is here that the spider is the worst, it would seem a very rational way of using it. The great object is to get the sulphur to attach to the trees until the heat of the sun can cause fumes, which are deadly to the spider, to arise from it. For this reason the dusting is usually done in the early morning when the trees are supposed to be damp from the dew, which frequently they are not, and a large part of the sulphur falls to the ground. A very small amount of the flour paste mixed with the sulphur, causes it to adhere to the foliage and, it is claimed, gives much better results. In using sulphur it pays to be sure that you have the pure and the proper article. With sulphur only the sublimed, or flowers of sulphur, should be used. This quality will form fumes under the sun's action and accomplish the desired result, while other forms of pulverized sulphur will be of no more use for the purpose than so much fine sand. It is for this reason that there are so many failures in the application of insecticides, a false economy leads the users to get a cheap and worthless article under the impression that he has complied with all necessary requirements and, when failure results, blames the formula. In using sulphur for red spider, be sure to get the best sublimed.

* * *

HELP IN THE FRUIT HARVEST.

The fruit season is now at its height, canneries, packing houses and dryers are all running, and there is now every probability that we shall be able to care for at least the greater part of our fruit crop. With the experience of last season before us it was feared that the shortage of labor would be very severe this season, more severe than last, in fact, and that losses from this cause would be very heavy. As the season advances, however, the indications are that, while we could do with very much more help than we have, and while there will be some losses from lack of help, the damage from this cause will not be so heavy as was anticipated. We are beginning to feel the benefits of the work of the California Promotion Committee which, under the direction of Harry P. Stabler, has done good and effective work during the past year. It is to be hoped that this committee will not be allowed to flag in its labors, but continue to induce reliable workers from the farming sections of the East, where they have been working, to cast their lot with us in California. The condition this season is very much improved, and it is hoped that each succeeding year will see an influx of white workers, until they crowd out the Japs, who are said, by those who have had to rely upon them for help, to be much more undesirable than the Chinese.

The legislature of the Territory of Hawaii has passed an act providing for a Board of Commissioners of Agriculture and Forestry, in which provision is made for a forest policy for the islands. This act provides for a superintendent of the Forest Department, who will have charge of all matters relating to forestry, and will be assisted by a corps of foresters and rangers. The territorial senate has passed a bill which appropriates about $23,500 a year for two years for the Department of Forestry.

The bother of being a millionaire—the million heirs.

"Oh, no—there ain't any favorites in the family," soliloquized Johnny. "Oh, no! I guess not! If I bite my fingernails I catch it over the knuckles. But the baby can eat his whole foot and they think it's just cunning."—Denver Republican.

By J. W. Mills, Ontario, Cal.

THE EARLY GRAPE SECTION.

Editor Cultivator: Could you publish in your paper the date of ripening of the earliest table grape in California? My object is to find out whether grapes ripen earlier at Indio, Coachella, Yuma or Imperial, than they do in the Sacramento or San Joaquin valleys, and if so, how much earlier. Information on this subject will be appreciated by a number of your subscribers. A. M. Aplin, Highlands.

We cannot give dates of ripening of the earliest varieties, but the papers tell us that Flaming Tokays arrived from the Colorado River district about two weeks ago. These grapes were said to be ripe and as delicious as this variety usually is. It must be remembered that Tokay is not an early grape, so we cannot even guess when the earliest varieties would ripen in that locality, neither can we surmise where the earliest locality is, for only a few points in the earliest part of the state have vines growing now. We do not think that any grapes have been growing long enough in Imperial to test that locality. Coachella has been shipping out Thompson's seedless the past few years as an early grape, but they have recently secured varieties that are a month or so earlier than Thompson's seedless. We do not know of grapes maturing earlier than July 10th of this year, in any locality in California. If any of our readers can give us correct information on this subject, we would be glad to receive it. There is one thing settled, and that is Southern California contains the earliest fruit section in America as far as is known.

* * *

DOUBLE ONIONS.

Editor Cultivator: I bought some onion sets last winter, planted them, and instead of one onion growing where I planted one, I have a crop of 3, 4 or 5. Is this peculiar to certain varieties or not? Many went to seed also the first year from planting the small sets. What variety will mature first when planted in the fall or after our first rains? Will an onion set one inch in diameter go to seed more readily than one the size of a pea, both being the same age? Why should the groceryman charge 3 and 4 cents a pound for onions when he pays only one cent to the grower? Please answer through the Cultivator. Amateur, Pasadena.

All onion sets have the making of more than one onion, that is, there are always more than one germ to a bulb. This is shown when we plant the finest onions for seed. When onions are selected for seed growing, the most perfect in shape are selected, but when the seed stalks come up, there are from two to half a dozen to each onion. Under natural conditions, an onion is a bi-ennial. It grows from the seed and makes a big bulb the first year. The next year the bulb produces flowers and seed. If we plant the seed so thick that the bulbs will not mature properly, they make what we call sets. They are simply stunted onions that are not able to make seed in one growing season. If planted early enough in the fall, they will sometimes make two or three growths and then go to seed in the spring. Several periods of growing occasioned by alternate dry and wet spells will encourage this. If the sets are too large they will also have a tendency to go to seed. It is true that a set that is one inch in diameter will go to seed more readily than one the size of a pea. This is because it has stored up enough material in the bulb to make it reasonably safe to make the attempt. We do not make the assertion that plants reason, but it seems that they are endowed with something that makes them act as if they did. Some onion sets will make double onions more readily than others. The seed from which the sets are raised sometimes accounts for that. An uneven supply of moisture might do the same thing. Whenever dry onions sprout, it is the development of all the divisions of the bulb and this takes place always after the bulb has a resting period. This resting period is brought about by withholding the water sometimes, and if the sets are raised from poor seed, the tendency is still greater to duplicate or develop all of the bulbs.

The white Italian varieties of onions mature the quickest. New Queen is the most generally used. This variety also goes under the name of Extra Early Barletta.

The grocerymen pay one cent for onions and sell them for three and four cents, because the growers allow them to. If the fruit and vegetable growers would organize, establish their own fruit stands to do their own local selling direct to the consumer, there would be prosperity among the growers of small fruits and vegetables that has never been seen. We may be wrong on this point. It is a little out of our line. Suppose you ask Mr. Jeffrey to give you an article on that issue.

* * *

SUMMER TREATMENT OF RASPBERRY BUSHES.

Editor Cultivator: Will you please state in your next issue, how I should trim my red raspberry bushes after the present crop is off. The new shoots were all pinched back about the first of June. Any information on the subject will be gladly received.—H. W. H., Gardena.

Pinching back at the time mentioned was correct treatment for the new shoots. That forces out more laterals which increases the bearing surface for next year. As soon as the fruit is off all of the canes which have just borne the crop should be cut out clear down to the ground. All small or weak canes of this summer's growth should be cut out also. This will have a tendency to make the remaining canes to produce finer and handsomer fruit next season. It is also just as important to keep the bushes well irrigated and cultivated from now on as it was before the fruit matured. This is not done sometimes and the result is an inferior lot of berries. We would advise also, that as soon as the old brush is cut out and burned, you spray with Bordeaux mixture. This will prevent to a certain extent the bad effects of fungus that might be present. We are of the opinion that there is considerable of this kind of disease present in this state, though we have not heard much complaint. It is a fact that during the past two or three years the Logan berry vines have not been so prolific as they were previously, and this year there was a greater falling off than ever in the crop. There was every indication of a large crop, but toward the beginning of the last half of the season, the berries dried up on the vines. The leaves also seemed to be affected. We suspect that there is some sort of plant disease at work on them. This will be looked up and we hope, if there is some fungus that is responsible for the loss, that we will be more successful in combating such diseases than the eastern growers have been. They labor under the disadvantage of having a number of well established fungus diseases in their raspberry plantations. When once there, it is almost impossible to get rid of them. Therefore, we advise the use of preventive mthods. Spraying with Bordeaux mixture will prevent the entrance of these diseases. The only effective way of combating some of the diseases of raspberries is to plant on clean ground and be sure that the plants used are entirely free from disease. As another precaution, it is well to try new varieties, say two to four bushes each of some other kinds than you have. It has been observed that Columbian, which is a good red sort, is notably free from raspberry cane-blight, and this variety is being largely substituted for Cuthbert in some districts in the east. Hansell is a good red raspberry, fine color, vigorous, earlier than other varieties and very productive. Malboro is perhaps the largest red raspberry, ripens soon after Hansell, but is not as fine in flavor as the latter or Cuthbert.

The subject of fertilizers for raspberries has never been tested in this state far enough to give any results that are of value. This has been done in the eastern states, but that will not apply with us. However, there can be no mistake in putting on barnyard manure.

* * *

BEST LATE CROP FOR GREEN FEED.

Editor Cultivator: Will you please tell me what would be the best crop to plant at this time for green feed for horses? What would be the best fertilizer for the crop? I also have some space under walnut trees. Could it be utilized? My space is quite limited, so would like to know what I can get the most from by fertilizing. I have plenty of water.—A. J., San Gabriel.

Sorghum will make as rapid a growth as anything that we know of with plenty of water and fertilizer. You need a nitrogenous fertilizer for that. Barnyard manure or nitrate of soda will give the best and quickest results. Either should be applied after the plants are up provided the fertilizer is soaked in with the irrigation water. The seed should be soaked for twelve hours and then sowed at once. When the grain is taken from the water, it should be sifted with dry sand. The sieve should be fine enough to mold the grain and allow the sand to pass through. This will remove the surplus moisture so that the grain will not stick to the hands or machine that sows it. The soaking will insure a perfect stand and a rapid growth from the beginning. Part of your land might be planted to carrots, for they will continue to grow after frosts come and thereby lengthen the season of green feed. Horses are very fond of both sorghum and carrots. The former will fatten horses readily and there is no danger in feeding it. Cured sorghum will sometimes kill cows because they do not chew it thoroughly and the horn like shell of the stalks sometimes injures the stomach and causes inflammation. Horses will not swallow what is not thoroughly ground up. If the soil is fairly rich, there need be no occasion to fertilize the carrots as they will do well with ample irrigation.

We would not advise planting anything under the walnut trees. It will be a money losing proposition all around. The trees should be given every advantage, and as they are in bearing you will find it expensive picking nuts from among a growing crop.

Address all communications to
Dr. H. D. Fenimore, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

By error last week "Actinomycosis was made to read "Actinomy Casis."

ECZEMA.

Dr. Fenimore: Mrs. H. of Wilmington, has a cow which is covered on neck and sides with eruptions of the skin which, when dry, peel off and leave small round bare spots from the size of a nickle down. Otherwise she appears healthy, eats well. What is the cause and the remedy?

Give 1 lb. of Epsom salts, 1 oz. of ginger, ½ oz. of aloes, and 1 dram each of nux vomica and belladonna, dissolved in three parts of water. Follow in two days with a tablespoonful of nitrate of potassium and hyposul phate of soda, equal parts, morning and night. Keep the sores bathed three times a day with a tablespoonful of creoline to a quart of water.

METHODS OF HANDLING FRUITS

(Continued from first page)

tive looking box. As noted the prunes are deposited in these boxes steaming hot, and still dripping from the boiling water. Each box is weighed and pushed from the weigher over the rollers to the power press, where the attendant forces down the prunes to a level with the top of the box. They were before three or four inches higher than the sides and held in place by extensions. Instantly the ornamental papers are brought over the surface, the automatic carrier taking them, and they are passed to the nailing machine where with the pressure of a foot the attendant instantly releases the clutch of the nailer and the cover is nailed on. The boxes are then taken in charge by the warehouse man, piled high on trucks, and removed immediately to cars, or to some place conveniently near the loading platform.

The largest packing house in San Jose is that of the Santa Clara Valley Fruit Exchange, a co-operative institution which handles from twenty to thirty million pounds of fruit each year. One of the most complete houses and best adapted to economic handling of fruit, principally prunes and apricots, is the new house just completed of the Ernst Luehning Company. A view of this house is given in the cut on first page, as is a cut of the large power grader of the third floor. This building is 72 by 96 feet, has four floors, a capacity of at least 5,000,000 pounds a year, and fitted with modern up-to-date labor saving machines in every department.

The building of machines for this class of work has brought into existence in San Jose one of the largest institutions of its kind on the coast. This is the Anderson-Barngrover Mfg. Company, which employs more than one hundred hands in putting out machines for all kinds of fruit drying, fruit processing, fruit canning and even harvesting machines.

The house began business some fifteen years ago, and has used as a motto, "Every machine the best in its line." Their first work was the putting out of the Pioneer Prune Dipper which for many years was the only machine of its kind. This was not improved on until the combined power dipper, perforator and spreader was put out, so complete as to be almost automatic in its handling of fruit. Besides this, they put out baskets, dippers, tanks, processors, presses, nailing machines, orchard and dryyard trucks, etc.

One of the handy manufactures of this firm is an orchard truck, built low for use under spreading trees, which has had immense sales in the orchards about San Jose. Its low construction not only aids in getting about the orchard but in handling the fruit, almost no lifting being necessary.

Although as a usual thing the climate of California is such that the best of results are secured in drying prunes in the open air, there are occasions, in some parts of the state, when the weather not only proves exasperating, but is such that great loss sometimes occurs from the fog or possibly rain. The prunes which have been spread out not only do not dry, but such weather too long continued will result in the fruit decaying on the tray. While this condition may be comparatively rare, yet the fearful loss when it does come has given rise to the construction of dryers, some of which have been very expensive, and equally unsatisfactory, both in cost of manipulation and in expense of fuel; but Messrs. Anderson & Barngrover have succeeded in providing a plant for artificial drying, which is comparatively cheap in construction, effective, and permits of very economical handling of the fruit. These driers are so constructed that the ordinary fruit tray may be run directly into them and left until the fruit is ready for the sweat bin. Distribution of the heat is equal in all the different compartments.

We have entered thus fully into the descriptions of some of the appliances put out by this firm because we know that it may be of great value to the subscribers of this paper.

During the past year dairying in Central California has increased fully twenty-five per cent, while in the southern part of the state the increase in dairy products is only about five per cent. Los Angeles is the best market in the whole west for dairy products, there never having been a year since dairying has been a business, when the home supply was equal to the demand. There are still plenty of chances to build up a paying business in the dairy line in all parts of California.

Gearing of the New
Pomona Deep Well Pump

Contains Machine Cut Gears and Unbreakable Machine Cut Forged Steel Pinions, that run smoothly and perfectly noiseless. Long stroke and steady movement of Pump Rods; breakages reduced from 30 to 50 per cent. Pomona Valves constructed on new and improved plan, built of Bronze and Steel, contain large water ways. Made in sizes from 4 to 13 inches. Specialty made of open shaft propositions and heavy lifts. Address

Pomona Mfg. Co., Pomona, Cal.
or FAIRBANKS, MORSE & CO. Los Angeles

C. H. SESSIONS, ASSOCIATE EDITOR

INFLUENCE OF GREAT BULLS.

The greatest steps in the improvement of the Jersey, both in its native island and in the larger American field, have been marked by the influence of great bulls. It often occurs that more than one of these bulls, whose inflence risese to dominance in the breed is from a single dam. This reflex action tion shows the tremendous influence that the blood of a single cow may have in shaping the fortunes of a breed.

In every breed whose progress is governed by the best of performance (and fashion is shaped by success in that performance), it is surprising, in the trying out of myriads of individuals in the breeding field, how a select few exert a plasmatic influence which lifts their descendants to a higher average capacity than the great mass of their fellows. Not only this as performers, but in another generation such an advanced family or tribe finds by experimental crossing some other characteristic tribe or family with which it so blends as to place the offspring on a still higher plane of average performance and breeding power. Along with this average tendency to higher results, there come occasional individuals, both male and female, that so far exceed the rest as to stand out conspicuously as leaders of the general advance. The breeding power of these exceptional individuals cannot be foretold, though certain conditions of pedigree and form are considered indicative features. But silently and in the test of time the best rise to the top and dominate the field of scientific breeding. The blood of Eurotas breaks away from Darlington and works its quality of improvement from the Atlantic to the Pacific; the blood of Stoke Pogis 3d leaves its St. Lambert home in Canada and permeates the herds of the United States; the blood of the black cow Sultanne and her double decndant Golden Lad,spreading from her native home in Jersey, infuses her quality into the herds of England and American until every show ring and public dairy test ties a blue ribbon to it.

The most profitable reward, under present conditions for which a Jersey cow can be successfully bred is ability to win in the show ring, while the real measure of highest value should be ability to win in butter making contests. This condition is due to circumstances rather than to the public's highest ideal. There is no medium of competitive dairy test that is equally accesible to all, and that affords confidence in results. At heart, the great American public honors and patronizes a performer. Yet it wants the performance to be made in open competition, with equal conditions of advantage and restriction, safeguarded to all, before it will pay homage to the doer. Until these circumstances can be secured, the show ring will continue to be the leading field of adventure for the breeder, and the "looker" will outsell the performer.

It is at this point that a great deal of discontent now pervades the breeding of Jerseys. Some of the plainer sorts that are deep churners feel that they are not getting the recognition due to their merit, while more showy cattle are being sought by moneyed investors. On sporadic occasions, systematic dairy tests, conducted at the world's fairs and commanding public confidence, have given us a taste of the widespread interest existing in the "battle of the breeds," proving that, were the opportunity continuous and readily accesible of entry, the spirit of rivalry, like the snowball, would gather as it rolled until its following would constitute an industry, the effect of which, transmitted to the general dairy stock, would in time add millions to its economic value.

For the reason that prevailing conditions of butter tests are not satisfactory, they are apt to be ignored by the buyer who prefers to judge upon form. When certain particulars of form are before him, his admiration impels his belief that he cannot be far wrong, and that he is as safely getting the cow he wants, by the type and symbol, as he would be by relying upon announced butter tests, such as they are. In the same spirit, he pays special deference to show winnings and high auction prices as evidences of merit if the transactions are above his suspicion and the cow "looks it." The saving clause in this anomaly is that in the general average the best looking cows (as dairy types are judged) are really the best general dairy cows, and, similarly, if less uniformly, the best butter cows. Thus we get, in a more roundabout way, the general result that a better system of competitive tests would reach by a shorter and more direct road.

These circumstances account largely for the more eager demand of late accorded to imported stock of high dairy form as compared with less showy native cattle. Besides, a somewhat circumscribed butter test often comes with the island cow, which at least has the merit of publicity of performance safeguarded by the jealousy of open competition on the fair grounds, and hence carries some value in the bidding. When prize cows at the shows and "toppers" at the sales run numerously in family groups, the "form" seeker honors the blood with his confidence the same as he would honor blood that by satisfactory test had turned out many creditable performers.

By whichever standard honors are assigned, the winners are credited back to their various sires. In effct, the bull is even more than half the herd. He is the turning point in success or failure in most breeding varieties. And this does not depend entirely upon his independent merit, but also upon his special fitness for what he is to cross with.

This country has almost invariably been fortunate in the charater of the Jersey bulls which have been imported. Mr. T. S. Cooper, the largest importer, has conscientiously sought always to bring very high class bulls, and his care and skill in this respect have been such as to make it a credit to have one of his importation. In his home-herd days, he was no less discriminating, and for his own use has more than once set an example of liberality in outlay that confirms the sincerity of his argument as to the importance and value of a bull of high caste.

It was no small compliment to Mr. Peer's acumen as importer that Mr. Cooper paid him $2250 for the world-famous Golden Fern's Lad at his recent importation sale—the best price this year for a bull. And Mr. Cooper feels that he has secured the greatest living Jersey bull, for he says that "Lad" will live and die at Linden Grove as Pedro did before him.

Of all tests by which a bull can be chosen, the already-tried sire offers the most conclusive assurance of success in breeding. Golden Fern's Lad, while yet of useful age, has achieved this condition as probably no other island bull ever did while living. His son, Flying Fox, is making a grand push for like achievements. Imported St. Helier did it years ago in this country.

Of American bred bulls of similar achievements, Champion of America, Duke of Darlington, Stoke Pogis 5th, Pedro, Signal, Exile of St. Lambert, Stoke Pogis of Prospect, King of St. Lambert, and Hart's King lived to profit by their own honors. Such bulls are almost priceless. Every one of those named was a great money maker for his owner. Each was a herd founder, and made an independent reputation for a breeder or specialized one already made.

We cannot all have such tried bulls; indeed, few of us may. But while our next security in choosing a sire is more speculative, we can start with a younger animal, hoping to bring him to reconized primacy before his days of profit have passed. We choose, therefore, on pedigree and individuality. Judgment differs as to which of these is most important, but nobody questions that both are very important. Again, judgment differs as to what should be the dominant conditions of a good pedigree, and as to what are the most essential features of a bull's individuality. Brothers are not always equal; therefore pedigree does not do it all. The great prize winner at the shows often fails as a sire, therefore skilled judgment of form is insufficient. Yet for pedigree we like our bull's dam to be of great dairy type and performance, and from a family famous for like character. If his dam has already produced a great sire, we like our chances vastly

better. For our bull's sire we like a tried getter of winning daughters, and all the better if his male line strings through a succession of great sires. Some of us would like the sire of our bull all the better if he is well inbred to the most valuable source of his ancestry, and bears, as an individual, the characteristic impress of that source. For the sire's dam, give us much the same sort of cow that we have chosen our bull from. No harm if she comes of the same family, but if not, let her be of a family that has previously crossed well with that of the dam of our bull.

As to individuality in the bull, I shall say less, but invite discussion. I personally want pronounced masculinity, yet divested of aboriginal grossness. The latter should disappear as the natural modification in changing from the wild to the domesticated state, and form that to specialized type. Yet there is a proneness in males to revert to early features of masculinity, against which I have more of a prejudice than a consistent reason. When I recall the striking coarseness of head, neck and shoulders of some of the Stoke Pogis bulls that prove to be sires of wonderful dairy stock, I ask myself whether, after all, a bull can be too masculine. Still, it seems philosophical that we can breed of some of this "fighting form" of the aboriginal male we mold a special type, and still retain a domesticated masculinity that will support a condition of high vitality in the breed. But I have never been convinced that because the purposes of a dairy breed are purely feminine in their functional capacity, we can safely ignore masculinity of character in our bulls. Femininity should be kept in balance, but not forced. Nature takes care of dormant character submerged by sex. No boy ever grew a heavier beard because his mother had a hairy face, but rather the reverse. No boy never failed to grow a bread because his mother's face was smooth. Yet most of and would-be experts put great stress upon feminine traits in bulls, and look to very little else in choosing them. It conforms with the best biological teaching that the masculine bull will no less surely transmit femininity from the dormant stock submerged in him, and with greater vital force back of it, than will be imparted by an effeminate bull. From constrasted parents come offsping of highest vitality, say the greatest teachers of heredity.—Hark Comstock in Country Gentleman.

COMMENTS ON VARIOUS FEEDSTUFFS.

Continued from first page)

human food to make them profitable for stock.

Squashes.—Another class of vegetables which are useful and easily grown is that of the melons or squashes. A very familiar example is the so-called pie-melon. This like the ordinary field pumpkin, can be produced readily in large quantities on most lands, and it ripens at a time when green food is likely to be scarce. (Possibly of more value is the Tsama or South African desert melon which was fully described and illustrated in the Cultivator of May 1, of this year. Ed.) All of these vegetables when fed to dairy stock produce an increased milk yield, which is more than commensurate with their actual content of food substance. This is because of their palatability, beneficial effect upon digestion, and in addition of a wholesome variety to the ration. Any o. the vegetables named may be fed with profit to swine and poultry when in confinement, and to sheep especially during the nursing period.

Silage.—One of the most economical means of preparing succulent food for seasons of drought and for supplementary feeding is by the use of the silo. It is, no doubt, generally understood that the silo, as at present constructed, is a huge tank having perpendicular walls and being made as nearly air-tight as is convenient. The usual size for the silo is fifteen to twenty feet in diameter and thirty feet high. Into the silo is put the green fodder immediately after being cut fresh in the field. The most common crop for ensilage is Indian corn, which is, moreover, the most profitable plant to grow for this purpose. At one harvest it furnishes a larger tonnage per acre than any other crop. The stalks, which if cured dry would be largely wasted, are kept in so soft a condition in the silo as to be completely eaten by the stock. Other plants, such as alfalfa, barley, oats, and orchard grass, are sometimes ensiled, but we would not recommend their general use except in seasons or localities where corn may not at the time be available, or in case they might otherwise be rendered more or less useless if cured dry; as, for example, the first cutting of alfalfa with its usual mixture of foxtail. Almost any plant grown on the ranch may be ensiled. The chief question is, what can be most profitably made the main crop for the purpose? The proof is abundant that Indian corn is the most profitable. The sorghums and sweet corn do not answer well for ensiling because of their high content of sugar, resulting in too much fermentation in the silo.

No better combination of foods for feeding cows in the stable can be imagined than alfalfa hay and corn silage, and possibly a little grain, although a fairly well-balanced ration can be made up without grain. In such feeding it is best to give hay and silage each once a day. The amount of silage per head ranges from thirty-five to sixty pounds daily, depending upon the size and appetite of the animal and upon the supply of silage. The cattle will eat corn silage at all seasons of the year, even when on good alfalfa or other green pasture; but if the supply be limited it can be most profitably fed when pastures are dry, or if the cattle should be kept off them because of heavy rains or until the grass is of sufficient size to be of value. If the dairymen will erect silos and have their cows calve in the fall instead of spring they can secure as large a flow of milk during the season when dairy products are high priced as they now have during the low prices of the spring months. Corn silage may be fed with profit to sheep as well as cattle, but not to other stock. Alfalfa silage is fed successfully to all farm stock, including swine and poultry. Horses working hard should be given such watery food in very small quantities; while those at light work or doing nothing may be fed more, and will even make profitable use of some corn silage.

Soiling.—Another method of providing succulent food is to cut the fodder green and feed immediately to the stock. This method is known as "soiling." Any of the ordinary fodder plants may be used in this way—the most common being any of the corns, sorghums, oats and peas, cereal grasses and the like. If this practice is followed the same rule would apply as in the case of silage—to raise the crop which will produce the most and best food per acre. "Soiling" presupposes that the stock are being kept in small pastures or in corrals, or at least have but little feed on their range. It also calls for more labor than is necessary if the stock could harvest their own food, but less land is required to maintain the same number of cattle than if they depended wholly upon pasturage. The matter then lies betwen soiling on the one hand with less land and more labor, and pasturage on the other with more land and less labor. With plenty of land available and labor high, we do not expect an extended adoption of the soiling method in California for some years to come. The more general the use of the silo will also tend to reduce the soiling period, because experience shows thta it is cheaper to provide green food for the year by one filling of the silo than by the daily cutting of standing fodder.

ALFALFA.

The large amount of alfalfa grown in the interior valleys of the state and its great value as a stock food render it an important element in the development of the animal industries, and one worthy of careful study and experimentation. Two factors make alfalfa of great use to the farmer and stockman—one is the large yield of pasture or hay that he can produce during the year, and the other is the high content of protein which alfalfa contains. Alfalfa hay of good quality carries so much of this important and usually costly element that a glance at the table of analysis shows that twenty pounds of hay contains as much protein as is required in the balanced ration of an ordinary sized milch cow. Almost all of the coarse fodder grown upon the ranch is relatively rich in carbohydrates and relatively poor in protein. This is particularly true of the cereal hays, straw, corn fodder and the like. With these only the feeder cannot make a good ration, but what he needs to buy is protein. He usually buys concentrated foods because of their richness in protein, and also pays for them on the basis of their protein content. Were he able to raise alfalfa or to buy it at a reasonable price, he could feed his cattle much more cheaply, and undoubtedly with as good results.

In connection with the foregoing there is given a table in the bulletin, in which is the comparative cost of protein in the various feed stuffs. From this we note that in corn which at an average would cost say $26, the cost price of each pound of protein would be 16.17 cents. In wheat bran costing say $17, price for each pound of protein is 7.6 cents. Linseed oil meal at a basis of $25 per ton, 4.8 cents per pound. Alfalfa hay at $8 per ton, 3.3 cents. Wheat hay at $9, 11.1 cents. Barley hay at $9 per ton, 7.8 cents per pound. Straw at $3 per ton 19 cents per pound. Corn silage which costs to put up ordinarily $2 per ton, gives 26 pounds of protein, which makes an average of 7.7 cents per pound.

DAIRY NOTES.

The small creamery owned by the dairyman himself seems to be increasing in popularity. We note that in the last issue of the Dairy and Produce Review that M. Isidoro has erected a small creamery near Pescadero. C. J. Murray, a large dairyman in Marin county, has established a complete creamery. L. C. Jones of Modesto has purchased a separating outfit, and will ship cream to San Francisco.

At the meeting of the Creamery Board of Trade of Los Angeles, held last Saturday, F. G. Taylor, of the Eureka Creamery, Compton, was elected president; R. R. Briggs of Hynes, vice-president; O. J. Weber, Los Angeles, secretary and treasurer.

A skimming station established at Cowells will supply cream to the Murphy and Paul, a new creamery at San Francisco.

The Woodland Creamery reports that June was the biggest month in its history.

There is more eastern butter in cold storage in Los Angeles than ever before, and San Francisco is reported overloaded. Should early rains set in the coming fall, those speculating in cold storage butter may find themselves up against certain loss.

The Glen Holly Dairy Co. have ordered through Wickson & Co., an Alpha separator, bottle filler and bottle washer, for their new plant in this city.

FOR SALE
Melia Ann and Golden Lad blood in lead. Write or come and see.
LEWIS BRADBURY - DUARTE, CALIF.

TWO THOUSAND POUNDS A MINUTE

A. R. Coulson Tells About the New Mixing Machine and Why It Had to Be Built.

The large mixing machine recently completed is something new and it took a long time and lots of expense to make it work. This is the best mixing machine on the Pacific Coast, and it works so well that no doubt that many of the other mills will copy after it.

This electric machine will mix a ton of feed in less than a minute, more evenly and thoroughly than a man with a shovel could mix it in half a day.

Although this great machine cost nearly $1000, it will make a great saving in labor which will make up for the cost of the machine in a few months. Where it cost $1 a ton to mix feed by hand labor this machine will mix it at a cost of 25c a ton.

It was absolutely necessary to have this machine, no matter what it cost, because the trade on balanced rations for poultry and stock was increasing so fast that they could not be made fast enough with six men working by hand labor. Besides, a machine like this one mixes it more thoroughly and satisfactorily than could be accomplished otherwise.

My enterprise is bringing me success. Not only am I successful myself, but those who follow my directions and use my poultry foods are successful too.

This is shown by the ever increasing trade on my balanced rations for poultry.

C. J. McCarthy says he has made more money out of his hens since he has been feeding Coulson's food for laying hens than ever before. He is well satisfied with Coulson's balanced rations for poultry.

D. H. Ward of Cotati has been feeding Coulson's balanced rations for about a year, and has had such splendid success and made his hens pay so well that many of the other poultrymen have gone to him to find out what he feeds to make the hens do so well. Mr. Ward recommends Coulson's balanced ration for poultry.

E. D. Callon of Fallon, who has about 5000 head of poultry, has used a number of tons of Coulson's' poultry foods and recommends it to be all right.

Geo. W. Gaston of Two Rock has 2500 laying hens which are paying him well. Mr. Gaston has fed about 300 sacks of Coulson's balanced rations for poultry and recommends it to be all right.

A. M. Shread, assistant postmaster at Jacksonville, San Joaquin county, writes: After having used Coulson's balanced ration for poultry I wish to say that it is all that it is recommended to be, and that really it is the best food that one can feed, and it is quite a saving on other food stuff, as it is richer and gives better results."

D. F. Colley at Downey, Los Angeles county, when sending for another ton of Coulson's egg food for laying hens, writes: "My hens are doing well now and I think Coulson's food is what makes them lay so, and I do not want to get out of it. The hens like it and it don't take much to fill them up, as it is a richer food. It costs me 50 cents a sack freight so make the price as cheap as possible."

L. J. Howell at Hollister has used over 100 sacks of Coulson's poultry foods and his hens are laying an average of 60 per cent, that is 60 eggs a day for each 100 hens.

Miss K. L. Richardson, an enterprising young lady at Malaga, four miles from Fresno, is making her poultry venture a success. Miss Richardson has ordered over 200 sacks of Coulson's balanced rations for poultry during the last four months.

S. W. Morgan, a breeder of fancy poultry near San Diego, has a supply of Coulson's poultry foods shipped by steamer every three or four weeks.

Many of the fancy breeders in Ventura and Los Angeles county now feed Coulson's balanced rations for poultry.

Mrs. Riley at Biggs, Butte county, orders ten or twelve sacks of Coulson's egg food at a time to be sent by freight.

Many other parties in Placer county, Toulumne county and Yolo county, order a supply to be sent by freight once a month.

Cnopius & Co., Santa Rosa, write: "Please quote us your lowest price on a full carload of Coulson's balanced ration for hens." This firm has already sold over 1000 sacks of Coulson's food.

Extracts from letters:

"We are entirely out of Coulson's egg food and Coulson's chick food and our customers are howling for it. So please see that our order goes forward at once by first freight."

"Enclosed find check for $168.70 to pay for last shipment of Coulson's egg food."

"Please ship at once to Germain Seed Co. by steamer to Los Angeles, 20 bags of Coulson's balanced ration egg food. There is quite a demand for it."

W. T. Park, of West street, one of Petaluma's progressive poultrymen, proved by actual experiment that Coulson's food for hens would make hens lay and grow feathers at the same time.

He bought from a neighbor a flock of 50 hens which were all run down. Their combs were black and they were a hard looking lot. He put them in a pen by themselves and fed them Coulson's egg and feather food and in two weeks they were all growing new feathers and over half of them were laying. Mr. Park uses Coulson's food right along.

There are hundreds of others that are using Coulson's poultry foods right along and are making a success of it.

Coulson's balanced ration for poultry is now on sale at most up-to-date feed stores, or if not, you can order from factory and have it sent by freight.

Zartman & Co. are building a new advertising wagon for Mr. Coulson. It is to cost about $125 and to have a low top and the inside is to be fitted up with shelves and a door on the end so this wagon inside will look like a little store. Charles Mills will have charge of this wagon and will take a four month's trip down in the southern part of the state as far as Mexico. Another wagon similar to this will be built for the northern country.

If you are not using Coulson's balanced ration, why not give it a trial and make more profit out of your poultry. Coulson's food will be as cheap as any other good feed and it will make your poultry give you double the returns on the cost of feed.

Ask your feed dealer for Coulson's food and don't let them sell you something else which they may say is just as good, because they want to sell you something that they can make more money on.

Remember it is Coulson's that you heard so much about, it is Coulson's that gives such good results, and it is Coulson's food that you want.

Following are a few items at random as samples from my daily mail and given here to show what people think of my poultry foods:

Hollister, Cal., July 1, 1903.

A. R. Coulson. Dear Sir: Please ship to me at your earliest convenience one carload, 350 sacks, Coulson's Egg and Feather Food. R. C. GURY.

The Western Union Telegraph Co.

Salinas, July 15, 1903.

A. R. Coulson, Petaluma, Cal.—Ship to W. J. Fair, Salinas, one carload, 350 sacks, Egg and Feather Food and 25 sacks Chick Food.

CHAS. MILES.

L. S. Butler writes from Los Gatos: "I have used half a ton of Coulson's Egg and Feather Food and like it very well. Will soon want more of it."

John Lants of Sacramento writes: "I have used Coulson's and other kinds of egg food, but Coulson's is the best."

Hollister, Cal., July 11, 1903.

To Whom it May Concern:

I, the undersigned, started to feed Coulson's Egg and Feather Food to 250 chickens which were moulting. At the end of ten days I found that my egg production was increased 50 eggs and am fully satisfied with said food.

H. A. Hall.

Hollister, Cal., July 10, 1903.

To whom it may concern:

I, the undersigned, have fed Coulson's Egg and Feather Food to my flock of poultry consisting of 1000 for six months and can cheerfully recommend the feed to any one raising poultry as a cheaper feed and an egg producing feed. Signed, W. K. Goff.

Calistoga, July 11, 1903.

A. R. Coulson—Dear Sir: Enclosed find $7.75 for which please send by freight 5 sacks more of your Egg and Feather Food for moulting hens. So far I am well pleased with results. Yours respectfully,

MRS. E. BANTA.

Santa Rosa, July 13, 1903.

A. R. Coulson—Dear Sir: I write to tell you I have been using your food for about a year and am well pleased with results. I have been keeping hens for over 20 years and never had them do as well as they have since I have used your food. Yours Respectfully, G. J. CUNNINGHAM.

D H. Ward, one of the most successful poultry raisers at Cotati, has been feeding Coulson's Egg and Feather Food for 1 year and has used about 200 sacks of it. He recommends it to all parties raising poultry as it proves to be the most satisfactory and economical of all feeds. Last winter when eggs were bringing 55 cents a dozen Mr. Ward had 500 laying hens that laid an average of nearly 250 egs a day, and were fed on Coulson's Balanced Ration Egg Food.

C. N. Davis says that by feeding his hens Coulson's Egg Food for two weeks the hens have doubled the egg supply and are moulting too.

$500 IN GOLD.

Hollister, Cal., July 9, 1903.

A. R. Coulson—Dear Sir: I send you today $500 in gold by Wells Fargo Express, money collected for Coulson's Egg Food sold at Hollister. Your respectfully, CHAS. S. MILES.

This Feed now for sale by over one hundred stores in California. If your dealer doesn't keep it, write for prices and have it sent to you by freight.

A. R. COULSON

772-774 Main St., Petaluma, Cal. Long Distance Telephone, Black 1303

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

WOMAN'S WORK IN THE POULTRY YARD.

ROUP.

A chapter on the sad topic of "Roup" is demanded by the following letter: As you stated in the issue of June 11th, there are many new readers of the Cultivator and there are older ones, who read your valuable writings, but lose much of their benefit by not having had some experience before hand. In the brief time in which I have been reading up on poultry, I have seen roup mentioned many times, but do not remember having seen it described.

A dozen of my young chickens have been sick for two weeks. We first noticed badly soiled feathers on their shoulders and discovered that they were wiping their eyes on them. Their heads soon became inflamed, and one, in some cases both eyes would eventually close up. None have died and the most of them have so far recovered that we have discharged them from the hospital. Will you kindly give me the name and remedy for this trouble? I think many readers of the Cultivator would like to read in its columns how to reach your poultry ranch from Los Angeles.—J. B. D., National City.

Most poultry breeders would diagnose this case as "roup." This is the name given to colds of any kind, but as in the human family there are colds of various kinds, so there are also different kinds of roup, which call for different kinds of treatment. Dr. Salmon in his learned, scientific and most valuable book on the Diseases of Poultry divides roup into simple catarrh, roupy catarrh, bronchitis, pneumonia, congestion of the lungs and diphtheria. Roup may be considered like grippe in the human family, that will run into various diseases. Diseases of fowls closely resemble human diseases, and frequently may be treated in the same way. This is a good thing to remember, because in an emergency one may frequently have in the house a "family" remedy, which will be effective if immediately applied to a sick fowl, while if no remedy were given, until a regular poultry medicine could be obtained, the fowl would be lost. A considerable proportion of cases of sickness in the poultry yard yield to very simple treatment, if taken in time; the great trouble is they are not observed soon enough, or there is no remedy at hand to give the fowl. It is possible to cure many bad cases, but the life of a well fowl is not worth much, as a rule, in dollars and cents, and the life of a sick fowl is worth considerable less. The hatchet, followed by the spade, is a quick and efficient remedy.

It is not only the cost of medicines and the value of the time spent in administering them, but the fact that a fowl once dangerously ill, with an organic disease, can never be used as breeders, because there is born in the offspring a strong tendency to contract the same disease, at the same age at which the parents had it. "Poultry Craft," by J. H. Robinson, declares that this happens so often as to justify saying that it is the rule, that among the offspring of fowls recovered from a severe attack of diphtheritic roup, that disease will become epidemic, when the offspring of fowls which never had the disease are not at all affected, though kept under the same conditions and sometimes in the same house, unless the disease is literally forced on them by contact with sick fowls.

An ounce of prevention is worth a pound of cure. Readers of the Cultivator know my rules for success with fowls. Comfort, exercise, proper food. To insure freedom from disease these three conditions are necessary. Comfort always includes cleanliness. Ninety-nine cases out of a hundred of roup can be traced to lice or mites. Cleanliness, no lice, correct sanitary conditions, good houses, well sunned and aired with no draughts, are preventions.

Quarantining all new fowls is a prevention. This is a matter of very great importance. The germs of some diseases to which acclimated fowls have been immune, often affect the unacclimated fowls, which are for a time less able to resist, and, having thus gained a foot hold, will successfully attack the acclimated fowls. The contrary also often happens. The new fowls bring with them the germs of disease, which in their old home they had successfully resisted, but which, in the new climate, are suddenly developed, and they succumb, and if the breeder is at all careless, the whole stock may become affected.

Fowls from outside flocks should be prevented from coming in contact with or feeding on the same ground as yours. Pigeons, also should be kept away. They are the worst disease carriers of any domestic birds.

Fowls that seem the least indisposed should be promptly removed from the flock and properly cared for, and as far as possible the conditions which brought the ailment should be corrected. Too often such measures are neglected until disease has positively developed.

Preventing a disease is far easier than curing it. "Poultry Craft" has the following hints to guide, in the diagnosis of the ailments of fowls, which I have found very helpful:

When a fowl sneezes, waters slightly at the nostrils and eyes, the face purs up, any or all of these symptoms indicate a common cold.

When it rattles in the throat it has a cold with bronchitis.

When it experiences great difficulty in breathing it has, probably, pneumonia.

When cankers form in the mouth and throat, it has diphtheria or diphtheritic roup.

When discharges from the nostrils are profuse and ill smelling, it has common roup, influenza. Looseness of the bowels frequently accompanies this.

A common cold neglected runs into roup, in fact roup always commences as a cold. Anything that is good for a cold, in the human family, is also good for fowls, and the dose for a mature fowl is the same as for a grown person. Homepathic aconite in the drinking water. Humphrey's or Munyon's Grippe Specific will frequently effect a cure. A two-grain capsule of quinine and half a teaspoonful of cayenne pepper is a favorite remedy of mine, rubbing the swelled head with carbolated vaseline or squirting up the nostrils and in the cleft of the palate a few drops of the following roup cure:

Two tablespoons of castor oil, one tablespoon of turpentine, one tablespoon of coal oil, ten drops of carbolic acid with a small piece of camphor gum in the bottle. Another very excellent prescription is: Mix 2 tablespoons of lard, one tablespoon of mustard, one of cayenne pepper, one of ginger and one of vinegar, with sufficient flour to make a dough, give a pellet of this the size of a hazel nut. A single dose often cures; if it does not, give another dose in twenty-four hours.

For diphtheritic roup a number of

different treatments have been successful at one time and failed at another. Most of the roup remedies advertised have been successfully used in many cases. Experienced practical poultry men do not doctor fowls which have diphtheria; they kill and bury or burn them. For those who wish to try and save their birds the following remedies are given:

(Poultry Craft.) One oz. each of oil of sassafras, Jamacia ginger, tincture of iron, alcohol, half an oz. of prickly ash fluid extract, one-fourth oz. oil of anise. Dose, a teasponful to each gallon of drinking water.

The following treatment by A. V. Meersh has been successfully used in many cases: Clean out the pus, if in the mouth, with a little spatula, if you make it bleed a little don't be alarmed. Wash the mouth out with swab of cotton batting, attached to a little stick, saturated in peroxide of hydrogen, then drop a little aristol on each sore place; repeat this operation morning and evening for three days.

A small piece of bluestone in the drinking water is an excellent disinfectant and cleanser.

A subscriber writes:

My mother has been much interested in your articles on the care of poultry, copied by the San Jose Mercury from the California Cultivator. She was especially glad to have your description of the perches which you use for young chickens. If you are willing to answer she would like to ask you some questions.

1. What lice killer do you use?

2. What kind of "tar-weed" do you use and how do you use it? There are several varieties of "tar-weed" here, but we have never heard of its being used around chicken houses.

3. How do you get rid of body lice, the kind that hide under the wings and run rapidly? Will the dipping in warm soap-suds and rinsing in a solution of chloro-naptholeum kill them?

4. How strong should the solution of chloro-naptholeum be made? Mother has used "naptha flakes" as an insecticide but has feared that this injured the chickens.

We have McFarland's directions for feeding for eggs, which has proven to be very good, and shall be glad to send it to you, if you wish it.—A. P., San Jose.

1. I use "Lambert's Death to Lice," of Buhach on chickens. Lee's Lice Killer on the perches, or paint a box or barrel with it and put them in for a few hours.

2. The tar-weed here is "Trychostema Lanceolata." I have not yet thoroughly tried it in my henneries. It is most highly recommended by a neighbor of mine.

3. By dusting with powder, and by fumigating with Lee's Lice Killer. Dipping in a solution of chloro naptholeum will kill lice. The directions are on the bottle as to how strong to make it.

Naptha flakes are too severe, make the chickens very sick. I have tried it and experimented thoroughly and had to give it up as I lost several from it. Naptha flakes can be dissolved and put on the perches.

I should be glad to see McFarland's directions for feeding fowls.

SHIPPING MARKET EGGS.

Those who send any number of eggs to market should pay attention to the packing of same so as to obtain the top market price. First of all, select all white eggs for one case, and the brown eggs for another. Select out all the very small eggs and the bad formed ones and pack them in a case by themselves. When the case contains all white eggs of a nice even size they are graded well up in quality; the same is true of brown eggs, and the small and ill-shaped eggs are graded where they belong, but when all are mixed together the whole lot will be graded about where the poorest bring them. Fresh laid eggs in winter will sell well even though they be mixed, but in the egg stores of New York, the first week in December last, fresh-laid, well-selected white eggs sold for forty cents per dozen; brown of the same quality, 38c.; mixed, 28 to 30c. This shows plainly the value of quality and selection in fresh-laid eggs. The same ratio exists all along the line. No matter if they be cold storage eggs, appearance counts in their favor, and the well selected ones of all qualities and grades bring the best prices.—The Farmer.

WHO SMILES IN THE RAIN.

The coward may smile
When there's sun all the while—
  It's braver to smile in the rain.
The weakest may joy
When there's naught to annoy—
  He's stronger who smiles through his pain.
And then when there's sun, when there's bird song and breeze,
When Gloom's put to route and Discouragement flees,
What need has the world
Of the mouth corners curled
In the cheeriest smiles, when the fields and the trees
Are smiling so broadly that nobody sees
The wee bit of brightness you're giving the while—
But days when it's rainy there's need for your smile.

The weakling may smile
When there's brightness the while—
  It's better to smile when there's rain.
The gloomster may joy
When there's naught to annoy—
  He's brave who can laugh through his pain.
When all the wide world is so full of song
That birds sing and brooklets go warbling along,
With hearts light as chaff
All the earth seems to laugh—
The sunny day courage says not you are are strong,
Though hearty good cheer one could never call wrong—
  But oh, when the day is all haggard and gray
And Nature weeps gloomily, sobbing away—
Then laugh in the hope of the sweet afterwhile;
On days when it's rainy there's need for your smile.

THE LEGEND OF THE CRYING COVE.

For two seasons the fishing off the coast of the Magdelen Islands had gone badly enough, and most of the inhabitants of the barren group had experienced the sternest hardships. To make ends meet, with many, had been an impossibility almost, and more than once whole families had been reduced to starvation point. But the sturdy men and women of the bleak and inhospitable regions never grumbled but faced their difficulties manfully, and pursued their calling, often hazardous and unsuccessful, as best they could. They had lived on the islands all their lives, several had been born on them, few had sailed more than half a dozen leagues away from their sterile homes. But all loved the place, gloomy as it was, despite the terror of the storm, the poverty of the soil and the precarious character of the living they were forced to endure. Once in a while, when matters had gone so badly that hope had died in strong men's hearts and the future looked like death, the weaker ones would say farewell to their old comrades and seek a home elsewhere, faring, perhaps, worse; but, if they did, they sent no word back to the Magdalens. At least they could keep to themselves their own misfortunes and reverses.

For two seasons, as has been said, the fishing had proved a failure; and Claude Arseneault and his Arcadian wife and children, the latter consisting of two sons and an infant daughter resolved to found a home in another place. Certainly, they could be no worse off, they thought, than they were now, and to stay longer in the old home would be madness. The schooner "Josephine" was ready to sail, and Captain X and his crew of four hardy and bronzed mariners only awaited the coming aboard of the passengers to proceed outward. It was early in the month of May when the "Josephine," stanch and trim, left Pleasant Harbor. A southeast wind prevailing, the skipper shaped his course so as to run west of the Great Bird Rocks. After clearing the Bird the wind calmed down, and instead of gaining the north shore, as he had intended, the captain was forced to obey the currents, which drifted the little vessel helplessly to the south. Toward evening the wind freshened a bit, and by midnight it was blowing a gale south by southwest. Captain X was one of the shrewdest navigators on the St. Lawrence, and knew perfectly every current and varying course of the wind in gulf and river. He had noticed the increasing dark line approaching on the calm water—a sure precursor of a storm—and had wisely stowed his sail, keeping but one jib up and double reefed.

The wheel he took charge of himself. With the coming of daylight it was hoped that the wind would subside. But fate ruled otherwise, and when the morning broke there was a high tempest raging, and the wind blew violently in a north-northeast direction. This was maintained all day, and it was quite dark when the "Josephine" found herself, in a somewhat battered condition, well up the gulf and off the Gaspe coast. When near Cape Magdalen, and about four miles from shore, the rudder chains parted. All on board realized what that meant, and every effort was made to prevent the vessel from going on shore. At this point the river is very deep and treacherous, and the anchor chains being found too short to prove effective, hope gave way instantly to despair. The honest Arcadians awaited their certain doom on their bended knees, for human help, now, was out of the question, and all knew what must inevitably follow. The little "Josephine" struggled bravely on for a while longer, but without avail; for when she was out some six miles above Magdalen River she struck heavily, and went to pieces with a loud crash. Claude, with his wife and infant child clasped in his arms, were soon parted. Stunned, bruised and bleeding, he was thrown on the beach and awoke to sensibility only when the sun was high and red in the heavens. He stood alone on the shore, the sole survivor of the wreck. Bewildered and frantic with grief he searched for his loved ones. The bodies of his sons, and those of the captain and three of the crew, he soon discovered, but wife and babe were nowhere to be seen. All day he sought among the wreckage for traces of Marie and Rita, but disappointment succeeded disappointment, and he sank exhausted at last, and tried to sleep away his hours of grief and despair. But though worn and tired, he could only doze fitfully, and, as if to add intensity to his agony, a low, moaning wail, like the cry of a suffering child, sounded constantly in his ears. A hundred times he started up and paced the beach to and fro. It was too dark to see, but he could hear; for above the roar of the wind and the loud plashing of the waves the tender, sobbing cry rose with startling distinctness. In vain Claude tried to discover the place whence the wailing came. His search was fruitless; but all night long that sad, moaning cry continued to distract him. When morning dawned some fishermen put out from Mont Louis, a small settlement a few miles away, and begged the survivor of the storm to go with them to their home. But Claude's heart was sick, and his answer at first gave them no encouragement. He could not leave his dead, he said. The storm had blown over. It was now comparatively calm, and he would look again among the debris. He tried to find the place from which the cry that had so distressed him had come, but he could no longer hear it. The men, fearing that in his despondent state he would do himself harm, pleaded with him to return with them, and after a while he consented. But he would not live in the same village. That, he had no heart to do, he said. He went further up the river, and settled along by the banks of a small stream, to which, in after years, his friends gave his name. It is still known as Claude River, and has its place on the maps.

But Claude Arsenault never fathomed the mystery that had well nigh turned his head and driven him mad. He could not go back to the spot which was associated with so much sorrow and pain. But other fishermen visited the place at times and they, too, heard the plaintive cry. They came to call it after that, L'anse Pleureuse, or Crying Cove. The superstitious among their number, and of these there were very many, used to say that on dark nights, and when there was a storm raging, the cry could be heard clearly above the blast. They said that it came from little Rita, the Arcadian child, who had been drowned the night of the great storm. All remembered the story of the wreck of the "Josephine", for it had been told far and near, and men recollected sadly Claude's fearful voice and ashy face, as he described the pitiful events of that awful night, when Rita's moaning sobs tried to guide his footsteps to her place of hiding. Some had thought the man bereft of his senses then, and they shook their heads meaningly. But, later, they had heard the moanings themselves, and it was noticed that only when the wind blew, and the storm waxed fierce, the cries swept the air and fell upon their ears. In time of calm no sound was heard. And this fact led some to make up their minds to unravel the mystery. A small party proceeded to the Crying Cove and pitched their camp under the spreading branches of a large maple tree. It was a pleasant night when

The service on these trains is perfect. The time is the fastest. The scenery most beautiful. The tourist car service appeals most directly to those who desire to travel at a high rate of speed, but prefer to economize a little on sleeping car accommodations The Southern Pacific runs personally conducted tourist excursions every day in the week at reduced rates to various points in the east, without change, via all routes. A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.

SOUTHERN PACIFIC
261 SOUTH SPRING ST.

they retired to rest, but along toward midnight a gale sprang up, and very soon it was blowing great guns. Above the din came careering along the doleful wail which had worked on the feelings of poor Claude. It awakened the sleepers, who heard the cry with varying emotions. They were not so courageous now as they had been a few hours before, and some of them were eager to leave the haunted place at once. The cry was repeated, waxing louder as the noise from the wind and the dashing whitecaps grew wilder. It sounded as if it came from a spot very near to the place where the campers sat, with blanched cheeks and starting eyeballs. Nothing could be done until daylight, however, and the more daring among them prevailed upon their fellows to wait the light of day. When the morning broke the investigators looked about them, and were rewarded by finding a clue to the mystery which had baffled so many. An adjoining tree was discovered lying on the one under which they had camped, and the bark being peeled off both, from having rubbed against each other, the friction caused by the swaying of the trees produced the cry which had so startled all who had heard it. When there was no wind there was no sound. And so the odd mystery was solved at last; but the name L'anse Pleureuse clings to the place yet, though the solemn requiem which the threes sang over the unknown grave of baby Rita has long since ceased.—Independent.

Though I were happy, throned beside the king,
I would be tender to each little thing,
With hurt-warm breast that had no speech to tell
Its inward pangs; and I would soothe it well with tender touch
And with a low, soft moan for company.
—George Elliott.

RECIPES.

Nut Sandwiches.—The most common kinds are made of English walnuts, hickory, or pecan nuts, chopped fine and mixed with one-third the quantity of chopped celery. Add sufficient salad dressing to spread easily, and place between slices of bread and butter. Another method is to chop the nuts fine and add the same amount of hard-boiled eggs, mashed to a paste, with enough mayonnaise dressing to moisten well. Chestnut sandwiches are delicious when made in this fashion: Boil the chestnuts until tender, peel and rub through a wire sieve, spread over slices of buttered bread and sprinkle with salt.

Wafer Cracker Sandwiches.—Wafer crackers when spread with grated cheese and slightly browned in the oven make delicious sandwiches to serve with salad. Candied ginger makes a nice filling for this kind of sandwich, but no dressing is to be used. Anchovy paste, strawberry, raspberry, orange, pineapple, or apple marmalade, currant and grape jelly and other sweets are used for wafer sandwiches, although anchovy paste is toothsome with bread slices. Any kind of jam rubbed through a sieve and mixed with cream makes a sandwich filling which will appeal to the most delicate taste.

Unique Sandwich.—Pound the yolks of three hard boiled eggs with 1 ounce of butter, season with cayenne, add grated cheese and salt, and pound all together. Spread on white bread previously buttered and cut into shapes. Garnish with finely chopped parsley.

Olive Sandwiches.—Cut thin slices of brown bread, butter and trim neatly. Boil two eggs until quite hard, and when cold chop them and mix finely chopped olives. Add the juice of half a lemon and whatever seasoning is desired, spread the mixture on the bread and butter and roll up ightly or cover with another slice.

Cocoanut Sandwich.—Dissolve over the fire two ounces of butter and four ounces of sugar and set to cool. To it add four ounces of grated cocoanut, one ounce of finely chopped citron, and grated rind and juice of a lemon and four well-beaten eggs. When cold spread this mixture on wafers.

TRUE.

He's true to God who's true to man; wherever wrong is done
To the Humblest and the weakest 'neath the all beholding sun,
That wrong is also done to us, and they are slaves most base
Whose love of right is for themselves, and not for all their race.
—Lowell.

HOMELY HINTS.

When poaching eggs don't forget that a teaspoon of vinegar in the water in which they are cooked makes them snowy white. Remember to salt the water. If they are dropped in muffin rings in a deep frying pan of boiling water, they will be cooked soft by standing (the covered pan removed to cool part of the range) for eight minutes. Put them on squares of buttered toast and throw a sauce over and they become creamed eggs. The sauce is made by stirring together until smooth a teaspoonful of flour and a tablespoon of hot melted butter, then away from the hot stove stir in nearly a pint of hot milk or cream. Salt to taste.

The best fire extinguishing liquid is aqua-ammonia.

Powdered borax is a harmless and exceedingly useful article to keep in the house. A tablespoonful added to hard water successfully softens it. It is an agreeable addition to the dishwater, and helps to keep the hands soft instead of irritating them as soda does.

When the fingers are stained in peeling fruits, preparing green walnuts, or in similar ways, dip them in a strong tea, rubbing them well with a nail brush, and afterward wash them in warm water, and the stains will disappear.

If the oven bakes too hard on the bottom place the grate under the cake; if too hard on top, place a pie pan of water on the grate over the cake.

To beat the whites of eggs quickly, add a pinch of salt, the effect of which is to cause them to froth rapidly.

Two apples placed in the cake box will keep the contents moist for quite a length of time.

Do not use butter for greasing pans, as the salt in it may cause the cake to stick. Use lard.

To prevent steak from burning in broiling, sprinkle a handful of salt over the live coals.

If sausages are rolled in flour before frying it will prevent breaking and also improve their flavor.

A good remedy for a burn is dry soda applied to the blister.

Clean gilt picture frames with the water in which onions have been boiled.

In storing curtains, shirtwaists, etc., always put them away rough dry, as the starch will rot the fabric.

A small piece of charcoal placed in a vase with flowers will keep them fresh for several days.

There is an ocean of difference between housekeeping and homemaking. One is a business, the other is an art. Many women make great successes in the business who fail absolutely in the art. Their houses are perfectly kept. Every department is run with care and exactness. There is never a failure to meet demand, but it is not a home. A home exists for the comfort, happiness and health of the family. There is no department of housekeeping that is not made to yield to the needs of any member. There is never a crisis of temper if a meal is late, or the convenience of a member demand a change in the hour. A few minutes—yea, even a number of minutes—spent in kindly converse in the morning, the call of a friend, or the sudden desire of an hour's outing, never seem to the homemaker a violation of the moral code. Dust does not cause nightmare, nor disorder a display which love and charity agree to call nervousness. Not things, but souls, are the objects of the homemaker's care. She values peace more than system, happiness more than regularity, content more than work accomplished. Yet, with all, her house, when she touches perfection, is the essence of regularity, order and quiet. It is this that makes homemaking an art. And she alone is a homemaker who has a true sense of proportion.—The Outlook.

We needs must love the highest when we see it. —Tennyson.

Qualified.—"What do you intend to do with your boy, Tom?" "I'll try to make him editor of a daily newspaper." "Good! Has he shown any literary tastes?" "No, but I've never known him to be satisfied with anything in his life."—Puck.

Our doubts are traitors.
And make us lose the good we oft might win,
By fearing to attempt. —Shakespeare.

General Summary.—Clear weather prevailed during the wek in the interior districts and foggy or cloudy weather in the coast districts. The temperature was slightly below normal in all sections, but conditions were generally favorable for all crops.

Harvesting, threshing and hay baling are progressing rapidly. In Southern California the yield of wheat, oats and barley is reported the heaviest for several years and the grain is of excellent quality. The hay crop in that section is also very good. In the central and northern districts the barley crop is not quite up to the average, but is considered very fair; early wheat is turning out much better than expected a few weeks ago, and in many places is about average. Late wheat is improving, especially along the coast, and there will be a small crop in some sections. Sugar beet harvest is in progress and the factories have commenced operations; the yield is reported good. Beans, corn and vegetables are doing well, but hops are not in satisfactory condition.

Fruit drying is progressing in all sections and large shipments of the dried fruit are being made. A good crop of apricots has been gathered in some places but the yield is generally below the average; the fruit is of better quality than usual. Other deciduous fruits are maturing and going to market; the yield will probably be about average. Grape prospects continue excellent in all sections, and a heavy yield of raisins is expected. Oranges and olives are doing well.

NOTES FROM SECTIONS.

Sacramento Valley.—Peaches are ripening and Tuscan clings are nearly ready for picking. Tragedy prunes are being gathered at Palermo. Pears are being shipped in considerable quantities and the crop will be large. Large shipments of dried apricots are being made from Colusa county. Grapes are in excellent condition and a heavy crop is probable.

Coast Counties.—The grain crop is being rapidly harvested and thrashed, and is nearly average in most sections, though a few places report a light yield. Hay baling is progressing. Corn, beets and beans are in good condition. Nearly all deciduous fruits are yielding excellent crops. Apricot drying in in progress; the yield in San Benito county is better than expected. Grapes continue in splendid condition and large crops are looked for. Apple trees heavily loaded.

San Jose Valley.—Grain is going to warehouses in large quantities. A small amount of the third crop of alfalfa is being cut. Fruit cutting and drying are progressing. Large quantities of peaches and pears are being shipped to eastern markets. The watermelon crop is large and of good quality. Stock healthy and in good condition. Streams falling fast.

Southern California.—Beet harvest is progressing and the sugar factory at Santa Maria has commenced operations, with an excellent crop to work on. Apricot drying is in progress; the fruit is of superior quality, but the yield is light. Other deciduous fruits and oranges are doing well. Grapes are in good condition and will yield heavily. Honey crop not as large as expected. Corn best in years.

Fauntleroy on the Birth of the Diamond.—L. L Fauntleroy: "Dearest, don't jewelers set big diamonds?" Mrs. Fauntleroy: "Yes, Cedric." L. L. Fauntleroy: "Well, dearest, do the big diamonds hatch out little ones?" —Jeweler's Weekly.

Go on in all simplicity; do not be so anxious to win a quiet mind, and it will be all the quieter. Do not examine so closely into the progress of your own soul. Do not crave so much to be perfect, but let your spiritual life be formed by your duties and by the actions which are called forth by circumstances.—Francis de Sales.

Self-reliance, self-restraint, self-discipline, these constitute an educated will.—James Freeman Clarke.

DOWN BY THE SEA!
A day spent on the warm sands at the seashore imparts to the mind, as well as the body, new life, new hope, and to the city weary a day of peaceful rest and quiet. The most delightful and only clean, sandy beaches are those of Long Beach and Terminal Island. Here you can lie in the warm, soothing sands and dream the hours away, or you can dig clams, gather beautiful shells and sea mosses and have a good time playing in the surf of the sea as it rolls shoreward. Agents of the
SALT LAKE ROUTE
will give you full particulars and furnish illustrated leaflets.

Los Angeles Markets.

Los Angeles, July 23.

Eggs have taken a half cent advance and fresh ranch eggs are quickly cleaned up.

Potatoes are quoted at slightly higher than last week, at the same time the market is decidedly off. This is caused by the vast amount of indifferent stock which seems to be in the market this year. The first class stock readily commands top quotations.

Watermelons are now plentiful in the market, with prices much lower than last week, at the same time the market is firm. Cantalopes seem to be in limited supply, and hold very firm. Selling up to quotations.

Cherries are still in the market, but these of course, are all brought out of cold storage.

SAMSON IRON WORKS STOCKTON CALIFORNI

San Francisco Markets.

Dairy.

San Francisco, July 23.

The receipts of coast butter have fallen to about one-half what they were a month ago. Then about 70,000 pounds per day was the average. Now 30,000 to 35,000 is the amount. This is caused by the shortage of pastures in all the coast. The market has advanced a cent to a cent and a half since last week, and is of a firmer tone. This is especially true of fancy stock. Indifferent stock goes begging, at least it will not command full quoted prices. There is a vast amount of eastern in cold storage, which is now being continually drawn on.

BUTTER—Per lb:

Creamery extras	27	@27½
Creamery firsts	25	@26
Creamery seconds	23	@24
Dairy extras	23	24
Dairy firsts	21	22
Store	18	19

CHEESE—Per lb:

Cal. Creamery, mild new, extra	14	@15
Cal. Creamery, mild new choice	13½	@14
Young America	14	15½
Eastern, New York Cream, Cheddars and flats	18	@19

Eggs and Poultry.

Receipts of Eggs show a marked falling off and the market continues firm, although, owing to the present high prices, buyers are cautious. The top quotation is generally an extreme, but small sales of extra large whites are recorded in some instances as high as 27c. The cheaper Eggs are steady in sympathy.

EGGS—Per doz:

Ranch, selected large	26	
Ranch, good to choice	24	@25
Store	19	22
Eastern	17	@20

Abundance of eastern stock has depressed the poultry market, which is far weaker than last week. Already this week three cars of eastern poultry have been received. Young plump stock commands quoted prices.

POULTRY—Old Roosters, per doz., $4.50@5; young Roosters, $6@8; Fryers, $3.50@4.50; Broilers, large, $3@3.50; small, $2@2.50; Hens, $4@5; Ducks, per doz., old, $3@3.50; young, $3.50@4.50; Turkeys, nominal; Geese, per pair, $1.25@1.50; Goslings, $1.25@1.50; Pigeons, per doz., young, $1.50; do, old, $1.50.

Fruits and Vegetables.

The receipts of deciduous fruits has continued up to the standard during the past week. Prices have been well maintained with no pronounced fluctuation. Peaches are arriving freely, the favorite being the yellow variety from the interior. Many, however, are green, unattractive fruit, seldom commanding maximum quotations. The clean, ripe stock is quickly taken, however, at prices often in excess of quotations. Bartlett pears are improving in quality and in demand. Stock suitable for immediate consumption is freely taken by retailers at improved prices. Apricots are in light demand, and but few sold above canners' prices, although some exceptionally fine stock in baskets, commands maximum quotations, given below. Apples are shading slightly in prices, and much finer stock has been received. Some extra fine stock commands prices above quotations. Plums and prunes are in full supply, and the prevailing prices are easy and unsteady. Some bulk lots have sold as low as $17.50 to $20 per ton. Watermelons are coming in from the interior, and have shaded materially in price during the past week. The present indications are of no more immediate slump in prices. Canteloupes are still declining. Nutmegs equally weak. Nectarines are the latest favorite, and do not command very high prices. The receipt of berries has been ordinary. Espcially fine lots command high prices. Citrus fruits are in very slight receipt with vary small demand. Lemons are very weak, and limes offered below quotations.

DECIDUOUS FRUITS.—Apples—Per box, common to choice, 50@85c; fancy, $1@1.25; Crab Apples, per box, 30@60c.

PEACHES—Per box, 35@65c; basket, 50@75c.

PEARS—Per box: No. 1 Bartlett, $1@1.25; common, 40@75c; bulk, per ton, 25@32.50; other varieties, 30@60c; basket, 25@50c.

PLUMS—Per box or crate, 25@60c; basket, 25@35c, according to variety.

CHERRIES—Per box, nominal.

PRUNES—Per box or crate, 40@65c; basket 40@60c, as to variety.

FIGS—Per box, 25c@$1.

APRICOTS—Per box or crate, 40@65c; bulk per ton, $25@35.

CANTALOUPES—Per crate, $1.25@2.

NUTMEG MELONS—Per box, 75c@$1.50.

WATERMELONS—Per 100, $5@20.

GRAPES—Per crate, Seedless, $1@1.50; Blacks, 75c@$1; Fontainbleau, 50c@$1.

NECTARINES—Red or White, per box or crate, 50@85c.

BERRIES—Per chest: Strawberries—Longworth, $6@8; large varieties, $2.50@2.75; Blackberries, $2@4; Raspberries, $3.50@6; Logan Berries, $2.50@4; Huckleberries, per lb, 10@12½c; Currants, per chest, $4@6.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, $1.75@2.50, as to quality; Valencias, $1.75@$2.75; St. Michaels, $2@2.75; Seedlings and Mediterranean Sweets, $1@1.50; Lemons, $1@3; Grape Fruit, $1@2; Limes, $4.50@5.

Vegetables are in better receipt than heretofore this season, but the demand is not strong. Thre is a heavy over supply of both summer squash and cucumbers, and market on this product much shaded. Tomatoes are easy, while fancy lots command top quotations. Green chillis have continued the low prices, and are very plentiful. Green corn received in abundance, though the demand cleans up the market quickly. Potatoes are slightly steadier under lighter receipts, but there is no material marking up of quotations.

VEGETABLES—Asparagus, per box, $1@2.25; Tomatoes, per box or crate, 40@65c; do, river, large box, $1.25@2; Green Peppers, per box, Bell, $1.25@1.75; Chile, 75c@$1; Dried Peppers, 6c; String Beans, per lb., 2½@4c; Wax, 2½@4c; Liman Beans, 7@8c; Green Peas, per lb., 3@4c; Egg Plant, per box, $1@1.50; Summer Squash, per box, 40@75c; Cucumbers per box, 40@65c; Garlic, per lb., 2@3c; Green Corn, per sack, $1@1.50; crate, $1.25@1.75; Okra, per box, 65@90c.

ONIONS—New Silver Skins, per ctl., 50@70c.

POTATOES—Per ctl.: New Whites, per box, 55c@$1.50; per sack, 60c@$1.10; Early Rose, 75c @$1; Garnet Chile, $1@1.15; old Oregon Burbanks, $1.25@1.50.

Regarding the local prune situation the San Francisco Chronicle says:

Dried Fruits, Nuts, Etc.

The interesting feature in the Dried Fruit market at present is the sharp competition of both local and Eastern dealers to close contracts with foreign buyers of Prunes for October delivery. The Eastern operators are offering to deliver new crop stock by October 1st at about the quoted basis prices, while the local brokers demand the maximum quotation and until the end of the month for delivery, claiming it impossible to deliver new stock before that time. The foreign buyers have taken some note of the latter claim and are now skeptical in closing deals with the Eastern dealers, fearing they will substitute old-crop stock on them. The German steamer Herodot, sailing on Friday for European ports, will carry some 200 tons of old prunes of small size for various foreign markets.

In other new fruits business is still slow and uninteresting. Apricots are claiming but little attention and the small lots of spot stock now offering meet with a purely jobbing sale. Honey is very scarce and rules firm at full figures. General prospects are for a small crop and high prices this season.

DRIED FRUITS.—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1902 crop are, per lb., as follows:

Apples—Evaporated, 4@6½c; Sun Dried, 3@4c.

Apricots—Royal, choice to fancy, new, 6¾@8c; old, 6½@7c; Moorparks, choice nominal.

Peaches—4¼@6½; peeled, in boxes, nominal.

Pears—4¾@9½c.

Plums—Pitted, 4½@6c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 2¼@2½c, with ½@1c premium for large sizes; new crop, 2¾@3c.

Nectarines—Whites, 4@5½c.

Figs—White, 5½@6c; Black, 5c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1902 crop: Loose Muscatels, 50-lb boxes, per lb., 2-crown, 5½c; 3-crown, 5¾c; 4-crown, 6c; Seedless, loose Muscatels, 5c; London Layers, 20-lb boxes, per box, 2-crown, $1.40; 3-crown, $1.50; fancy clusters, 4-crown, $2; Dehesa, 5-crown, $2.50; Imperials, 6-crown, $3. These prices are subject to change without notice. Seeded, f. o. b. at Fresno, per lb.: Fancy, 16

NUTS.—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Pecans, 11@12c; Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c; Chestnuts, Italian, nominal.

HONEY—New Comb, per lb., White, 14½@15c; Light Amber, 13½c; Extracted Water White, 6½c; Light Amber, 6c; Dark Amber, nominal.

BEESWAX—Per lb., 32c.

Live Stock.

Moderate supplies and a low but steady demand continue the characteristic features in the local Live Stock market and previously quoted prices are well maintained for the various kinds of offerings.

Quotations are:

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 7@7½c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@8½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES.—Light, per lb., 5@5½c, gross weight; heavy, 4½@4¾c, gross weight.

SHEEP—Per lb.: Fat Wethers, No. 1, 4@4¼c, gross weight; Ewes, No. 1, 3¾@4c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb. live weight.

HOGS—Per lb: Hard grain fed, weighing alive 140 lbs and over, 6¼@6½c; weighing under 130 lbs, 6@6¼c; weighing 260 to 350 lbs, 5½@6c; rough, heavy, 5½@6c.

Hay and Feed Stuffs.

HAY—Prices on new Hay, per ton: Wheat, $10.50@13; Wheat and Oat, $10@12; Oat, $8@$11.50; Barley, $8@10.50; Clover, $8@10; Alfalfa, $9@10.50; Stock, $8@9.

STRAW—Good to choice, per bale, 45@60c.

FEED CORN MEAL—Choice grades, per

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50.

ton, $29@30.50.

GROUND BARLEY—Per ton, $22@23.

MIDDLINGS—Per ton, $27@30.

RICE MEAL—Mill price, $18 per ton.

BRAN—Per ton, $24.50@25.50.

CRACKED CORN—Choice quality, per ton, $30@31.

COCOANUT CAKE—Best quality: In lots of 10 tons and upward, $20 per ton; 5 tons, $20.50; small quantities, $21.

BEANS—Prices per ctl.: Large Whites, $3@3.15; small do, $3.15@3.30; Pea, $3.25@3.50; Lima, $3.45@3.60; Red, $2.90@3; Pink, $3@3.10; Bayo, $3.65@3.75; Blackeyes, $2.75@3; Red Kidneys, nominal.

Cereals.

WHEAT—New crop: No. 1 Shipping, per ctl, $1.38¾@1.40; choice, $1.41¼@1.42½; White Milling, good to choice, $1.47½@1.50.

BARLEY—New crop: Choice No. 1 Feed, $1.01¼@1.05; Shipping, $1.10@1.17½; Brewing, No. 1, $1.13¾@1.17½; Chevalier, nominal.

OATS—Feed, good to choice White, $1.22½@$1.32½; White Milling, $1.32½@1.37½; Red, $1.15@1.25; Black, $1.12½@1.17½.

RYE—Good to choice, per ctl., $1.10@1.15.

CORN—Good to choice, per ctl.: California, new, large yellow, $1.40@1.45; small, do, $1.65@$1.70; White, $1.40@1.45.

Hops.

The prices for new crop are 18 @20c per lb, according to quality.

Eastern Markets.

New York General Market.

CHICAGO, July 22.—The effect of yesterday's bullish government report stimulated the opening in wheat and caused some early strength. September was a shade lower to a shade higher at 76¼@76⅝, and sold up quickly 76⅞. On the advance, however, the pit traders sold freely, and support was lacking. The result was an easing off in prices, which was furthered later in the session by the unloading of long lines and by selling orders from St. Louis. September went down to 75⅝, where commission houses checked

the decline and carried the price back to ½ to ⅝c, the closing figures being 75½@75¾c. There was a good country and commission house demand for corn early on increasing reports of uneven crop, and the market showed strength. September closed steady with a loss of ⅛c, at 49⅞c, after ranging between 45⅝ and 50⅛c. Trade in oats was largely local, and prices were somewhat better. A continued support by local bulls on unfavorable crop advices saved the market from a severe break, and the close was at a gain of ¼c for September, at 32⅝@32¾, with a range for the day from 32½@33⅛.

Cash quotations were as follows: Flour was steady; No. 2 red wheat, 75@76⅛; No. 2 corn, 49¾; No. 2 yellow, 50¼; No. 2 oats, 39½; No. 2 white, 38; No. 3 white, 49¼; No. 2 rye, 52@53; good feeding barley, 42; fair to choice malting, 46@50; No. 1 flax seed, 90; No. 1 northwestern, 95½; prime timothy seed, 2.85; mess pork per bbl., 14.05; lard, per 100 lbs., 14.10; short ribs, sides (loose), 7.77½@7.80; dry salted shoulders (boxed), 8.12½@8.30; short clear sides (boxed), 7½@7⅝; clover, contract grade, 12.00@12.50.

Grain Movements.

Articles—	Receipts.	Shipments.

Sheep—Receipts, 18,000; sheep steady, 10c higher;; good to choice wethers, 3.75@4.10; fair to choice mixed, 3.00@3.75; western sheep, 3.25@4.25; native lambs, 4.00@6.35; native lambs, 4.00@6.35; western lambs, 5.50@6.00.

California Dried Fruits.

CALIFORNIA DRIED FRUITS.

NEW YORK, July 23.—The market for evaporated apples is quiet, and prices are without material change. Common are quoted at 4@5½; prime, 5¾@6; choice, 6¼@6½; fancy at 6¾@7½. Prunes are unchanged, ranging from 3@7c for all grades. Apricots are steady to firm; choice, 7¾@8½; fancy, 10@12½. Peaches are steady; choice, 7@7½; fancy, 8@10½.

CITRUS MARKETS

ORANGE MARKET.

The market the past week in Eastern auctions has been cleaning up the last of the heavy shipments and is showing a steady front with higher prices, especially for fancy, sound stock, but there is little life in trade on the heavily decayed, poor quality seedlings and sweets. The suplies in sight are extremely light and should stimulate prices on anything desirable. Fancy Valencias are in demand at very satisfactory prices for this grade.

Trading in the West has been light but at fair prices, anything in good quality, seeds and sweets, having the preference on account of prices being considerably lower than Valencias. The volume of fruit being handled is not large, as might be expected at this times of year, with a large amount of deciduous fruit being handled.

LEMON MARKET.

Lemons have remained fairly firm at satisfactory prices especially in West, but cooler weather is having the usual effect in some sections and the West is not able to take all Calinias en route. Prices on foreigns have remained fairly firm on good stock, especially 300s. The last of foreign shipment for the season as usual showing heavy run of 360s and smaller.

Shipments of citrus fruits from Southern California for the season, from November 1, 1902, to date are 20,743 carloads, of which number 2270 carloads are lemons.

NEW YORK, JULY 16.

A. C. G. Fr. Ex., Red Shield Valencias, 5 per cent decay, $2.90.

O. K. Fr. Ex., Quail navels, $1.70. Owl navels, 15 per cent decay, $1.65.

C. U., Riverside, Turquoise seeds, 15 per cent decay, $1.60.

C. U., Riverside, Our favorite Mikes, 5 per cent decay, $3.00. Snowball Mikes, 7 per cent edcay, $2.55. Our Favorite Sweets, 1 per cent decay, $2.40.

C. U., North Pomona, Lilac seeds, 35 per cent decay, 80c.

C. U., Lindsay, Amethyst Valencias, 10 per cent decay, $1.60.

C. U., Pomona, Peacock Valencias, 15 per cent decay, $2.45. Lilac seeds, 20 per cent decay, $1.30.

BOSTON, JULY 16.

Market weak.

C. U., Riverside, Daisy sweets, 10 per cent decay, $1.60.

C. U., Redlands, Clover Valencias, $2.40.

C. U., Riverside, Daisy sweets, 15 per cent decay, $1.60. Extra Choice Mikes, $2.40.

Riverside Fr. Ex., Blue Globe seeds 20 per cent decay, $1.60. Red Globe seeds, $1.45.

PITTSBURG, JULY 17.

Market on oranges steady. Lemons stronger and advancing.

QUALIFICATIONS OF A DAIRY COW

BY MRS. MINNIE E. SHERMAN OF FRESNO

Scientific dairying, as to the feeding of the cow and the handling of her product, has been the outgrowth of the specialized work of the dairy school experts. While the creamery man, with his manner of paying as little as possible for what the cows produce, has made the dairyman take out his pencil and learn to figure exactly what the cows do earn; so he has, by calculating, brought the keeping of the cows down to a business basis.

The first historical mention we have of the importation of cattle is that they were brought by the Europeans to Mexico about the year 1525. The mild, equitable climate and the abundant grass covered ranges caused them to multiply rapidly, and they soon covered not only the plains of Mexico, but those of Texas and California, with their offspring.

The first improved cattle came to Virginia from Holland in 1625, and were of beef and milk form. The oxen were powerful animals, plowing the new lands, while the cows furnished a small amount of milk for the settler's family. The first cows used solely for milk were brought from Normandy to Quebec by the French emigrants. It is said that these yellow, dun and silver gray Normandy animals enter largely into the foundation strains of both the modern Island Jersey and the brown Swiss cattle. They were of medium size and gave a fair quantity of milk, while the oxen were large enough for plowing in a hilly country, like Canada and New England.

However, the dairy cow was, as yet, of little value in the eyes of the farmer, for as late as 1825, at a Massachusetts county fair there was no class for cows or for butter or cheese; but there was the surprising entry of 100 yoke of oxen competing in feats of strength and docility. I wonder if there were some old men there to croak at that county fair as an ox show, just as we croak today that our fairs are mere race horse matinees.

The beef strain is very hard to breed away from; even in the fifth and sixth generations of cows it often crops out when cows are fed for heavy milk production. Many a good grade cow has slipped off into beef when 5 or six years old, causing a loss—for it does not pay to fatten a beef on dairy rations. When we consider a good cow should produce 350 pounds of butter, worth, say 25 cents a pound, or $87.50 in a year, it is indeed, killing the goose that lays the golden egg to sell her for cow beef at $30 to $40. You see, we do not believe in the general purpose cow, though it may seem presumptious, for she has prominent advocates but then, "seeing is believing," and we have never seen one.

Now, in selecting a cow for dairy use, one of the principal points is the stomach; it should be large and somewhat pendant—never set flush with the backbone, but always leaving a ridge. The stomach should suggest that the digestion is ample, and that the consumption of food can be pushed heavily, and yet a margin of reserve force remain, for the drain from the heavy milk flow should be urgent, and her appetite constant if she is to continue in profitable milking for the entire year.

Draw an imaginary line directly across the cow's body in front of her udder. First of all, notice if ample breeding power is indicated by the width of her pelvis. The hips should be high, the thighs wide and encurving well; a strong, rugged backbone, with a distinct rise at the rear, so as to make the animal taller at the rump than at the shoulder. This rise should be gradual, and in improved breeds is rarely a rough, disfiguring hump. The tail should be long and slender and set high enough to carry out the high line of the pelvic arch. She should be thick through in front of the line to give ample room for heart and lungs. with a large navel and well developed milk veins, with a skin soft and full of oil. The head and neck should be fine and feminine, the breast without brisket or dewlap. The eye clear, prominent and full of gentle intelligence, while the under jaw should be strong and rather short. The spare hind quarters of the dairy cow have grown lighter and lighter in the years past.

The teats should be well placed and of convenient size and shape, neither too large nor too small, and far enough apart to be easily milked dry. The two small rudimentary teats behind the four regular ones are a good indication for milk continuance in a cow. The Swiss say that they indicate a cow will transmit her quality as a milker to her offspring.

The elaboration of milk by the cow is a physological mystery about which little is definitely known. The alliance between blood supply and the milk shows, however, to have a copious supply of milk, there must be a correspondingly generous supply of blood. The blood flows from the heart to the udder, and passes into the milk veins, and back through the milk wells, near the forelegs into the body, returning again to the heart and lungs. The milk veins show by their size and engorged condition the amount of blood they carry. The milk wells should be large enough to admit easily the second finger of a man's hand.

The front part of a cow's udder is often less well developed than the rear portion. Here is a loss in milk greater than is commonly recognized. Some years ago Prof. Plumb found in 13 cows deficient in the fore part of their udders, that the hind teats gave 57 per cent more milk than the front ones.

As to how long a cow should be retained in the herd, each must decide for himself; but I am satisfied that many people sacrifice their cows by selling too soon, as they are afraid the cow will become too old for the butcher. I have kept many cows until they were worthless for beef and thought that it paid rather than to lose a year or two of good milk. The mature cow has outgrown the likelihood of milk fever and garget, and has shown she possesses good lungs and a good digestion and that her disposition is good. We have had cows eighteen years old that made 350 pounds of butter in a year. By the records of 486 cows kept for seven years, the age of greatest profit in a cow's life is from six and a half to fourteen years old. The Holland government tested a large number of cows to find at what period of cow's life the milk contained the greatest amount of butter fat. The period was fixed as from the seventh to the eighth years, and that in a healthy, well fed cow the milk capacity increased up to the twelfth year, the flow remained stationary until the fifteenth year, when it usually decreased until the cow became farrow.

The selection of a pure bred sire to head a grade herd is wise.

This sire should be a good individual, strong in his race type, with a backbone as rugged as the ridge of a continent, without brisket or dewlap; a distinctly masculine head, with a good, mellow skin. He should show rudiamentary teats and dairy form in his rear conformation. It is important, though often overlooked, that the dam of this sire should have a perfectly formed udder—for form of the udder is strongly transmittable, and each breed has a type of its own. The sire should have a lively sense of his own importance, and not be willing to be imposed on by rough handling. He should fight if cornered, for the gentle bull rarely imparts grit to the offspring, and endurance seems to be founded in temper. Listless, flabby people are amiable; so is a listless, inert bull. The very word, bully, should indicate his character; he should be ready to bluster and fuss at any infringement of the rights of his harem. It is better for the head of a grade herd to be a strong, typical individual than one whose dam is a phenomenal, record-breaking cow. There are many fine bulls sacrificed to the idea that nature will permit sudden great elevations of quality. Now, quality must be backed by the physical health of the animal; so, if we push quality before conformation, or correct form has been built up strongly, we are apt to lose health. Milk production is a heavy strain, and the animal must not only be physically educated herself to stand it, but must have inherited the acquired constitution from her dams.

Each sire used in breeding the herd should be more refined in type than his predecessor. We believe in each generation having fresh blood introduced, and do not believe in incestuous inbreeding.

Herd of Holsteins showing the famous cow Fidessa, raised by Mrs. Sherman; now the property of the Pierce Land and Stock Co.

FARMERS' INSTITUTES.

One phase of the work which the State University is doing in the interest of agricultural development of the state is giving a fine attraction at the little seaside town of Long Beach this week.

A farmer's institute, nothing more To many farmers, very many, that is meaningless, utterly so, never having attended and knowing nothing of its worth or otherwise. They have a vague idea that its some kind of a "meetin where the college fellers come and air their book larnin." But of course there is no interest in it for them. This is the case with many, nearly all the farmers about Long Beach. At one of the best sessions Prof. Cook, asked a show of hands of all Long Beach people, just four hands went up. Four people appreciated the treat freely given to them enough to come and listen. Many others traveled miles to the treat.

"But Long Beach is a resort and not a farming section!" But it is decidedly a farming community. Hundreds of productive little places within trading distance. Beautiful farm homes, berry fields, orchards, and dairies.

And four of them attended, That was early in the week. Later as it was noised about what they were missing the room filled up with an appreciative audience.

Six days of solid meat is giving those who attend a strong diet which it may take time to thoroughly assimilate, yet it will accomplish great good, directly to those attending, also to others who will get the inspiration at second hand.

Regarding the worth of the institute, we wish to quote from a speech of Prof. Latta of Indiana, made at Toronto, Canada, recently:

"The farmers' institute is but one of the many agencies for diffusing a knowledge helpful to agriculture. It has, however, a distinct place and a definite work. Agricultural papers widly disseminate this information, but it comes in cold type to many who have difficulty in understanding the printed page, and with no opportunity for questions and answers, which is so characteristic of the well conducted farmers' institute."

This question feature, was most prominent at Long Beach. The informality of it all brought the audience into close touch with speakers, and question after question is passed until a thorough understanding is reached.

Our legislative bodies should provide ample means for the organization and effecive maintenance of the work, and all who are responsible for the management of farmers' institutes should not only seek to secure intelligent, well balanced, thoroughly trained and effective speakers, but they should be ever really to employ the most feasible and effective methods of projecting and conducting the institutes.

For the first time, California institutes are supported with money, appropriated by our state legislature. Heretofore the state university has drawn from its funds to its injury. The last session appropriated $12,000 for this purpose, for two years. There are approximately a hundred institutes held each year. One-third about, of these are south of Tehachapi, under Prof. Cook's direction, and two-thirds, are north of Tehachapi. All are under the oversight of the state university with Prof. E. J. Wickson, as director.

The more effective work which the appropriation has made possible, should encourage to the continuation of the appropriation or its increase.

BENEFITS OF IRRIGATION.

Prof. E. J. Wickson of the State University is seeking for information as to the benefits of irrigation, to be incorporated by the U. S. Department of Agriculture into a report, which should be of great value to all on the Pacific coast. Prof. Wickson deems the best irrigation that which is secured from practical irrigators of experience. To secure that he has sent circulars and questions to irrigators over the coast to gather in the desired information. To give an idea of the scope of this work, we quote:

"I have undertaken to prepare for the U. S. Department of Agriculture an account of the advantages of irrigation in fruit growing on the Pacific coast. I wish to secure facts and conclusions from those who have experience and observations both with and without irrigation so that comparison of results by each method may be made.

The present plan is to collect information as to results in the amount, character, quality and market value of fruit produced by irrigation. The enclosed sheet of questions is merely to suggest lines of fact and judgment, which seem pertinent. You are hereby requested to either frame answers to these or to give facts in your own way as to whether you find irrigation an advantage or not and how this is shown in the product.

Photographs showing trees or fruits grown with irrigation and those for which no irrigation is used are earnestly desired in order that many significant pictures may be used in the report.

"Can you give weight or measure of the product of a single irrigated tree, or vine, or per acre? Compare with non-irrigated. Is there any difference in regularity of bearing? How do irrigated and non-irrigated fruits compare in size, flavor, aroma and general appearance? What has been your experience in shipping irrigated fruits or in selling to shippers? What has been your experience in canning irrigated fruits, or in selling to canners? What has been your experience in drying irrigated fruits, or in selling to driers? Has your irrigated fruit won prizes or awards at fairs or expositions? If so, when and where? Do you know of fruits or fruit trees or vines being injured in any way by irrigation? If so, in what respect?"

The Santa Ana "Leader" asserted that one of the greatest industries of that county is the Lima bean product. There are thousands af acres of beans, some of the largest being upon the great San Joaquin ranch. Ventura and other counties to the north better look out.

Raisin growers of Los Angeles and San Diego counties report one of the biggest crops of raisins ever promised.

EDITORIAL NOTES.

It is really gratifying to note the unanimity of both press and pulpit the country over in doing honor to the memory of Pope Leo. These expressions come from people of all beliefs, many of them at greatest variance with that of Pope Leo and his adherents. This shows a vast difference over that of a few years ago when a more intolerant spirit prevented many from seeing the good in those who did not believe as they did. The world does progress in its being tolerant and considerate of others, as well as in material growth.

The rigid ordinance passed by the Palo Alto authorities, as a result of the recent fearful scourge of typhoid fever, caused by the selling of milk from dairies in which disease lurked, while rather stringent, is only what every city should enact. The board of health is to make examinations of all dairies, grant licenses, where the proper conditions have been made. No one can sell milk without this license. The milk must be pure, unadulterated, and from healthy cattle. And there must be absolute absence of all communicable disease, both from those employed in the dairy and all those in the neighborhood. All diseases must be reported at once. A heavy fine and imprisonment will doubtless be meted out to the first violator of that law.

Farmers should bear in mind that any fruits or farm products of exceptional merit should be preserved and furnished to the committee in charge of the St. Louis exhibition. Messrs. Wiggins and Filcher are sparing no pains to make a magnificent showing for California this year. What they want is not freaks in the line of products, but fine perfect specimens.

W. A. Butterworth of Pasadena has been sued for damages because of the giving away of a small dyke, which he had erected to deflect storm water from his ranch to the street gutter. It was charged by the plaintiff, Mrs. Anna Austin of Pasadena, that the break released a quantity of water which, after crossing his land damaged hers to the extent of $299. The case came before Justice Klamroth of Pasadena, who awarded damages according to the request of the plaintiff. These ranches are both on hillsides above Pasadena, and the effort of Mr. Butterworth which proved so disastrous, may deter others from attempting to control storm water, if damages are to be awarded in case of failure of attempt. We understand Mr. Butterworth is to appeal the case, which may possibly secure a reversal of the lower court.

Since our recent reference to silos and to various feeds, we have had conversation with Geo. E. Platt, a Jersey breeder of this city, and it develops that Mr. Platt was one of the first to use silos. The silo was first used in France, and it was not known in this county until 1871, when a man by the name of Brown, translated a description of the silo for an eastern farm newspaper. J. M. Bailey, of Billrieca, Mass., saw this article and proceeded to build a silo, and make a test of the worth of this plan of preserving feed. Mr. Platt, at that time lived in Suffield, Conn., and his brother learning of it, went to see the manner of construction, and at once came home, and a silo was built in the side hill. The feed was then placed in the silo and Mr. Platt thinks his feeding preceded that of Mr. Bailey's by four or five days. It is also probable that Mr. Platt was one of the first to feed silage in California. He came here in '81, and thinks it was but a short time after that, when remembering the worth of this excellent feed when in the East, he first used a couple of cast off oil tanks for silos.

C. B. Boothe has returned to Los Angeles from New York after a few months spreading the gospel of irrigation and its benefits to the country at large. Mr. Boothe reports that the eastern merchants and manufacturers are realizing more than ever the great development which awaits the arid west, which may come from government aid to irrigation.

The Central Beekeepers' Association recently met at Hanford, and decided to send delegates to the National Convntion to be held in Los Angeles, August 18-20th.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

NEW FRUIT AGENCY.

Last week the Cultivator presented a copy of the agreement through which it is hoped by the prune growers of the north to effect a co-operative selling agency. Below will be found the contract under which it is proposed to operate:

CONTRACT.

This agreement, made this..... day of....., 190 , between ..... of ..... California, the party of the first part, and the Santa Clara County Dried Fruit Agency, the party of the second part;

Witnesseth That, whereas, the ..... are conducting the business of drying, curing, packing and shipping fruit; and

Whereas, It is desired to facilitate the sale of dried fruits when prepared for market; and

Whereas, The party of the second part is agent for said parties of the first part under the terms and conditions herein provided; and

Whereas, It is desirable and necessary at all times to have for sale fruits of the several kinds; now.

Therefore, In consideration of these premises, the party of the first part hereby appoints the party of the second part its sole selling agent, until the first day of July, 1904, upon the terms and conditions as follows, to-wit:

The party of the second part is to advertise the organization and their product throughout the various markets of the world by means of circulars, agents and such other means and to such extent as may be found practicable, and are to sell as far as possible f. o. b. for the highest price obtainable from time to time. In case f. o. b. sales cannot be made to advantage, shipments shall be made to, and sales effected through such authorized agents as may be appointed by said party of the second part.

The party of the second part shall have the absolute control as to selling of all products of the party of the first part.

In case of f. o. b. sales by the Board of Control, the said party of the first part shall have the right to transact all the business and collect the proceeds through its own office. In case where the fruit shall be shipped to Eastern agents for sale, the business shall be transacted through the offices and in the name of the said party of the second part, unless otherwise especially provided by the Board of Control.

To defray the expenses of establishing agencies, advertising and selling, there shall be charged, and the said party of the first part shall pay to said party of the second part, five per cent as commission on all f. o. b. sales, and one and one-half per cent upon the net proceeds of all consignments, and not later than July 1st of each year an account of all such receipts for commission and expenses shall be rendered to said party of the first part, and any excess of revenue over expenses shall be divided in proportion to the amount of sales. A deficit in the legitimate expenditures incurred by the said party of the second part shall be made up pro rata from each organization composing the Santa Clara County Dried Fruit Agency.

It is further provided that on the execution of this agreement the sum of $250 or such less sum as the Board of Control may decide upon shall be deposited by the party of the first part with said party of the second part to defray the expenses incurred in advance of sales, which amount shall be credited on account of commissions hereafter to be earned by said party as herein provided.

It is also agreed that the brand of the parties of the first part may be stamped on all goods shipped under this contract, and it is further agreed that the parties of the first part may be advised regarding the names of purchasers of each and every case of fruit sold under this agreement.

* * *

INVADING CALIFORNIA

Under the above head the New York

Fruitman's Guide announces what it calls the "choicest bit of news" that ever was. The invasion is from a new commission firm, whose representative is "heading straight for Riverside, and will possibly remain there permanently." Arthur Westfall is the invader whose advent is announced with such a blare of trumpets. Perhaps he may be just coming for his health, and not to take the business all away from the agencies. It is not the first time a commission merchant has nailed his banner to the mast in Southern California. Time was when the going or coming of a score of them excited no comment. They were not health-seekers in our midst ten or fifteen years ago, but they made the business of orange growing a candidate for a more healthy locality. But there arose a "new talk" from the orange growers who vowed by their mortgaged property that the time was ripe for packing these commission men off about the business of seeking other climes in which to operate, and "they sailed away, for a year and a day," or several of them. The new invasion may not be as tragic as the old one, but it will be of the same character. There may be a few orange growers who have not had the benefit of experience of observation who look with complacency upon the return of the commission system. Let them ask the first old-timer they meet or even a policeman, and he will tell them the conditions that had come over the orange business. Some people down in Orange County should ask to be "shown," also. Perhaps we may find opportunity to show them next week in these columns. Meantime keep your eye open for all kinds of plausible schemes that may be broached by those who have been dropped from the orange business for cause.

CROP REPORT.

Sacramento Valley—Weather clear and cool, but favorable to crops. Harvesting and threshing in progress. Wheat crop spotted, but will make an average crop. The cool weather retarded the ripening of deciduous fruits to some extent, but this will not be detrimental to the quality or yield, both of which are reported excellent. Heavy shipments of pears, peaches and prunes are being made from Sacramento and other places, and dried apricots are going to market in large quantities. Grapes continue in good condition and will yield heavily.

Coast and Bay Sections.—Cloudy or foggy weather prevailed along the coast and generally clear weather in the interior. The temperature was below normal in all sections. Harvesting, threshing and hay baling are in progress. The hay crop is not up to expectations, but is of good quality. Beans are doing well. Hops are said to be of superior quality, but the yield will probably be light; harvest will commence about August 25. Apricots are yielding better than expected and are of excellent quality. Apples will yield a good crop. Grapes in all sections are reported in splendid condition.

San Joaquin Valley.—Clear, cool weather prevailed during the past week. These conditions greatly retarded the ripening of fruit and melons. Grain harveting and threshing continue and the crop is fair. Cutting and drying of fruit are progressing. The peach crop is large and of excellent quality. Reports generally indicate a large grape crop, but in some sections there is complaint of mildew forming on the grapes. The outlook is good for a large orange crop.

Southern California—The weather during the week was favorable for crops, fogs in the coast districts benefiting beans and beets. Heavy crops of wheat, oats, barley and hay are being harvested in nearly all sections. Sugar beet harvest is in progress at Anaheim and Santa Maria; the crop is reported good. Late potatoes are being planted. The crop of mustard seed at Lompoc is turning out better than expected. Grapes in all sections are in good condition and will yield heavily. Oranges and lemons are progressing favorably.

Eureka Summary. — Harvesting, threshing and hay baling progressed rapidly. In the middle and southern portions of the county the yield of hay and grain is good; in the northern portion fair. Crops are generally better than expected. Some early apples are ripe.

Coast News and Notes

By R. A. Dague, 1045 Regent St., Alameda

J. N. Thompson of Bakersfield is preparing to plant a large date orchard in that vicinity.

Reports are again confirmed that the prune crop of Bosnia and Servia is largely a failure.

On the 17th 312,000 pounds of wool were sold at Great Falls (Mont.), for 17½ cents per pound.

The price of hay in the vicinity of Stockton is weakening. The price now runs from $7.50 to $9.00.

Thirty carloads of California fruit were destroyed in a recent train wreck near Lamar, Colorado.

A carload of Souvenir-do-Congress pears was last week shipped from Suisun to London, England.

Pears are a very short crop in the vicinity of Los Gatos. The fruit is covered with scale and is scabby.

The Santa Rosans are still enthusiastic over Lou Dillion, the mare that made her mile in 2.03½ at Cleveland, Ohio.

At the Santa Rosa weekly association public sale last week, sixty-two cases of eggs were sold at 25 cents per dozen.

W. H. Mills, of San Francisco, has been appointed Chief of Forrestry for the California exhibit at the St. Louis Exhibition.

It is now stated that the reports of assessors show that property in California has increased the past year $100,000,000.

Grasshoppers are doing damage in some parts of this state. Prof. Woodworth recommends the burning over of the infested territory.

O. N. Hirsch & Co. of Alameda will send to the St. Louis Exposition English walnuts which measure 5¾ to 6⅝ inches in circumference.

Pickle and vinegar works to cost $30,000 are to be erected at Haywards. The California Packing Company will operate the establishment.

Robert B. Nixon of Alameda county is producing raspberries of a very fine quality and size. Some of them measure 1½ inches in circumference.

The peach crop is reported as almost a total failure in Georgia, Alabama, Missouri, Illinois, Mississippi, Kentucky, Tennessee and New York .

Glanders is seriously afflicting the horses in parts of the state. It is especially bad in Butte, Glenn, Colusa and Tehama counties. One man lost 100 head this summer.

The hop harvest near Wheatland will commence Aug. 1. About 2500 pickers will be employed. The employes are trying to get white men and women to do the work.

All the counties south of the Tehachapi have united to make an immense exhibit at St. Louis. The counties of Central and Northern California are not yet so unanimous for an exhibit.

E. C. Horst & Co. of San Francisco estimates the hop crop of the coast as follows: Washington at 33,000 bales, Oregon 60,000, California 47,000, a total of 140,000, as against 175,000 last year

The Los Gatos Cannery has packed large quantities of cherries in barrels and gallon cans for repacking for maraschino and crushed cherries. This is the only cannery in the state making a specialty of this line.

Within the past week about one hundred carloads of Bartlett pears were shipped daily from Sacramento to Eastern markets. Peaches and plums are also going forward rapidly. The fruit is bringing good prices.

G. H. Lamberson, secretary of the Oregon State Board of Horticulture, in a late report estimates that there has been a deduction of fifty per cent on apples and pears and that cherries are not over 65 per cent of a crop. Prunes are still promising well.

Not only Fresno raisins are shipped to all parts of the world, but Fresno agricultural implements are sent abroad in large quantities. A large consignment of plows has just been forwarded to Ashton, South Africa

Prof. E. H. Twight of the Agricultural department of the State University has just returned from an inspection of the grape growing districts of Sonoma and Napa counties. He says that the prospects there were never better.

The pipe line of the Standard Oil Company from Bakersfield to Point Richmond, near Oakland, has been finished and tested. It is a success. The distance is 283 miles. It cost $6,000,000, employs 700 people and conveys 20,000 barrels of oil per day.

Mrs. E. F. Cole has on exhibition with the Oakland Board of Trade some jars of peaches which she raised from seedlings, which for size cannot be excelled in California. They are of fine flavor. She has given the fruit the name "Belle of Oakland."

While the apricot crop was light in other parts of the state, Sonoma county produced a good crop. The fruit was sold at $20 to $25 per ton. Peaches are also a good crop in this county, but Bartlett pears are poor. Grape growers are enthusiastic over their prospects.

The cheese manufacturers of this part of the state are watching a process being tried in Oregon of ripening cheese in tin cans, the curd being taken from the vat when ready for pressing and tightly sealed in the can. It is claimed that this process produces a quality and flavor that is very fine.

The hop growers of Oregon formed a co-operative organization and now W. A. Merkley, a large grower of Sacramento, announces that the hop raisers of California will soon hold a state convention and effect an organization, like unto that of Oregon, and work in harmony with the grower of that state.

It now transpires that the honey crop this year is very light—will in fact not be a third of a crop as compared to that of two years ago, from reports received by the California Honey Producers Association; from 4? producers it appears that they have only 4009 cases. The cause of the failure this year is attributed to cool, foggy weather.

E. A. Hugill, of Alameda county, is raising black figs that are probably not surpassed on this coast. A lady who has traveled extensively says she saw no figs in Italy, Smyrna or Egypt half so large nor any of such fine flavor as these. Some of the fruit is on exhibition at the rooms of the Oakland Board of Trade. Some of them are 5 inches in length and measure 4¾ inches in circumference.

The Tacoma (Wash.) News reports that the State Horticultural Commissioner has secured some fine specimens of fruit and vegetables—notably cherries, strawberries and rhubarb—for the World's Fair. Some of the stalks of rhubarb are six inches in circumference and two and a half feet long, and eighty-five mammoth cherries were counted on a single twig only 14 inches long. The cherries weighed four pounds, some of them being 3¾ inches in circumference. Nine large jars of the specimen fruits were put up right on the ground, the commissioner driving to the orchards with a wagon carrying the jars and necessary preservatives, and no time being lost in transferring specimens twigs from the trees to the jars.

A Watsonville fruit grower estimates that every blackbird on his place saves him annually five dollars by destroying fruit pests.

Reports from the state of Washington are that one of the biggest wheat crops the state ever had will be harvested this year.

The ranchers near Irwindale, Los Angeles county, are happy over the continuous flow of about 150 miners inches of pure water which they have struck.

The Watsonville "Pajaronian" asserted that during the height of the shipping season seven to nine cars of berries a day were forwarded from that locality.

Celery planting in the peatlands of Orange county is now in full swing. The acreage planted this year will be fully as large as last, and much of it will be for early delivery.

M. Theo. Kearney of Fresno, in an in an interview in New York last week asserted that the outlook for a big raisin crop at remunerative prices has never been more promising than this year.

Eighty acres of tomatoes were contracted for recently by the California Fruit Canners Association at Santa Rosa at $10 per ton. The crop comes largely from Healdsburg, Fulton and Windsor.

The National G. A. R. encampment is to be held at San Francisco August 18, 19, 20 21. The entire coast is making arrangements to give a grand welcome to the veterans who will visit the state at that time.

Insurance companies suffered a loss, which is now estimated to aggregate $150,000 by the recent disastrous conflagrations of Union Island, near Stockton. Between 7000 and 8000 acres of grain were burned.

The raisin pickers and laborers in packing houses of Fresno seem to be imbued with the union idea, and are demanding from seventeen and a half cents to thirty cents per hour for labor during the season. The growers and packers declare they will not pay it and may advertise in outside sections for more help.

GENERAL NOTES.

The trust has given another hitch to sugar, and marked it up 10 cents per hundred.

Cuba exported 569,300 tons of sugar during the first six months of 1903, exceeding the exports during the same period of 1902 by 244,000 tons.

There is a shortage of broom corn this year in Illinois, Missouri, Kansas, and Nebraska. Growers are asking $200 a ton for it.

The potato crop for the country this year, will be short, not so much because the crop is poor, but because there is less acreage. The entire acreage is 2,196,855 acres, or 49,000 acres less than last year.

The governor of Texas has offered a reward of $50,000 to any who shall discover and furnish practical means for the destruction of the cotton boll weevil.

The official reports from Washington show the corn acreage this year to be 90,000,000 acres, or four millions less than last year.

Hon. J. E. McComas of Pomona has been appointed patron of the Southern California Experiment Station at Pomona.

BETTER THAN ALL OTHERS.

Messrs. Brennan and Armstrong, the nurserymen of Pomona, send the following:

Pomona, Cal., July 6, 1903.

Publishers California Cultivator, Los Angeles, Cal.

Gentlemen: Enclosed find check to balance our account as per statement of July 1st, 1903. Kindly discontinue our advertisement in Cultivatior until further notice. Next season we expect to do some advertising and will give you a call. Please accept our thanks for all favors extended to us. Our ad. in Cultivator this season has given us more business than our advertising this season in all other papers. Yours truly,

Brennan-Armstrong Nursery Co.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so faras possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C INSECTS
(Continued)

It will be remembered that we have studied the water-breathing Crustacia class with its lively Low bug and tipsy Cray fish. The needlessly dreaded Myiapods with their indefinite legs, the eight-legged spiders or Arachnids, with its three orders of tiny mites, dreaded through really harmless scorpions and very valuable spiders, and now are interested in true insects or Haxapods, the six legged Arthropods. These have always the six legs when mature, and always three well marked divisions of tne body. We have marveloped at their wondrous transformations, wherein the repulsive maggot, and the equally hated caterpillar become the beautiful, maybe gilded and irridescent fly or the universally admired butterfly or moth. We last studied their head-organs, and noted their structure and use, and observed that as with us, the most important organ of the animal—the brain was incased by the head.

Thorax—This is the second part of the insect body. Though usually quite distinct from the head, and the larger, longer abdomen, yet it itself has long lists of three distinct rings, or segments which are always more or less marked. Next the head comes the prethorax then the middle or mesothorax, and last or hindermost we find the meta-thorax. Each of these rings or points bears below a pair of legs. Thus we have the pro-thoracic, the meso-thoracic and the meta-thoracic legs. In other words the front, the middle and the hindermost legs. Each leg ismade up of from five to ten parts or joints. Thus we see that insects best typify our great Phylum or Branch Arthrapoda, which as we remember are jointed animals with jointed legs,and as we know, the very name Arthropoda means jointed legs. The largest leg joint takes the familiar name of femur, and the longest and most slender one is known as the tibia. The termnial joints numbering from one to five, and the parts which has the same function as does our foot as they rest flat on the ground as the insect walks, are the tarsi. At the end the foot bears two claws which enable the insect to hold to wood or other similar object. As the myriod bees cluster at swarming time, and hang as a great living cone or sphere, they use these strong claws to hold on, and thus sustain themselves, and hosts of others which are pendant beneath them. Between the claws we frequently find a soft glandular organ, which secretes a sticky substance, which enables the insect to adhere or hold to such objects as glass or plaster, which would resist even the sharpest, strongest and hardest claw. The legs are variously modified. In insects that are mostly on the wing and walk little, they are weak and slender. We notice this in most moths and butterflies. Indeed a whole group of butterflies have their fore legs so weak, that only the other four are of functional importance. Insects, like beetles, that walk more and often, and fly seldom or none at all, have long strong legs, while others like the locusts, grass-hoppers and crickets have very strong hind legs, and can jump or hop prodigiously. It is said that the flea can jump 600 times his own length. If so, he must be the champion athlete. The legs are also upon occasions, useful in digging, and grasping. The digger wasps and the ants use the legs to fashion their deep holes or long under ground tunnels.

There are but four wings, in one order only two. These are appended to the back or upper part of the mesothorax in case of one pair, and to the meso and meta-thorax in the more eommon case of two pair or four wings. The wings consist of a thin membrane stretched over a more or less complex frame-work of veins. In the lower orders, as in the lace wings—dragon flies and their relatives—and the locusts there are very many of these supporting veins. In the higher orders of flies; butterflies and moths; and bees, wasps etc., there are few strong veins. In some rare cases as in thrips and chalcid flies, these veins are often reduced to one, which gives a very simple wing. The wings in strong flying insects are very heavy and strong, while in the others like the thrips and gnats they are often like slender gauze or a mere film, and are nearly as dainty, delicate and beautiful as is the rain-bow's sheen. The wings are very characteristic in the several groups and are much used in classification especially in the higher orders.

There are insects in all orders, like the ants, the female canker worms moths, the sheep tick, Fuller's rose bettle, moth aphids, and all female scale insects; the common sand cricket, also called Jerusalem cricket, (though it belongs with the katay dids and is no cricket at all); and the curious white ants; which have no wings at all. From the complex thorax we feel sure that these insects all once had wings, but in their evolution were so environed that they failed to use their wings and so nature has whittled them off. Other inseets, like the podura or spring-tail, often seen in cellars and in other damp places never had any wings. We know this from the simplicity of the thorax. The study of fossils sustains these last two positions. There is a curious case of wing pruning in the ants. After the males and young queen fly forth to mate, the workers catch the queens and gnaw off their wings, and thus they are forever restrained from going forth, and are held resistlessly to home and duty. The bee keeper who clips a wing of his queen bee, that she may not hie forth with a swarm is only following the wise example of the worker ants.

(To be continued.)

* * *

FLIES AT MILKING TIME.

C. F. B. Thermal, comments on my method of managing flies at milking time. He thinks he has a better way. He keeps in a close covered lard or other pail a mixture of one pint of kerosene oil into which he puts a teaspoonful of pennyroyal. With a cloth just before he commences to milk, he touches the cow in several places with the mixture then rubs it well over. It takes but a little and protects the cow for the day. Surely I am glad of this receipt. I hope many will try it, and many grateful cows will be the result. Mr. B. says it takes but two or three minutes to apply this, and he feels sure it is far better and more convenient than my blanket scheme. I have tried such lotions, and wish to commend them. They are very desirable, but in my case have not been so successful or convenient as has been the burlap blanket. If this is made strong, it lasts a long time, is a most excellent protection, and needs no attention except adjusting the corner as one commences to milk.
I shall try the recipe of Mr. B. and report my preference.

* * *

PRUNING ORANGES.

Mr. A. J. Drothzen on the Peyton ranch of Highland, is quite at variance with the majority of our orange growers in the matter of pruning. He goes at it in a sort of heroic fashion, cutting out much of the center of the tree. He is an orchardist of long experience and his pruning, I am told is commended by several noted authorities.

Of late, the pruning of lemons has become quite common. Many believe it pays well to cut out the center, though in regions of frosts this is less popular of late, as the upper center protects the lower branches, if the cold comes, and may be cut off in case they are frosted. In the case of oranges I think the concensus of opinion is that little pruning is desirable. Most say only cut away dead branches and over ambitious suckers, that seem desirous to far outstrip their companions. Mr. D. thinks that, as with all other fruit trees, judicious pruning is ever to be advised. Owing to neglect, the pruning of the Peyton orchard is of necessity more radical. He feels sure that results will warrant his severe cutting.

I am glad that this experiment is in progress. It does seem strange that the orange should be the one tree that needs no aid from the "pruning hook." Mr. Peyton is able to conduct this experiment whatever its results and it may be well that some experiments will reform the general practice in this matter. I am glad that our friend Mr. Sessions is working with his olive orchard in the La Habra valley. I should feel sorry to see a less able man financially conducting such an experiment.

California Horticulturally...

John Isaac, Sacramento

THE SCUTELLISTA IS SPREADING

Very encouraging reports are being received as to the work of the new parasite of the black scale—Scutellista Cyanea. Mr. Graw has been carrying on a thorough investigation of the sections in which it has been colonized and he reports it as taking hold and increasing with great rapidity and as doing good work wherever it has obtained a foothold. At Montalvo and other places in Ventura Co., it is spreading over a considerable area, at several places in Orange Co. the parasite has spread from the trees in which they were originally located over the surrounding country. In some pepper trees at Pasadena, where the Scutellista were planted last September, nearly every scale contained a parasite. There is little question that this little insect, when it is once thoroughly established, will be a most effective check on the black scale. An idea of the rapidity with which it multiplies can be formed when it is known that only three live females were received in the original shipment from South Africa, a little over a year ago, and from these three several thousand have already been distributed to different parts of the state, and these have multiplied until we may consider them as thoroughly established, and it is now only a question of time before they overtake the black scale and reduce it below the danger limit. There is now every reason to hope that the day of the black scale as a pest is over, and that from now on it will be found in constantly diminishing numbers until the balance between it and its parasite is established. But there are two things that our orchardists who are troubled with the black scale can make up their minds to, there is no magic about this work, and the black scale will not disappear in a day. It may take a long time before the descendants of the three little flies that came from South Africa will increase in sufficient numbers to overcome the enormous hordes of black scale that cover the vegetation of the whole country, it will not be done in a day, as some of us seem to expect, and further, the Scutellista will never eradicate the scale, but in time will overtake it, and reduce it so that it will no longer be a serious pest.

* * *

DAMAGE FROM WINDS AND PEAR SCAB.

The heavy winds which visited the Sacramento valley the beginning of July and which it was feared had done very great damage to fruit in the section in which they prevailed, appear to have done less damage than was at first feared. Very much fruit was blown from the trees, but not enough to materially influence the total output, which in all classes of fruit is proving to be very fair this season, considerably exceeding the output of last year. In the hop yards it was feared that irreparable damage had been occasioned, but the vines have all been lifted up, and while there has been some little loss and some cost for putting down poles in shape again, the hop growers have not suffered materially. In the pear orchards along the river pear scab has been very prevalent and has caused the destruction of a very large percentage of the Bartlett pear crop in the principal pear section of the state. It will be well for the peargrowers in this section to take time by the forelock the coming season and spray for this disease during the dormancy of their trees next winter. The disease is one of the group of fungus diseases, the spores of which find lodgment on the twigs of the trees during the winter and awaken into activity as soon as the sap begins to flow in the spring, spreading to the new growth and especially to the young fruit. Its ravages may be checked by a thorough spraying with the Bordeaux mixture before the buds swell in the spring and the repetition of the operation later on. Pruning should be finished before the spraying is done and all prunings carefully burned.

* * *

DYNAMITE FOR TREE PLANTING

Horace Greeley, who prided himself on what he knew about farming once stated that the man who should invent a plow capable of turning over the soil to a depth of two feet would be one of the greatest benefactors of his race. Horace never thought of dynamite. But in this powerful explosive we have the means of doing much better than Greeley ever thought of. For ordinary crops, of course, no one would ever think of plowing with dynamite, but in preparing land for tree planting, it can be used to great advantage. All trees love a deep, friable soil, one that their roots can easily penetrate, and one that will retain the necessary moisture for their growth. If a newly planted tree finds a loose soil, easily penetrated by its roots, prepared for it, it will respond heartily and the first two years' growth will amply compensate for the labor involved. No argument is necessary to prove this point, as every orchardist is well aware of the stunting effect of shallow hardpan on trees planted on it. With half a stick of dynamite the ground can be loosened for a depth of 8 to 10 feet and for a radius of several feet. If properly handled there is no danger to be apprehended in the use of dynamite. For using it in orchard planting a crowbar, or in soft ground a two inch augur, which has been lengthened out with a seven-foot shaft, which any blacksmith can prepare, is used. With this tool a hole in the ground six feet deep should be made. Take a stick of dynamite and cut it in two with a piece of wood sharpened to a knife-like edge. Take a six-foot piece of fuse and insert it in a fulminating cap, then make a hole in the end of the stick of dynamite with a sharpened stick and insert the cap, tieing it in firmly so that it will not slip. Now drop it in the hole prepared for it, fill the hole with sand or loose soil and touch off the fuse. In rocky, or very harsh soil it may be necessary to use a whole stick, or even two, but in ordinary soil half a stick will do the work. The charge will stir up the ground for some distance below the bottom of the hole and shake it up on all sides for a distance of 15 to 20 feet. There is little danger from the explosion as the discharge will only heave up the surface a little and no earth is thrown into the air. Silo prepared in this way is more retentive of moisture and gives ample root room for the growing tree. In hardpan soil, preparing the land with dynamite will be found a most profitable investment for the tree planter.

NATIONAL BEEKEEPERS' MEETING.

The National Association of Beekeepers honor California this year by holding their annual meeting in the city of Los Angeles. The session will first convene on Auguust 18th and continue three days. It is said that it will be the largest and most representative meeting of beekeepers ever held in the United States, or possibly in the world. Many prominent eastern beekeepers will be here, and the local men are all planning to give them a pleasing reception.

Estimates of the coming wheat crop place the total for the country at 740,000,000 bushels.

The Yeas and Nays of Citrus Culture

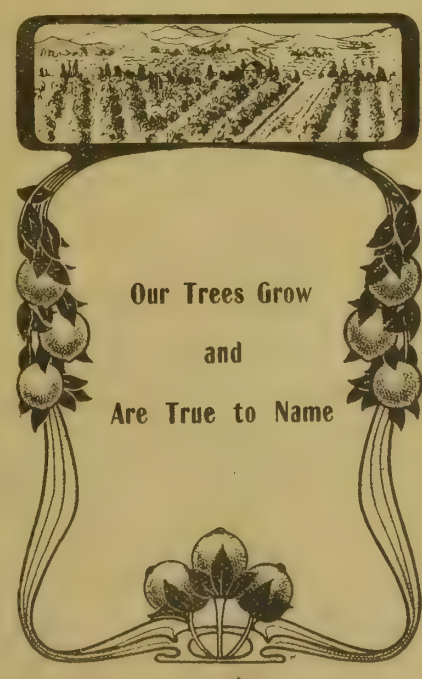
"Citrus Trees for the Million—a veritable sea of nursery trees in rows and going to intending planters everywhere."

1. A Plot of Citrus Trees on our Home Grounds. 2. A Daily Scene during the Shipping Season at San Dimas.

If you plant inferior trees, it makes little or no difference how fine your location is for citrus fruits; nor is it of much consequence if your soil is good and your water supply for irrigation ample, because badly-grown, weak and untrue-to-name nursery trees can never grow a profitabie orchard, even under the most favorable conditions. An experience of upwards of twenty years in the growing of citrus trees exclusively has demonstrated this fact so forcibly that we never buy trees from other growers, but sell only what we actually grow and warrant to be the best that skill, superior soil and climate can produce. That this policy—though at times losing an order because we happen to be shy on certain varieties—is a winner is forcibly attested by the fact that that the San Dimas Citrus Nurseries are now the largest growers of orange and lemon trees in the world. "Value for value, and the best is none too good for even the small planter," are two principles from which we never deviate.

We now supply many of the best planters in all sections of the world where citrus fruits are grown with their nursery trees, and stand ready to serve many more in the same way. Orders going to Italy, Australia, South Africa, Porto Rico, Cuba, Mexico, the Philippines and the home trade all give evidence of satisfaction with our trees and methods of business. In view of this fact, may we not supply your wants also? Our booklet on the "Yeas and Nays of Citrus Culture" tells all about growing an orchard and also how and why we do and get business. A copy is yours for the asking; write for it today.

Our Business is a Growing One and Yours Will Be if You Plant Trees Grown by Us.



The San Dimas Citrus Nurseries

R. M. Teague — San Dimas, Cal., U. S. A.

By J. W. Mills, Ontario, Cal.

KHAMA MELON AGAIN.

Editor Cultivator: Will you please tell what the Khama melon is like, and if it is as good for stock feed as the Kansas melon? Subscriber, Santa Paula.

The Khama melon makes a good stock feed and is much more productive than the Kansas melon on poor sandy soil, but the latter produces more on good soil. The Khama melon will not keep long. It is small, averaging about 4 inches in diameter, but some vines have produced over 300 melons. We do not recommend it for planting except on dry sandy soil that will not produce other crops to advantage.

SISAL.

A subscriber wants us to tell through the Cultivator, something about the "new hemp plant" called Sisal, and if it can be profitably grown in Southern California.

Sisal belongs to the same family as our "century plant," whose botanical name is Agave Americana. Sisal is Agive rigida, of which there are two sub-varieties that are cultivated for the fiber in tneir leaves. It is not a newly cultivated plant by any means, it having been grown commercially for a couple of hundred years in certain parts of the tropics. It derives its name from the port of Sisal in northwestern Yucatan, from where is has been shipped in great quantities for several centuries.

The plants present about the same appearance as a century plant, except that the leaves are not so thick and fleshy, but longer in proportion to their thickness, on well grown plants, being from four to six feet long. They are smooth on the edges with sharp spines on the ends of the leaves which are a dark velvety green. A leaf six feet long will be but about five inches wide and half as thick at the base.

Its native habit being in the tropics, we naturally would think it would be very sensitive to frost, however, our experience at the Pomona station has been that if it can be pulled through the first two or three winters, it will not be materially injured by 24 degrees. It will not grow at all during cold weather and by the time it gets well started, cool weather is again with us, and as a consequence, our plants that are now six years old are not over 18 inches high. Had they been grown in their proper climate, they would have been at least six or seven feet high. Our plants are situated on the bank of a small irrigation ditch that is used at least once a week.

Florida began to grow sisal in 1836, and at this time the plant is widely grown over all of the state south of the frost line where the land is suitable for its growth. Nearly all of the important islands in the West Indies imported plants of sisal from Florida, consignments having been sent in recent years, to South Africa and tropical parts of Australia . In 1893, the Hawaiian government imported from Florida, 20,000 plants for experimental purposes. As a result, several companies with ample capital have been formed to pursue the industry, one plantation of 300,000 plants having been established last year.

There may be certain sections in Southern California which will grow sisal at a profit, but as yet we do not know anything definite about it. The most profitable plantations are situated in limestone soils in the tropics. It does not require much rain, but wants it often. In situations where light showers or even heavy fogs prevail, sisal thrives well. The root system is confined to within 18 inches of the surface, hence the need of frequent supplies of moisture. It does not take kindly to artificial irrigation except by sprinkling. It is said that it is imperative that the plants when grown in nursery form for future plantations, be sprinkled and not flooded. The shape and position of the leaves enable them to collect all water that falls over them so that it will run down to the ground at the base of the plant. The plant does not thrive with cultivation, due no doubt to its shallow root system. Irrigaion without cultivation will not be profitable as a general thing. The nature of the plant demands a moist atmosphere, as it gathers moisture for the roots from rain and dew as described, and also absorbs moisture directly through the leaves. The roots are very sensitive to moisture and soil conditions. Land that is lable to overflow is unfit for it, the roots being rotted by such treatment when the water is allowed to stand for some time. It is stated that the soils around Merida, the leading sisal producing district in Yucatan, are composed of arid, cavernous limestone, and that in the whole region there is not a single running stream. Mr. Chas. R. Dodge, writing in the Scientific American Supplement, says that the same region is barren of soil, the sisal plants often being propped in place by stones or stuck in crevices in the coral rock. It is from this section that some of the best grade of sisal fiber is exported. It shows that the climate has much to do with the proper development of the plant as does the soil. Proximately to the sea, high temperature with low rainfall are the climatic conditions required. These can no doubt be found in some of our coast regions where the foot-hills crowd close to the sea.

The young plants are started in the nursery from either bulbs or suckers. The bulbs are obtained from mature plants. They send up a flower stalk just as our century plants do and have exactly the same general appearance. No seed pods are formed, but in their place small bulbets grow. One stalk will produce from 2000 to 3000 bulbets. These fall to the ground and can be picked up and shipped or planted in the nursery. Rootstalks are sent out from the old plants and young plants come up from them also. These should be severed from the old plants at the time the latter are sending up a flower stalk, or they too will bloom.

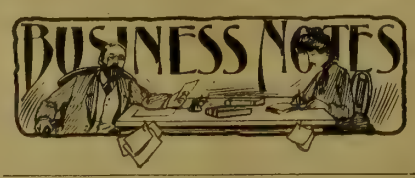
On poor soil, not less than 600 plants per acre are grown and on rich soil, not more than 900 per acre. Rocky rough soil is often used. Reports from Yucatan show that it is not advisable to make many plantings on the same ground. In 1832 they used to get a crop in two years after planting and the plants produced over 20 leaves per annum. In ten years the plants matured. Last year, the records show that no crop is realized until five years after planting, but 12 to 15 leaves are matured in a season, but the life of the plant lasts from 15 to 20 years. Each plant will produce about 250 leaves during its life time, making a yield of from 5000 to 6000 pounds of fiber per acre during ten years. Sisal fiber sells in the United States at 10 cents per pound. That would give a yield of from 50 to 60 dollars per acre annually. After the first year there is very little expense. The annual importation into the United States amounts to about $12,000,000. Sisal fiber is used almost entirely for making binding twine.

* * *

NEW BERRY PLANTS.

Editor Cultivator: I would like to know where I can get the Big Sheng raspberry and the Rogers dewberry? Could you inform me through your paper? Chas Inman, Campbell.

We do not know where either of these varieties can be secured. We advise you to put your order in the hands of some of the seed and plant men in San Jose, San Francisco or Los Angeles.



BUSINESS NOTES.

The present indications of a large crop of oranges for next season is already causing the citrus growers to cast about for some means of supporting the over-loaded trees. The past experience of ruin of valuable trees from large crops has been such that all careful growers wish no more of it. There has been devised a number of methods of supporting and saving these trees, none of which have been more effective than the old and reliable Woodward Tree Prop, which has been manufactured for the past thirteen years in Riverside. These props are a favorite for the reason that they are readily adjustable to a limb of any height, they are so made as to hold any weight which may be put on them, and may be stored in a very small space. They are so simple that no repairing is ever necessary and so constructed that several may be used on one support. The Woodward Company has recently moved to their fine new building in Riverside, and has installed a line of labor saving machines which enable the manufacture of this prop at a lower price than ever before. They give the benefit of this economy to the fruit growers and have reduced the price to $17 per thousand. Their present machinery enables them to produce 20,000 props per day, which, with the amount that they will have on hand at the beginning of the season will be such that they will be able to fill any order that may come in. With the present prospect of a big crop, it is liable to be a record breaking year for this company, although two years ago they put out over $14,000 worth in one season.

* * *

The California Iron Works of Riverside have just completed a shipment of a packing house equipment for an orange packing house in Porto Rico. The Porto Ricans seem to appreciate the portion of the country to come to for first class equipments. This company has equipped some of the most up-to-date packing houses in California, and with their new foundry and machine works, are prepared to install nearly any kind of packing house equipment.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, LOSANGELES, CAL.

AUGUST VEGETABLE CALENDAR.

Next month is one of harvesting rather than sowing among the vegetable growers; though as stated by Prof. Mills about two weeks ago, this is a splendid time to plant potatoes for a late crop.

It is also in order to plant during August: Beets, cabbage (early sorts), carrot, cauliflower, lettuce, onion, parsnip, peas and turnip.

* * *

NATIVE SUNFLOWERS.

Almost every one is familiar with the common annual wild sunflower though few are aware that the skillful horticulturist has evolved from it the large sunflower of our gardens. Its scientific name, Helianthus annuus, literally translated means "Annual Sunflower." This must not be taken for proof that it is alone in this respect, for we have at least one other annual species, (H. Bolanderi) which is quite a pest in the grain fields in the Sacramento valley.

We have several other sunflowers native to California, all are perennial

Helianthus Oliveri, One-Third Natural Size.

rooted and of greater horticultural interest than the annuals. Some grow on the dryest hillsides, while others, like H. Californicus, inhabit the banks of the streams. The one illustrated on this page is of unusual botanical interest for the reason that is is nearly if not quite extinct. Its only habitat was the Cienega swamp between University station and the sea, where it has been exterminated by drainage, and a swamp in East Los Angeles, lately filled by the S. P. R. R. Co. This species, known to botanists, as H. Oliveri, is very different to tell from H. Parishii; the latter occurs only at San Bernardino and Mr. Parish says they are too close to separate. Both grow from six to fifteen feet tall and have large clusters of really showy heads and are fine plants for a damp spot where a tall background is desirable. The roots are perennial, quite fleshy and tuberous and may be found dormant from autumn to early spring. Every public garden (and many private ones) in the state should make an effort to secure roots of this Los Angeles species, if it is not already extinct, but unfortunately such places are seldom in charge of plant lovers, but filled rather by those who have a pull, so we can but say: "Farewell, Helianthus Oliveri!"

* * *

RESTING ROSE BUSHES.

Roses that have been established for one or more years should not be given any water until autumn. Do not be alarmed, even though they drop their leaves. It is perfectly natural for all roses to become dormant at some season in the year and the only wonder is that our bushes do so well with such a great amount of overwork. Even though all the wood smaller than a lead pencil shrivels, the plants are not harmed, though when they reach such a stage they should be pruned very heavily, watered and two or three weeks later, fertilized. Such treatment will result in an abundant winter's crop of superior roses.

* * *

"FLORA AND SYLVA."

The above is the title of a new floral magazine, now in its fourth month, published in London, England Each issue contains forty pages on hand-made paper, two-colored plates and a number of excellent wood-cuts. It is edited by William Robinson, author of "The English Flower Garden," a noted work by one of the greatest gardeners the world has ever seen. Though this magazine is a very high-grade publication, its price of eight dollars a year really seems on a still higher plane (financially).

* * *

FERN SCALE.

"P. Culiar, of Ventura, one of the most frequent and appreciative correspondents of this department, sends a frond of a potted fern covered with scale and wishes to know what best to do.

The scale had been almost crushed to dust in the mail but a close examination seems to fix it as the hemispherical scale and we are sorry to state that it is very troublesome to get rid of unless one can fumigate their plants. We would advise cutting off all the fronds, rinsing off the remaining stump with strong soap suds, but being careful not to get too much soap in the soil. If the stump is looked over first and all scale removed and the plant is carefully examined once a week for the first month after starting anew, no trouble from the scale will ensue, unless you have other infested plants from which the pest may come.

FREE We are going to give away, to the readers of the "Cultivator," a limited number of THE SULPHESIA CUPS, so that one or more is placed in every community, absolutely free of cost. These wonderful health-giving cups make a delightful Mineral Water in two minutes, and keep the system in perfect health. Write at once for Cup and particulars. Agents wanted. PETALUMA, CAL.

Mid-Summer Farmers' Institute

MANY MEN OF MANY MINDS DISCUSS SCIENTIFIC AND PRACTICAL QUESTIONS. A STRONG PROGRAM WITH BUT FEW TO HEAR.

After eating a good old fashioned Thanksgiving dinner a little girl once said that she did wish she could eat more for her mouth was yet awful hungry, but her stomach wasn't a bit.

That's the feeling at Long Beach this week. A perfect surplus of good things. But it is all being taken in and great good will come of it. But the farmer who finds difficulty in choosing between two fertilizers each of which is "best;" or of deciding between spraying or fumigating, or even of giving a sure cure for puffy oranges, has a task which is far easier than that of a newspaper which would pack six solid days of institute into a few pages.

It can't be done. However it may be possible to give a few tempting morsels which may make some who didn't go wish they had.

Other features and some of the papers will appear in later issues of the Cultivator.

It was the heaviest program ever attempted in Southern California. Its reception is such that it may be repeated another year.

The attendance on Monday morning was not as great as it should have been. The preliminary talks were the foundation for the work of the following days. It certainly gave a strong grasp of the following programme. The first feature was instrumental music, followed by invocation by Rev. C. P. Dorland, pastor of the Congregation church. Mr. Dorland also gave a most hearty welcome to the church and wished that all attending the Institute would make themselves at home, not only on the main auditorium, but in all the rooms of the church.

J. A. Miller of Long Beach, followed with an address of welcome, and he made it not only most hearty as to this Institute, but hoped the impression formed by those attending would be unanimous in a desire to return for future institutes, which he hoped would be a regular feature of Long Beach.

Prof. Cook responded, expressing appreciation for the nearty welcome and referred to Long Beach as a place where it was not only a summer resort, in which tourist crops were cultivated, but that it was, contrary to conditions usually near the beaches, an agricultural community. This is attested by the large number of products, from the immediate neighborhood, which are sold at stands in this thriving little city.

TEACH THE CHILDREN.

Mr. Allen of Bonita, was not present so his article on Distillate Spray or Fumigation was put over until a later session. Prof. Cook immediately took up his talk on insects which he brought out in a practical and intensely interesting manner. The first point which he made of the greatest importance was that all should study the life history of the insects which are about us on all sides, and that we should not only do so because of the practical side of such study, but because of the intensely interesting recreation which it gives to us. He gave instances where children were greatly benefited and given a most admirable habit of observation by their study of insects. He considered the taking of the study of entomology out of the public schools as a serious mistake, though he admitted that many of the teachers, who attempted to teach it, were not in the least qualified to do so.

He then gave directions as to how children might get a good general idea of insect life. The necessary articles to provide for this study are a net for catching the insects, cyanide bottle, box or tray in which to keep insects, and slender pins, which are made for this particular purpose. Of course, all understand that the net consists of a hoop at the end of a handle and from it is suspended the net, like a bag. The cyanide bottle may be a common pint or quart fruit jar on the bottom of which is placed a small piece of cyanide, and over this is poured a solution of plaster of Paris, which when it hardens, holds the lump in place. The fumes of this will cause the painless and almost instantaneous death of many insects put in the jar. The professor asserted that these fumes will effectively kill all life even the eggs.

NEEDED APPLIANCES.

One point which he especially dwelt upon, was, that if the children take up the subject of insects, it should be impressed upon them to observe absolute neatness in the mounting of their specimens. He especially brought out the fact that a good close box should be provided so as to protect the insects from any other insects which might enter. He said a common cigar box would not answer for this purpose.

The great branch of the animal kingdom in which insect life is placed, is called the anthropoda, in which comes the crustaceans, myriapods , spiders and the true insect. The crustaceans or water breathers were discussed only a very few minutes. The myriapods, which are very useful to the human race, include tne thousand-legged worms, which never have 1000 legs, though they may have from 200 to 300 legs on its 60 to 70 joints. In fact this morning's lecture was more in the nature of a preparation and a general view of the great divisions of the animal kingdom, with an idea as to the more specific lecture on insects which is to follow.

The professor was especially urgent that all present should overcome the natural, or as he termed it the unnatural repugnance which most have for spiders, caterpillars, also that children should be taught to admire the beautiful in this form of life.

PROF. McCLATCHIE.

Prof. A. J. McClatchie of the Arizona Experimental Station at Phoenix, Ariz., who is one of the greatest authorities on eucalyptus there is in this country, and who is a thorough student of nature, added much to the interesting programme. Prof. McClatchie is not an orator and does not convey the impression that he is dispensing a large amount of learning, at the same time his talk, given in a very entertaining manner, held the audience. He began by taking a general view of biology which includes all organic matter. Prof. McClatchie said, in part:

"There are more than dollars and cents in this world, and a simple knowledge of plants is certainly worth something to us. In the first place, as you know, the material of this world is made up of inorganic and organic matter. Organic matter has organs or is some product of something that has organs, such as sugar, starch, etc. Inorganic matter is something that has no organs, such as gold, silver, the elements, etc. Chemistry has to do with both. In speaking of plants we have to do only with organic matter.

We know that the first condition of the world was a heated molten condition and that no organic matter could have existed. So we find that it was all inorganic life. As to what the source of organic life was, we do not know, but we do know that the organic was derived from inorganic, and it depends largely upon inorganic matter. Plants have the power of feeding on inorganic matter; animals only on the organic. Biology means a discussion of life or of living things. It is a general term and is divided into two departments, animal study and plant study. Plant study may be divided into several departments; their structure, organs, and from a standpoint of their usefulness and economy. Plants that are alike in structure are called species. The lemon is one, the orange is another. An assembly of species is called a genus. Now then species are grouped into genera, genera into families, families into orders, orders into classes, and classes into branches. Before I go further though, I want to impress upon you the fact that children can learn these scientific terms as easily as the older people. They cannot only learn them but understand them as well.

FIRST LIFE.

"The first plants that appeared on the earth were the very simplest in structure. For hundreds of years there was nothing but the simplest plants one of them being the green slime, and its relatives. This green slime is composed of very small spherical bodies, made up of single cells. This growth is not in any way harmful, but of course, if it is allowed to decay, it will furnish conditions that are harmful. These plants need sun light. If they have no sun light they will die.

"Another group of great importance is the bacteria, which are sometimes called germs, microbes, etc. But bacteria is the proper term for these small plants. They are plants though at one time they were thought to be animal life. They are every where, but so small that they cannot be seen with the naked eye. Although most of them are a benefit to the human race, a single bacterium can accomplish nothing, while myriads can do anything. They are very, very small, and like the green slime have only one cell. Some are round, others oblong and others spiral in shape. They grow as any other plant, and need food, moisture, and proper temperature. If you raise the temperature to a high degree they cannot grow, or may be killed. If you make the temperature low their growth stops. That is why we dry fruits, boil milk, preserve meats and other things in a refrigerator, etc. They thrive best between 50 and 100 degrees. If you heat milk three times at intervals to 160 degrees for 15 minutes, every disease germ would be entirely destroyed. Bacteria creates various substances, mostly acids. They do more good than harm, although many people think they are very harmful.

BACTERIA.

"There are 500 species of bacteria, and only about twelve of these are harmful, and fewer are very harmful, all others are useful, in fact we could not live without them. They are especially useful in changing the organic matter back to the inorganic matter, for if we did not have the bacteria our supply of inorganic matter would soon be exhausted, but as it is now, it is inexhautible. For instance, inorganic matter is taken up by the grass, a rabbit eats the grass, a fox eats the rabbit, the fox dies, and by the aid of bacteria, the substance in the fox's body is changed back to inorganic matter. So do not make the mistake of thinking that the bacteria are only harmful, because we would not have been here today, were it not for the bacteria.

* * *

MONDAY AFTERNOON.

The question box opened the afternoon session and brought out most interesting discussion.

What kind of fertilizers for tomatoes planted in a sandy soil? Referred to Professor Loughridge and his answer was, of necessity, indefinite, because, as he said, he must know the soil and other conditions before any definite answer could be given, but it was generally conceded that stable manure might be applied with advantage at any time. The same question as to grapes brought out the answer that as a rule grapes needed an abundance of potash.

* * *

The most extended discussion was brought out by the question as to whether thrips feed on black scale. Prof. Cook said that thrips only feed on vegetable life. In this Mr. Payne, of Monrovia, and Prof. Craw differed, as they had seen thrips in the act of feeding on the young of a scale. The variety which is predacious is the black species and it is hoped that they may prove a material aid in controlling this pest.

A discussion as to whether the red spider, which infests the deciduous trees is the Bryobia or not, brought out diverse opinions, Mr. Craw, Mr. Payne and Mr. Pease holding that it was the same.

What time of the year could stable manure be applied to the orchards? Referred to Dr. Wall for answer. He said that the best time was whenever you could get it. He applied it at all times, in the summer as a mulch, which is again applied in the winter and then plowed in. Dr. Woodbridge felt that if it could be cheaply enough purchased, it should be applied at all times, but his idea was that good wheat straw which could be had usually at one dollar a load was really worth as much if not more than the usual load of Los Angeles stable manure. The ordinary stable manure purchased having as high as 60 per cent water. The handling of this water is an expense, and of no worth to the fertilizer. Mr. Harwood of Ontario said that he had purchased in Los Angeles stable manure which at first weighed twenty-two tons. He threw it in a pile, and when taken to the orchard it weighed only nine tons, and he asked if it was as good at nine tons, as a fertilizer, as it was before. Mr. Woodbridge replied quite decidedly that it was. The Doctor further said that the fertilizing element of wheat straw was approximately $7 per ton, or barley straw $5 or $6 per ton. Another question was as to whether there was any loss of fertility from throwing fresh manure from the stable to the corral, and there dried out, and some discussion arose with the general impression that there was no deterioration.

NO ABSORPTION BY LEAVES.

The first talk by Prof. Loughridge of the University of California, Berkeley, gave a general view of the field of chemistry as applied to agriculture, and practically considered the chemistry and requirements of plants. He said of the seventy or seventy-five elements existing, that there were about seventeen found in the analysis of plant life. Of these seventeen, there are about four that are of any great importance; these are oxygen, hydrogen, nitrogen, and carbon.

There are two principal groups or combinations of these elements forming the carbo-hydrates and albumenoids. The three necessary conditions of plant life are sunlight, air and moisture. As to the necessity of abundance of moisture, he stated that one ton of wheat required the total of 350 tons of water to mature it; one ton of alfalfa, 400 tons of water; one ton oats, 500 tons water.

No moisture is ever absorbed through the leaves, which is contrary to the usual belief. The spraying and filling the air of any room with moisture prevents the rapid evaporations which do take place from leaves of any plant therein. This revives the plant and gives the impresion that this moisture has been absorbed by it.

THE ELEMENTS.

In addition to the four plant elements named above, the others are, potash, soda, lime, magnesia, manganese, iron, alluminum, silica, chlorine, phosphorous iodine, sulphur and bromine. These elements are some of them necessary to the plant growth, while many of them, if they are of any use, it has not been determined by chemists; for instance, at one time silica was supposed to be necessary to give strength to the straw of the wheat and other grains. It is now known to be unnecessary. The fact is that it is in the soil and the greediness of the roots which take up all that is soluble in the soil and the plant absorbs this, that it appears in the analysis. Of these seventeen elements all are taken from the soil, except the one, carbon.

WATER NECESSARY.

Referring to the needs of the plant for water, again the Professor mentioned the experiment in which 4½ inches of water produced 15 bu. per acre, doubling the amount of water produced 30 bu., doubling the amount again produced 60 bu. per acre; showing that with the elements already in the soil, to give plants food, the necessary requirement is abundance of water.

ALEXANDER CRAW.

Alex. Craw of San Francisco, who is at present clerk to the Commissioner of Horticulture, is now in Southern California investigating the success of the predacious insect, Scutellista, which was imported from South Africa, was able to present and gave a most interesting talk as to the benefits of the work of the Horticul-

tural Inspectors, and by the State Board of Horticulture. Mr. Craw said in part:

HORTICULTURAL QUARANTINE.

In complying with your request to address this session of the Farmers' Institute upon "Quarantine Against Insects," it was because I thought it possible to be present, as it occurs at a time when the importation of trees and plants is lightest.

Another important consideration that made it possible was that I had previously received instructions from State Commissioner of Horticulture, Ellwood Cooper, to visit all the Southern counties and investigate the present condition of insect pests in the orchards, as to their control, and especially to learn the result of the efforts made by Mr. Cooper to establish the various beneficial insects introduced into California for the suppression of the noxious introduced species.

ONLY TWO.

Within the past fifteen years only two serious insects have been established in orchards, and both were brought in on trees by rail. One, the "black peach aphis" (Aphis persica niger) from the Eastern states, and the "Purple scale" (Mytilisaspis citricola) from Florida, on citrus trees.

We have had trouble by officials in other states holding up shipments of apricots said to be infested with San Jose scale, when it was shot-hole fungus. The scale is not known to attack the apricot tree, or fruit. A few years ago this was a very destructive scale, but it met its Nemesis in the form of a tiny four-winged fly (Aphelinus fuscipennis). You can imagine its size when I inform you that each scale—not larger than the head of a small pin—contains sufficient food to develope a full-fledged fly, from the egg, through its magot form, to the perfect insect. In the San Jose district, where the scale was first introduced, it can hardly be found now, owing to the work of this parasite, aided by predacious insects. In fact, it is a rare scale now in California. Until Mr. C. L. Marlatt's recent visit to Japan and China its habitat was a mystery. In the latter country he found this scale. He also found a lady bird beetle (Chilocorus similis) that appeared to be the natural check to the scale in that country, and succeeded in introducing a colony into Washington, D. C.

WHITE FLY.

I desire to again call the attention of horticultural commissioners and inspectors, and also to intending planters of citrus trees, to the very great danger of introducing the "white fly" (Aleyrodes citri) from Florida. I have reliable information from that state that no portion of it is free from the filthy pest. The "black scale" is a clean insect and spreads slowly as compared with the "white fly." The latter exudes great quantities of honey dew and the infested trees soon become encrusted with black smut. The female "white fly" has two pair of wings and can spread more rapidly than the wingless female scales.

MANDAMUS THE SUPERVISORS.

Fruit growers in counties where their Supervisors have refused to appoint horticultural commissioners should have the court mandamus them to make such appointments in order to protect the fruit interests of their county and state at large from new pests and diseases. If one county in a fruit district is permitted to evade the expense of employing three or more officers to guard aginst the introduction of pests, it practically renders invalid the efforts of others adjoining and more prosperous and progressive communities, and should not be tolerated. See our law to protect and promote the horticultural interest of the state, approved March 31st, 1897. Section I of the Act makes it obligatory on the part of the supervisors to appoint a commission of horticulture, consisting of three members, when petitioned by twenty-five or more persons each of whom is a resident freeholder and possesor of an orchard. Orchard property is taxable and orchardists should see to it that a commensurate proportion of that tax is used for the protection of that property.

In drawing up a petition to be presented to the board of supervisors for the appointment of a county board of horticulture, it should be worded and the appointments made as required in the statute.

The paper of Mrs. Sherman of Fresno appears almost in full upon the first page of this issue. In the discussion of this paper, a question was asked her as to her favorite breed of the dairy cow, but she answered that there was not so much depending on the cow as there was upon the man or woman conducting the dairy. Any good breed given good care and carefully brought up to a true dairy type will bring good results. Mrs. Sherman's favorite is a Holstein which she has made such a complete success. Formerly she kept the Jersey, and still has a kind word to say for the Jersey, but the reasons for the change is that the conditions of Fresno are such that the Holstein brings the better returns for her than any other. Her registered herd gives a butter fat test of 4.4 per cent butter fat, the individual cows varying from 2.3 per cent to 5.1 per cent.

* * *

MONDAY EVENING.

The question box brought out only a few questions, but no little interest was manifested. As to how deep furrows should be in orchards for irrigation, brought out diversity of opinions, due, doubtless, to unequal soil conditions. Mr. Kennard uses three furrows six to eight inches deep, water runs eight or ten hours every five or six weeks. Mr. Prescott, six or seven furrows, four to five inches deep, runs six to twelve hours. Dr. Wall wishes none of the deep furrows and uses many furrows that are shallow. Mr. Blanchard, four furrows between rows in clay loam soil, four or five inches deep, runs forty-eight to seventy-two hours, every six weeks or two months. Mr. Harwood, eight to twelve hours, and in other soil which is of a clayey nature, thirty-six hours gave no better result than eight to twelve. Dr. Needham of Glendora gave the same opinion from his own experiments. Mr. Day spoke of securing excellent results by the zig-zag system.

HORTICULTURAL COMMISSIONS.

Then the Horticultural Commissioners were given almost the entire evening session. J. W. Jeffrey of Los Angeles county, S. A. Pease, San Bernardino county, E. L. Koethen of Riverside, each presented a paper from which we quote below:

HORTICULTURAL OFFICERS AND THEIR TERM OF OFFICE.

Mr. Koethen of Riverside, sent his paper which was read by Mr. Stone. In part he said: "The duties of the Horticultural Commissioners are recognized to be of such vital importance to the horticultural community and the necessity of maintaining a strict quarantine against insect enemies are so evident that it is unnecesary to put stress on the necessity of maintaining this commission. But the carelessness with which we allow the appointment of untrained and the removal of efficient ones for political reasons indicates a lack of appreciation of greatest efficiency.

The inspector must be familiar with all forms of life, especially all insect pests estabished in the state. He must know the remedies needed for application. He must know the desirable insect to be preserved.

That many appointments of a purely political nature have been made in the past and many removals for political reasons have occurred throughout the state, very much to the detriment of the horticultural interests are facts that all will acknowledge, and it is time that we, the fruit growers, demand such legislation as will afford us a remedy. The most needed reformation in making of appointments of horticutural officers is for the applicant to take an examination to show his qualifications for office. The best officer in charge of such examinations is the quarantine officer. This would remove every possible political scheme from the appointments of these important officers. The offices should be filled for a definite term, and not at the will of politicians.

As to the reduction of the number of commissioners, as suggested by Prof. Cook, that may do in some counties, but I hope no law wil be presente that will make the reduction to one compulsory. In counties like ours, it is essential that a commissioner be in charge in each district and the present law works well here.

Space compels us to pass Mr. Jeffreys' and Mr. Pease's for the present.

ERNEST BRAUNTON.

Ernest Braunton of Los Angeles, floricultural contributor to the "Cultivator," spoke in a most entertaining way on floriculture, giving this evening some foundation elements of small yard ornamentation. He said that he could only give an idea along the line of nature gardening, formal or architectural gardening had never been his study. He believed in following nature in the ornamentation about our houses as closely as possible. The art of landscape gardening is but little improved by experience or practice; it is more of an inspiration and capacity to get close to nature. He referred to busy people whose love for plants has made them noted along the line of landscape gardening.

The best developments have been reached only during the present century. Prior to that extremes in formal and grotesque shapes in gardening prevailed. The three principal points or foundations of landscape gardening being to preserve open lawn centers, plant in masses and avoid straight lines. He exhibited a chart which was published in an article in this paper some months ago, and showed the beauty and convenience which would come from keeping the lawn centers open to allow of view from and into the house, and showed how massing the plants along the sides or in clumps where greatest beauty could be obtained, added much to the effect. He also appealed for the beauty to be used in back yards. A few trees here and there and a rustic seat, makes a vastly better looking back yard than ash and swill barrels.

* * *

TUESDAY MORNING.

Prof. Cook's talk upon the arachnid group of animal life devoted special attention to the mites. He spoke at some length regarding the red spider, and said that from his own experiments, he knew that distillate spray was the best of all spraying for this particular pest. He said he knew from observations that this wash would absolutely destroy some of the eggs which might be deposited on the leaves if it came in contact with it. The most interest, however, seemed to be created in his talk on the Texas ticks which are the cause of the Texas fever. This particular disease is caused by a sporozoan, a mite of animal life instead of plant life as is the case of the anthrax, which Prof. McClatchie spoke of. The mite is introduced into the blood of a healthy animal by the Texas tick, which may have the germs within itself, or it may be introduced with a pin which has been inoculated by sticking in a diseased animal, and then bringing in contact with the blood of a healthy animal. The mosquito is known to introduce other diseases into the human body. Regarding the Texas fever, manner of handling, vacination to prevent it, etc., Prof. Cook referred to a bulletin published by our own State University which is of great value, also a bulletin published by the Louisiana State Experimental Station, located at Batton Rouge, another at the State Experimental Station of Florida, at Lake City; others from the stations at Columbia, Missouri; College Station, Texas; Auburn, Alabama. Another mite is the little fellow which infests the walnut tree, but it is not worth consideration. As to the spiders and scorpions, Prof. Cook maintains there is no injury of account from them. Never worse than a bee sting, and then only from one variety, a small black spider with red spots.

* * *

In the absence of C. C. Teague who was programmed for an article on "Shall we Rebud our Lemons to Oranges," a general discussion was called for and was led by Mr. Blanchard of Santa Paula. Mr. Blanchard thought that if the conditions were favorable for the growth of lemons it would be a mistake to rebud. Lemons are more delicate than oranges, require greater freedom from frosts. There is also an advantage secured to large growers of lemons and a greater ease in selling small quantities of oranges than small quantities of lemons. So Mr. Blanchard thought that lemon production is more profitable in a large way. He also thought that near the coast where the conditions favored continuous growth of lemons, which is a great advantage over the interior points. Mr. Kahles of Santa Barbara, seconded Mr. Blanchard's remarks, especially with reference to the small growers being at a disadvantage. He referred to the Santa Barbara Fruit Exchange, which at one time handled large numbers of lemons, being almost dissolved now. Mr. Heintz asked as to limes, but Mr. Kahles thought that they were not produced in sufficient commercial quantities in California. Mr. Harwood has lemons, five acres of them, which he says he will not rebud, although some years there is an almost total failure of the lemon crop; for five years the lemons have proved more profitable than the oranges.

Asked as to his favorite variety, Mr. Blanchard said they were Lisbons, Eureka, and Genoa. He said that his Lisbons have proved his most profitable fruit but he said that Lisbons varied greatly, some having much shorter thorns than others. J. H. Reed of Riverside, said that the small growers in Riverside had just as much advantage as the large growers. There they co-operated and 500 acres of lemons have every advantage that 500 acres of oranges would have. He spoke highly of the Santa Paula method of curing lemons and felt that a debt of gratitude was owed to Messrs. Teague and Blanchard and others who had introduced and given that system to California. Mr. Stone of Pasadena, had rebuded lemon trees to oranges but felt that he had made a serious mistake, and should he remove apricots which are now planted on his place would replace them in lemons. He also spoke highly of the worth of the new system of curing lemons, and felt that our trade would be more favorable if we had more lemons to fill the market, and drive out importations.

Mr. Day of Pasadena, referred to the Davene's wraps and thinks it may have a future in store for it.

* * *

DIVISIONS OF PLANT LIFE.

Prof. McClatchie in his talk on plants repeated much of his first lecture. One point which he did not mention before was the different manner of studying plant life; First, as to their structural makeup; second, classification; third, physiology; fourth, uses or economy. He also referred to the different divisions into which plant life is placed, as species, genus, families, etc. Species are again divided into varieties, that is, potatoes, of the different varieties make a species, apricots the same, etc.

Referring to the great branch of vegetable life he said that there are some five or six different great branches. The branch which he studied in his first lecture was the protophytes or first life. This is divided into three groups, micrococcus, bacillus, spirillum.

There is no plant but has the power of motion, and many of them have the power of locomotion, these of course are the water plants. There, motion is such that the distinction between the vegetable and animal life has been very difficult. In fact, there is no definite line between them. This makes it especially hard to distinguish between the lower forms of animal and plant life.

NO RACE SUICIDE.

The omnipresence of Bacteria, and its infinite smaliness was shown by the fact that many of these varieties of bacteria, by actual measurement with the miscrope are only about one ten-thousandth of an inch in diameter, and many are only one-tenth of that infinitessimal size. The increase is so very rapid that while only one or two of the bacillus which cause anthrax of cattle, may enter the veins of an ox, the millions upon millions which have grown will cause the death of the animal within twenty-four hours. The next form of life he again took up was the green slime, "frog spittle" and algae or sea weeds. One of the most interesting parts of his talk was his reference to the algae, of which he showed specimens. He also showed a specimen of a rather small leaf of the brown algae which sometimes grows to the enormous length of 1000 feet, and said to the the longest plant growth in the world.

Another very interesting thing of which he spoke was the chlorophyll and other coloring matter in plants. He said that the blue or other colors help to diminish the power of the sunlight, and the red to increase the power of the sunlight, so, for that reason, the red sea weed was always found in the deepest water, and the

blue or green was always found in the shallowest water. He also said that plants will change their color, in time, by being transferred from one country to another, and that they have apples in Phoenix which are of red varieties and should be a deep red, which are all bleached, and have very little if any red in them. This is because of the intense light which is greater than the fruit requires, hence the fruit adapts itself to conditions and receives less light by being bleached.

* * *

TUESDAY AFTERNOON.

Will crude carbolic acid cure gum diseases? And in what proportion shall it be used? Half water and half carbolic acid. Diseased part should be scraped away before applying. Mr. Blanchard preferred a paste made of lime, carbolic acid, and water. Mr. Allen preferred a paste made of one cup lard, stick of phosphorous, with sufficient dry paint added to make of the consistency of paint. Mr. Dreher, Jr., preferred lime, sulphur, and carbolic acid made into a paste.

What is the cause of the mottled leaf in the orange? Lack of water. Too much water. Lack of nitrogen. Too much nitrogen. Lack of humus, and many other answers were given. It was decided to be a case of general plant dyspepsia.

Prof. Loughridge talked almost entirely on the mechanical make-up of the soil, especially as to the necessity of humus in the soil for all plant growth. This must be given special attention in California, for here the soil is lacking in that element, while in many of the eastern states the average contents of humus in the soil is 5 per cent., in California it is sometimes as low as one-tenth of one per cent. The amount of humus in the soil seemed to be determined in a large part by the number of earth worms. They introduce nitrogen into the soil, for where they are scarce, humus is scarce. It may be increased by an application of coarse manure, but the Professor thought the best and cheapest method was an application of green manure. It helps to secure ventilation or aeration, of soil, also to hold the soil elements ready for the solution by water. Humus may be destroyed in the soil by too much cultivation especially in the hot interior valleys, where it is brought to the surface constantly and is burned out by the sun.

This lead to a discussion of stable manure, and Mr. Davenport was asked if stable manure was good for orange groves, and he gave an instance in which he applied it on his ranch in Pomona, with wonderfully profitable results. He applied large quantities of barnyard manure with the results that the trees were made much stronger in growth, with a very large quantity of fruit which however, was not of the very best quality.

A WARM DISCUSSION.

A discussion on Mr. Allen's paper proved one of the warm numbers of the convention. Some of the heat which he mentioned in the first paragraph of his paper was shown to be present in a very active state. It was, however, confined to one person whom Mr. Allen charged with being the employed agent of the cyanide syndicate.

A challenge to battle resulted to no blood shed, and the course of distillate, also cyanide are now moving in the even tenor of their way

In answer to the question as to much damage which is caused by the distillate spray, Mr. Allen said that much of the spraying was improperly done, or rather, done with improper materials. The distillate must be clear and of a high grade. He said that he had seen some that was the color of tar, and thought it must contain asphalt. Of course, such stuff as that will ruin the fruit and endanger the life of the tree.

AT RIVERSIDE.

Mr. Cundiff of Riverside, spoke at some length regarding the investigations, and though the report exceeded the five minute limit which had been established by unanimous motion, and then he was requested to read the report. We must say that this report has shown the belief of the committee in the distillate spray. That is out of 900 acres investigated, owned by sixty-three persons which were interviewed, there are only a very few that had any serious injury to the fruit or dropping of leaves; but in the main the damage was very slight, and the results on the scale most effective. These investigations were in charge of a committee of ten, who placed the active work in the hands of a committee of three, consisting of Messrs. Cuttle, Everest, and Koethen. On the whole Mr. Cundiff thought that the success of the distillate spray, is far greater than that of gas in its early day.

Mr. Day called attention to an exhibit of lemons in which there was a quantity of red scale, which had been sprayed some months ago and also some weeks ago. He asked Prof. Cook to investigate, and Prof. Cook said that without question there were live red scale on the fruit and branches. Mr. Day believed that on the red scale the gas had the preference. Asked as to what he believed of the effect of the spraying, Mr. Allen said that he had absolutely no experience with that particular scale. Mr. Day said that many fumigators are too sparing of their cyanide and also said that he knew of one of the most successful fumigators who had used a large quantity of water, four times as much water as acid. Ex-Governor Sheldon said he had no direct interest, but felt an interest in the welfare of the state. Thought the matter should be fully investigated, and the results reached should be accepted. He did not think spraying philosophical. The spray he thought did not penetrate as does the gas.

ANALYZE DISTILLATE.

Mr. Dreher of Pomona suggested that an analysis should be made of the particular distillate that proved successful. And a demand for material that shall come up to the standard would be the best way to secure uniform results from spraying. Mr. Stone of Pasadena replied to Gov. Sheldon's request for experiments, and called his attention to Mr. Allen's explicit statement that his conclusions were the result of fact, developed by years of experince, first with gas and later with spraying. Gov. Sheldon replied that if this be true, let the results be accepted and the established heat allayed. Mr. Stone also felt that the importance of the matter was such that the State University, with the Farmer's Institute funds, should make a thorough investigation of these matters and give it to the fruit growers in a bulletin. Prof. Loughridge replied that there have been investigations both in the matter of gas and spray, and bulletins are now being issued. The bulletin on fumigation already being distributed. On motion of Mr. Day, a unanimous request was made that the University of California send competent men to make thorough investigations.

Mr. Heintz then took the floor, and asked Mr. Allen if he had any scale at all on his place. Which Mr. Allen had, and as he also said afterward, that he had house flies too. This pleased Mr. Heintz, who said that he had a report from a committee which he had sent to make investigations, and that he had found trees in Mr. Allens ranch which were in a very bad condition as result of spraying. Mr. Allen said that his trees were not in a bad condition, as a result of spraying, notwithstanding Mr. Heintz's report who was the paid agent of the cyanide trust. This Mr. Heintz denied, and suggested that they withdraw to the street.

Mr. Reed of Riverside said that the investigations of a committee which had been appointed by the Riverside fruit growers was not conclusive, but merely looking toward securing the most information possible. Thinks that so far spray is deemed best for the conditions existing in Riverside.

MORE CHEMISTRY.

Prof. Loughridge then continued his talk on chemistry of the ranch, basing this day's lecture on the composition of the soil. There are five ingredients of the soil. That is, from the original rock formation to plant food. First is the rock powder, which no matter how fine it is pulverized by the air and moisture, is not plant food. Second is silt; third, clay or silicate of aluminum. Clay is a result of decomposition of mineral matter. A soil which presents 40 per cent. clay is exceedingly hard and difficult to work; containing 10 per cent. clay makes a nice sandy loam; one containing 3 to 5 per cent. makes a sandy soil. Fourth is humus or partially decayed plant food, and fifth is the plant food. There is a large amount of vegetable matter in soil which is not yet humus.

The physical condition must be correct, and the soil should be deep. The conditions in California are very much varied, but as a rule the soil is exceedingbly deep, so much so that an alfalfa root was found at a depth of sixty feet, in an adobe soil, An almond root at 30 to 40 feet. Deep soil means that water must be forced far below the surface. No matter how deep that water may be, all plants have the power of lifting it from great depths.

The Professor referred to the soil analysis of which he has charge, in the State University, and said that farmers sending in samples for analysis should take an average sample, at least a quart, to the depth of four feet. That from the top to be kept by itself,and state the general conditions, and as to whether the analysis is desirable to determine the fertility, the presence of alkali, etc. The best thing to do in this matter is to write to the Professor at Berkeley, for bulletin of instructions, which are forwarded to all wishing soil analysis. About 500 soil analyses are made each year.

* * *

TUESDAY EVENING

What is the cause of oranges turning green after ripening was referred to Prof. Loughridge, who answered that there was probably an excess of nitrogen. Mr. Reed of Riverside thought our orchards were in poor condition, and Mr. Hirschfeldt of San Jacinto thought that wet ground would be the cause of it. C. C. Chapman said, "It is more noticeable of the young trees. With trees which have god continuous care the danger is lessened."

Are house plants healthful? Decidedly they are, and add so much to the beauty and happiness of the home. Mr. Pratt wished to know if they gave the proper conditions, say in the sleeping room. Mrs. Sherman thought they were not at all harmful.

How can we get more beautiful homes in Caifornia? Mrs. Sherman said aid by being neighborly and supplying seeds, and roots to those who were not able to buy. She said be enthusiastic yourself, it is catching. Be neighborly. Above all keep your own place neat and beautiful.

Mr. Braunton continued his talk on Floriculture. The rose is the most loved and the least understood of any of our flowers. We shoud give it the same rest as it has forced upon it in the East, that is from July 1st to about October 1st. The manner of doing this is fully given in Mr. Braunton's Floricultural Department this week. After the rest the rain comes and it is thoroughly soaked by irrigation about Novemebr 1st, and when fully started is then given thorough fertilizing, and then a magnificent crop of early winter bloom will follow.

The ten best varieties of bush roses for Southern California were given, also the six best climbers. Those lists with descriptions, colors and conditions for the best growth, etc., will be given by Mr. Braunton in the Floricultural Department next week.

* * *

TUESDAY EVENING.

C. C. Chapman of Fullerton read a paper on "Care in Handling Citrus Fruits." He said that an orange should be picked when at its best, that is, navel in its season and Valencia in its, and not picked after rain, because it will decay. Regarding kind of boxes, Mr. Chapman also said that farmers must never use an ordinary packing box for orchards. It results in injury to the fruit and if it is sent to market in a dirty box a loss far greater than if a clean box had been purchased in the first place. The box must also be provided with end cleats. The ambition of some men to have their boxes picked especially full results in great loss from bruised fruits.

To handle fruit in the orchard properly, one should have a good ladder, with broad steps, wide base, and should be taller than the trees; also clippers to cut stems closely; picking bags, which do not hold more than half a box; springs on wagon, and last but not least, good roads. Care should be exercised in lifting from the wagon at packing house. There should be rubber tire trucks, and there must be care in emptying, brush ng and sizing.

MORE INVESTIGATION.

Mr. Reed of Riverside spoke of "Our State Agricultural Deparments and

DID YOU EVER

try any of our canvas irrigating hose made in our own factory and covered with a waterproof coating? We make it from the very best army duck, in sizes from 2 to 10 inches and the prices are from 2c per foot up. It's the best hose for the purpose ever produced.

Hoegee's Irrigating Hose

has a reputation all over the west and our business is continually increasing on this hose. Once tried—always used. Try a short piece—you'll want a longer one next time. Send for our hose price list—also our hunting, camping, yachting or sporting goods catalogs if you're interested.

WM. H. HOEGEE CO.

138-140-142 So. Main St., Los Augeles, Cal.

Manufacturers of Fumigating Tents, Fruit Picking Bags and everything conceivable in Canvas Goods.

the Rancher." Mr. Reed did not make this a criticism upon our state industries and said that he had, "no criticism, only he wanted to ask if it may not be more complete.". The growth of this work is wonderful. There are as yet comparatively few who have been benefited. People persist in following the beaten paths. In France agriculture is taught in 3000 primary schools, and in many of the more advanced institutions. It is more practical to teach our children the rudiments of agriculture as the arts and languages. May not the State University accomplish much more for us in this and other lines.

We may have the soil analyzed. To the scientist this seems simple; to the orchardists, many of whom seem unable to grasp the matter readily and there is disappointment, so he will not experiment for himself. Questions of many years ago are still unsettled. After all the bulletins on fertilization, not one farmer in twenty uses fertilizers with any assurance of success.

Expert investigations must be entered into. The decaying of citrus fruit is enormous. Some of the causes are known but not fully appreciated. This investigation is expensive, so is the terrible loss of the vast amount of fruit. Such investigation would have saved $400,000 on last season's shipment alone . This should be provided for by special appropriations. Decay in transit, fertilizer, and insect pests should be fully investigated. Is it not time to petition for this work to be taken up?

To devote money to charity is philanthropy; to devote money to investigation is statesmanship.

Prof. Loughridge called attention to the great work already done by the State University, especially referring to codling moth and peach worm investigations.

* * *

WEDNESDAY MORNING.

The Long Beach brass band livened up the opening with some excellent music and after the usual opening exercises, Prof. Cook took up the study of insects. The Professor's talks are following much the same lines as the articles in the "Cultivator," so we give then only a mention, but the interest with which the people follow his talks is really gratifying. This morning's talk was largely regarding ants. He spoke of their high development, or more particularly of their brain power, in fact they seem to have a social system of their own, working along cooperative lines, as near as can be determined from close study, they have slaves and they use aphids to supply them with food, much the same as we do our dairies.

FOREIGN MARKETS.

Thomas Stone of Pasadena spoke on the subject of extending our foreign markets. Mr. Stone is nothing if not optimistic and considers that we have not yet thoroughly developed our foreign markets for citrus fruits. Mr. Stone based his talk on his investigations made on a recent trip to England, at which time he visited the great fruit market of London, and found it almost impossible to get California oranges, and when he could do so by paying ten to twelve and a half cents each Mr. Stone referred to the recent estimate of 35,000 car loads as next year's output, but did not consider that, of the possible 50,000 which it may reach in a few years as anything to be alarmed about from a grower's standpoint. The market is so little exploited in Europe and practically not at all on the continent. There should be not only agents in London, but many agents in the larger cities of England, and on the continent.

It will not do to continue our present apathy, and wait until the demand forces us to export our fruits, but we must enter the markets and compel the trade to supply the people of Europe who are able to pay for good fruit, to eat Washington navels. He thought the present fruit agency represented a vast number of orange producers, and should be on the lookout to take up this work, and exploit foreign markets. He said that within a forty mile radius of the city of London, there were eight millions of people. Not all these would be able to buy Washington navels, but the vast number who would be, would consume a large quantity of the best California fruit. It is probable that on the continent there is less opportunity for developing markets than in England, notwithstanding that it would be no more startling to send navels to France, or to Spain where oranges are now produced, than it is to send prunes to France. The speaker was enthusiastic enough to believe that a still further extension of the markets could be possible into Russia, and even Siberia, China, and in fact all of the Asiatic countries.

In the discussion Mr. Stone was asked as to the cost of getting this fruit into these markets. He said that the cost to place fruit in London would only exceed the cost of our getting the same into our Eastern markets by about 30 or 35 cents . The worst feature was the matter of time which the transportation companies should aid in overcoming.

TIME LIMIT.

Mr. Dreher of Pomona also spoke of the time limit for handling perishable fruit as the principal factor. Good care in orchards and packing houses and quick transportation would give an entry into foreign markets. What may we expect in the effort to enter foreign markets, when our fruit does not even carry to New York? One speaker mentioned a box of oranges expressed to Calcutta which were six weeks en route and arrived in good condition.

Mr. Reed of Riverside felt that we should not lose sight of the fact that we have greater development of our own home markets. Mr. Davenport of Long Beach referred to the time—fifty years ago—when apples in New York sold at $2.50 the wagon load, and there was a fear that in time there would be an over production. Yet today apples command several times that price.

Mr. Johnstone of San Dimas has 100 acres of oranges and lemons and is decidedly hopeful for the future. He thought, however, that Europe would make a good market for our "big offs." The coming year he deems a good one for developing new markets.

J. S. Edwards of Redlands read his paper on co-operation, in which he took for his text, "Is the servant greater than his Lord?" It was a satire upon the present conditions with occasional raps at the California fruit agency or more particularly the citrus union for the recent combinations in which the growers, which we consider the master, has been considered less than the servant. He said that he favored co-operation of and by the growers. The discussion on this paper was deferred till afternoon.

Prof. McClatchie continued his talk of plant life, taking up the fungi. He spoke of their lack of chlorophyll or any other coloring. The fungi lives only upon organic matter, usually upon that which is decayed. There are two kinds, one is the parasitical, and the other is the saprophytic. In Arizona where the Professor lives, there are an exceedingly small number of fungus plant; tomato blight, crown gall, and some others.

The blue mould such as appears on stale bread and other places are everywhere present, even every breath which we draw may take in the spores of this mould. High temperature will kill the spores of all fungi, but it requires a higher temperature than does the bacteria. In the canning of fruit where there was sufficient heat to destroy all bacteria, so that the fruit remained sweet there yet remained spores of fungus growth as is seen at the top of fruit, sometimes covered with mould.

Mildew is different from fungus growth in this, that it will live on living matter. The mildew of the grape, rose leaf and others were mentioned as examples.

The yeast plant is a fungus which when placed in the dough of the bread and given a high temperature increases with enormous rapidity, creating in its growth alcohol. And when placed in the oven all the yeast plants are killed, the alcohol is driven out of the bread by the heat, and it leaves the empty cells that the germination of the plant had created.

* * *

WEDNESDAY AFTERNOON.

The first question out of the box was, is it a fact that oranges picked from the same trees during different seasons of the year have different qualities? Decidedly yes. Those picked while the trees are in bloom, or after the heavy rains are not so good. Mr. Dreher also added that fruit picked from the inside of the tree is much better than that picked on the outside.

Must dewberries be trained up on a trellis or may they be pruned back? The best results are obtained by training them low on wire supports.

What is the best earliest dewberry of this section? The earliest berry of this section is called the "Mortgage Lifter," brought here from Austin, Texas. This will sometimes bear in January and February, but always exceeding the earliest; but by far the best berry is Gray's Gardena Dewberry.

Has sulphate of iron any fertilizing value? None in the least.

What is the dust spray? Mr. Hall replied that San Diego county had used the dust spray for applying fungicides and insecticides. This is often effective and economical when used in hilly sections or where water is hard to get. Application should be put on mornings and evening when the leaves are moist. Mr. Taft of Villa Park has used them largely in New York and thought they were considered effective there.

What will kill cabbage worms? Buhach or Paris green. Through the possible danger of the latter, the former has the preference.

Is there better insecticides for chicken houses than crude carbolic acid. Prof. Cook preferred the lower grade distillate which is the cheapest and best he knows of. Dr. Sherman of Fresno recommended the addition of a little creoline.

Is the "Blue Curl" or turpentine weed, of value to keep away chicken lice. Mrs. Sherman said it was largely used about Fresno. Dr. Sherman tried it on calves and they ate it all up.

Secretary Reed, of the Semi-Tropical Fruit Exchange spoke in place of Mr. Naftzer, who was unable to be present on account of ill health. He reviewed the history of fruit marketing, referring back fifteen to twenty years ago when there was no occasion for the exchange or the commission man. The market readily absorbed every orange that could be grown at a price that would now make the mouth of the orange grower water. Later there seemed to be combination among the buyers, which finally merged the whole fruit buyers so that some ceased to buy, and the commission business came in, and then came disasters. One grower shipped twelve carloads and found himself in debt to pay the freight and expenses of these car loads and above all receipts of fruit, to the amount of $1800. It became necessary to do something. Over ten years ago the Exchange organized, and since then has had control of from 30 to 60 per cent of the fruit. A discouragingly large number of people hold their fruit outside, which is used to beat down the prices of the Exchange. For the first three years the f. o. b. plan was the only manner known for selling fruit, but the disastrous results under this system caused a change to the selling delivered. This plan was followed until April of this year, when a joining of forces with the California Citrus Union, an organization of the fruit shippers was effected.

In the discussion which followed Mr. Reed's paper, Mr. Stewart of Redlands wished to know that if the Exchange had been unable to control the markets, when it had 40 per cent. or thereabouts, how could it expect to with only 60 per cent, Mr. Reed replied that doubtless the percentage would be above 60 per cent(but the more fruit there was under control, the less conflict there would be. Mr. Chapman wished to know if any new members would be taken into the Exchange Mr. Reed replied that there certainly would. Any purchaser of orchard property, always having the option though of putting their fruit either through the Exchange or citrus union, as he might prefer, also under certain limitations others had the privilege of joining either organization.

Mr. Cutter of Riverside , thought that it was inconsistent for the Exchange to join hands with an organization which had worked along lines which the Exchange had always condemned. Mr. Reed replied that the fact is the Exchange had labored in vain, urged, and begged the different growers to join in and make a success which might be secured by handling a large percentage of the fruit. These growers had seen fit to remain out all these years, and now it is no time for them to file their complaints at any action the Exchange may see fit to take.

* * *

WEDNESDAY EVENING.

What is the value of grape cuttings as a fertilizer? But very slight, if any. Burned and the ashes spread would give quicker and better results.

What is the future of grape fruit? No very encouraging answer was given to this question.

Mr. Braunton spoke of wild flowers of California. Aiming to give no comprehensive list but showed specimens of ordinary flowers which were possessed of great beauty. The first plant which he exhibited was the Blue Curl, or common Turpentine weed, spoken of some weeks ago by Mrs. Basley in the poultry department of this paper. The odor of these plants was so strong that it was very noticeable all over the room.

The first plant spoken of was the Woodwardia fern which is largely grown in California. Mr. Braunton said that this was a good time of the year for planting them as the roots were nearly dormant, likewise the roots of the beautiful native maiden hair fern, may be secured from the mountains. Scarlet Larkspur is a beautiful plant which he showed. Mr. Braunton said that he would supply seeds to any one sending a self addressed envelope to him. Matilija poppy, California cream cups, climbing milk weed, mariposa lily, the common California poppy, and other plants of great beauty should be appreciated by California culturists, as they are by the German gardeners, who send here for large quantities of these seeds.

VEGETABLES.

F. Kahles, of Montecito—"Prof." Kahles—said he was no vegetarian, yet he believed in Californians having their own vegetable gardens. He showed that it was a vast deal cheaper, and that he could get much fresher and better vegetables than he could from the Chinamen, who he said did not know a little bit about gardening. He said that by his books which were carefully kept as to the cost of gardening and the cost of supplies of the house and for his men, he knew that a great saving was effected from gardening. And that while the garden truck cost something more than when he purchased, it made his butcher and grocery bill far less, by the more liberal use which was made of garden stuff when it was fresh and crisp.

FROST PROTECTION.

Dr. E. W. Reid of Iamosa, read an article on frost prevention which we will give in full at some later date.

Prof. McClatchie gave an interesting talk on experiment stations, the good done by them and the greater good which may be accomplished for the farmer.

* * *

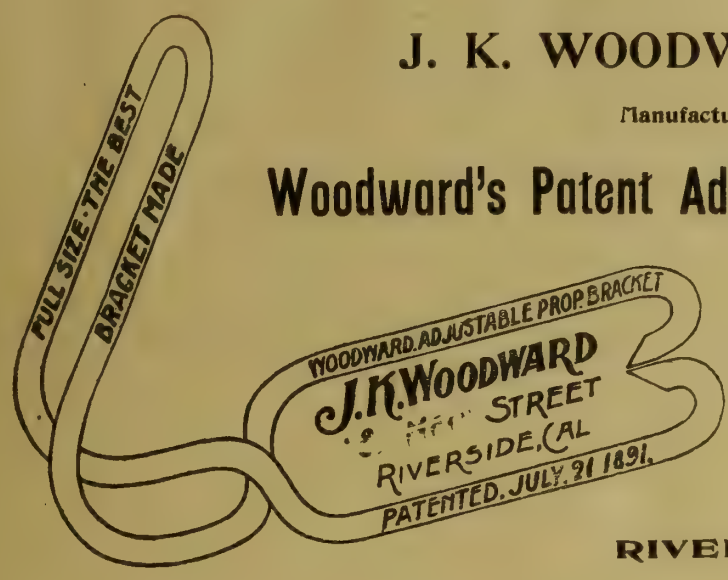
THURSDAY MORNING.

Prof. Cook opened with Insects and Prof. McClatchie continued his talk on the lower forms of plant life confining this morning's lecture to rusts, smuts, lichens, toad stools, and puff balls. This subject he said was but little interest economically to farmers, yet should be of greater interest because it appeared about them on every side. The rust of wheat is a most interesting form of plant life, and is distributed widely, and the growth sometimes becomes a serious pest in localities where the atmosphere is damp. Smut of grains is a growth which may start with the seeds, and then proceeds to the stem, until it matures in the grain, and appears as a great mass of smut, to the serious detriment of the grain. Lichens grow on trees, rocks, and elsewhere, but it is not a parasite, but gets the substance for its growth from the algae surounding them, and living on the increase of the plant. Toad stools and puff balls were merely referred to, and the professor said that all were edible except one variety, and that they were very nutritious food. The one variety, however, is a deadly poison.

Elwood Cooper's paper on Food Adulteration, Mrs. Sherman on Successful Grape Culture and other of the papers will be quoted from next week.

Also at that time will be given the committees with their reports, resolutions, etc.

J. K. WOODWARD A. A. GAMBLE



J. K. WOODWARD & CO.

Manufacturers of

Woodward's Patent Adjustable Prop Bracket

The Only Bracket
That Will Fit Any Size Prop

171
NINTH ST.

RIVERSIDE, CALIFORNIA

GENTLEMEN:

As we are about to open the propping season we wish to call your attention to the Woodward Adjustable Tree Prop Bracket. You well know its merits over all other Prop Brackets, so we do not have to go into any lengthy details. Our prices the coming season will be $17.00 per M. retail. Same discount to the trade as formerly.

We have a large stock on hand and can fill all orders promptly. There are millions of them in use in Southern California.

We have been making the Woodward Prop Bracket for thirteen years and they have given better satisfaction than any bracket made. Try them once and you will always use them.

Remember our reduced price. Ask for Woodward's, for they are cheaper and always reliable.

Shall We Extend Our Citrus Groves?

By N. W. Blanchard, Santa Paula.

To intelligently answer this question, we want to view the past, the present, and forecast the future as well as we can.

What I shall first say bears upon the orange, not the lemon industry.

The following is a statement of orange and lemon shipments for the past eleven years.

Season.	Lemons. (Cars.)	Carload. shipments.	So. Cal. shipments.
1891-92		4016	
1892-93		4400	
1893-94		5871	
1894-95		5022	
1895-96		7575	
1896-97		7350	
1897-98		15,840	15,153
1898-99		10,875	10,351
1899-00	1447	18,460	17,809
1900-01	2913	24,954	24,096
1901-02	1736	20,387	17,387

The cars of lemons shipped in the last three years were 1447 cars in 1899-00; 2913 cars in 1900-01 and 1736 cars in 1901-02, and included in the shipments respectively for the same years given above. This year's crop will probably reach some 22,000 carloads.

Good judges of the citrus industry are estimating next year's crop of this state at from 30,000 to 35,000 carloads, barring unforseen accidents. The bulk of this must be sold in the five months beginning with February and ending with June; say 5000 cars per month, an amount per month equal to the whole year's crop of nine years ago; can the railroads move the crop? Can the fruit be sold at a profit?

Besides this amount of fruit, Florida's crop for next year is estimated at two millions of boxes, over 6000 carloads. Florida has made another start in the growing of oranges since the great freeze of some years ago, that practically wiped out the industry, and when it raised about as many oranges as California now produces, and the growers have now located their orchards further south in the state and in warmer localities, and are making great strides towards their former large output.

The citrus crop of two years ago, 24,954 cars, less 2913 cars of lemons, was 22,041 cars of oranges, 35 per cent. above the previous year's crop, which, itself, was the largest crop ever grown in the state up to that date, 1899-00. The orange grower fared very badly and the profits were so small that it was an unremunerative year to many growers. It should be said, however, that the carrying qualities of the oranges were poor that year.

A year ago our citrus crop was 20,387 cars, from which take the lemons, 1736 cars, which left 18,651 cars of oranges. The fruit was good and sold at remunerative prices and the year was a profitable one.

This year the fruit was coarse and not sweet in the early part of the season, and the demand, in consequence, was not sufficient to take the shipments at the usual prices, and shipments were held back until the oranges became so ripe that they had to be moved. May shipments of this year were 3405 cars as against May shipments of last year of only 1486 cars, and the consequence was the markets were flooded, were so overstocked that many cars did not bring freight and packing charges.

The lemon industry, notwithstanding the losses of the past by many in growing lemons, has a bright future for some years to come. The land in California suitable for lemon culture is more limited than that for orange culture. I do not know if the lemons do so well in the tropical regions as oranges. Our hot valleys cannot compete in lemon culture with the region that has a more cool and equable climate, nearer the ocean.

The present amount of lemons grown in the state is about one-third of the amount consumed in the country, and the new method of handling lemons and the successful keeping of them from the fall and winter months until the summer months, when they are most wanted and most valuable, makes the outlook for lemon culture much more promising than that of oranges.

Fumigation or Distillate Spray?

By R. C. Allen, Bonita.

Most of us citrus fruit growers from the sea coast as far back as Riverside have occasion to ask ourselves: Which shall it be? and we don't all answer the question the same way. Indeed, in some localities there seems to be a battle royal over this matter; but I am bound to say that most of the heat in this argument is shown by those who favor fumigation—more especially those who sell cyanide. The mystery is why, if distillate spray is the destructive and wholly evil agent it is claimed to be, they cannot trust to its early abandonment. The orchardists of Southern California have been generally accounted a fairly intelligent body of men and one would suppose that they could be trusted to drop the use of a process which is ruining their orchards without the necessity, on the part of those whose financial interests are touched, of maintaining an organ and flooding the country with circulars describing the injurious work of distillate. Indeed I may say that one of the first things that convinced me that there must be real merit in the distillate was the very evident fear of the cyanide people that something at last had been found which would be a serious inroad on their monopoly.

The fact of the matter is that both these methods of coping with the scale pests are valuable, and that the circumstances of the case will determine which is the proper one to use. It is not necessary to choose between an evil and a good, but between a good and a better, whichever way one may chance to think. Experience has not, perhaps, even yet gone far enough to say in every given case which is the better remedy. Fumigation, properly done, is a very perfect and satisfactory method where the hatch of scale is even and all can be caught by one operation; where the hatch is uneven, it is likely to prove too expensive. Not many growers feel that they can stand two operations each year.

For some eight years I relied almost entirely on fumigation and generally with satisfactory results. Starting when the trees were young, it appeared to be an easy matter to keep the scale in subjection and I was encouraged to believe that an annual fumigation would keep trees and fruit commercially clean. The orchard, however, being in the coast district, I found the scale gradually encroaching on me and at last I reached the point where at least two fumigations each year would be necessary. I came to the conclusion that the business would not stand it and that, even if it would, there was no sense in throwing away money, if something else would give equally good results more cheaply.

I experimented with distillate emulsion, but found it uneven in its results both as to effectiveness and as to spotting the fruit. Then came the new process with distillate spray. After one year's experience with this I can say unhesitatingly that even a single aplication gave me better results than a single fumigation ever did, and at only one-third the cost. Fumigation within its area of effectiveness ought and probably does kill a greater percentage of scale on a tree than the distillate spray will; yet its range is not so great as the distillate, for the latter will kill some scale of all stages and is especially destructive of the young and eggs at the hatching period. It is true that gas will kill the young where the shell has begun to lift, but it cannot penetrate the egg. I tested this point very thoroughly once, with both the black and purple scale. Enough gas was used to singe the foliage. The scale was in process of hatching and the old shells literally full of life. After the tents came off I examined specimens daily under a compound microscope. Each scale was a perfect shambles with the corpses of the young mixed in with the unhatched eggs. Up to the tenth day no new life appeared and I began to hope we had made a clean sweep; but on that day the eggs began to hatch and we soon had enough young scale to stock the orchard, and a second fumigation would have been required for satisfactory and thorough work.

The action of the distillate is different. Its oily nature assists it to work its way under the edges of the scale and once there it is goodbye to both young and eggs. There is nothing left to tell the tale. Taking into consideration the greater range in the life of the scale in which the distillate can do its work, I believe that this spray will kill a greater percentage than fumigation will, where the hatches are badly mixed, although, as said above, if the scale is of one stage—and that the right one to treat—the latter will kill more, owing to its greater perfection of application.

Looked at from this standpoint fumigation is likely to find its advocates in the interior; spraying near the coast.

I cannot see that the distillate, used in the right proportions and properly applied—does any injury to a healthy, vigorous tree. A three per cent mixture seems about right for lemon trees and two to two and a half for orange and grapefruit. There may sometimes be a slight defoliation, but this is no more serious than the tipping back of the tender shoots with fumigation. In such a case the leaves which fall are those which would soon have dropped in the course of nature and have already ceased to perform any function. If the loss of leaves is serious, it shows either bad work or a condition of the tree such that it should not have been treated.

It may show that an improper material has been used, for not all of the distillate put up as tree spray is fit to use.

* * * * * * *

The merit of the distillate spray has been so abundantly proved, that failure must be laid at the door of the man doing the work. With a good machine, the right material and careful application, the result is certain. The large orchardist should own his machine and smaller ones should club together to buy one, so that the work shall be done by the parties in interest.

* * * * * * *

Now I find that the distillate spray is effective with not only the scales but the mites; not only the red and yellow spider but the silver mite, more to be dreaded than any other pest, for it wholly ruins the fruit and seriously injures the tree.

So far I have considered the distillate spray chiefly in its relation to lemon orchards in the coast district. for them it is an unqualified success, and will, I think, be the accepted remedy for scale pests and mites until something better is discovered. Taking into consideration its cheapness as compared with fumigation, I should expect to see it the favorite for lemon trees in all sections.

* * * * * * *

In regard to the use of distillate spray with orange trees I have not had experience enough to speak with confidence. As they require a milder dose it is evident that in so far the result will be less satisfactory than with lemons. If the hatch of scale is uniform, and we are dealing with one variety only—say the black—I believe that fumigation will give the bettter result, because under such circumstances one operation ought to do for two seasons. On the other hand if we are dealing with several varieties of scale or the hatches are uneven, it is likely that the cheapness of the distillate spray will more than offset any advantage that fumigation has. In fact the great expense of fumigation is only justified, even with orange trees, when there is a fair prospect of making a clean sweep, and thus spreading this expense over two or more seasons. In the work that I have done with oranges and grapefruit the spotting has been scarcely noticeable and not enough to injure the marketable quality of the fruit.

To conclude, whatever further experience may show with regard to the value of distillate in the interior country and in cleaning orange orchards, we already have abundant testimony that to the lemon industry of the coast it is a valuable friend which has removed an obstacle that seemed to threaten its very life.

IN THE POULTRY CITY.

Petaluma, Cal., July, 28, 1903.

Editor California Cultivator:

The magnitude of the poultry industry on the Pacific coast cannot be understood until one has visited Petaluma, the great poultry center. There the principal part of country life is the raising of chickens, and one may go in any direction and see nothing but chicken ranches, varying in size from 1000 to 12,000 laying hens. I am told that the net income of the average poultryman is from $5 to $60 a day, according to the capacity of his plant. Something can be learned on almost any poultry ranch, but the most interesting spot to visit while in Petaluma is the big plant of the Must Hatch Incubator Company. There one can see in process of manufacture all that is latest and best in appliances for successful poultry raising, incubators, brooders, and the many details of modern invention for the properly conducted chicken ranch. It is beyond my ability to describe this wonderful plant and I will merely say that it covers a whole block in Petaluma the various parts of manufacture being housed in large buildings peculiarly adapted for the purpose. In addition to the factory proper, which is equipped with the best machinery, yet intended for making the different parts and articles turned out in such great quantities, there is a large hatchery, which has a hatching capacity of 15,000 chicks a month. Then there is the big brooding house, where 9000 chicks may be seen in various stages of growth, thus practically demonstrating the excellence of the products of the factory. The quarters for the laying hens contain some of the finest specimens of the White Leghorn, the great business hen. The practical part of poultry is still further carried out by the Must Hatch people on their large ranch two miles from town, a visit to which adds considerably to the pleasure of one who has inspected the town plant of the company, as he can thus see all parts of poultry management in its present advanced stage of excellence. The incubators on this place are now being filled with eggs for the fall hatch, as it is now claimed that fall-hatched chicks are the most profitable. It is true that the hatches in the fall are usually small, owing to the low percentage of fertility of the eggs at that time, but that is made up by the rapid growth of both the chicks that do hatch and the money-making pullets that come in just at the right time to help fill the egg basket, when eggs are high in price. The principal seasons for hatching in and around Petaluma are the months of August, September and October, and again in January, February and March, and some in April. I have enjoyed my visit to Petaluma very much, and must say that the best advice I can give to a poultryman, beginner or old hand, is to tell him to go and see what I have seen.

LIVESTOCK AND THE DAIRY.

By Leroy Anderson, Director of the California Polytechnic School, San Luis Obispo.

In April last the secretary of the Guernsey Cattle Club reported a record for butter production which stands as the highest official record of a two-year old heifer which has yet been made. The notable animal is Dolly Bloom, owned by Mr. F. L. Ames of Boston. During the year ending March 25, 1903, she produced 453.86 lbs. of butter-fat which is equivalent to 529.5 lbs. of butter.

In December, 1901, a six-year old Holstein heifer, Mercedes Julip's Pietertje, produced in seven days 23,487 lbs. of butter-fat, which is equivalent to 27 lbs. and 6.4 oz. of butter, when calculated on the same basis as the record of Dolly Bloom. This is the highest official weekly record for butter production today.

In our own Southern California we have some records of which we may be proud. The president of the Southern California Jersey Cattle Club has a beautiful cow. Gold Drop's Maud, which in four years produced 29,596 of milk and 2035.69 lbs. of butter, which is practically an average of 509 lbs. of butter per year.

A beautiful little Jersey, of which any man might be proud, is Rocky's Pogis Pet. She is reported by her owner, Mr. Moore, to have given him a net income profit in three years of $260.

These figures are an inspiration to any one who is engaged in the livestock business. They tell us that there are heights to be reached and rolls of honor to be gained for any one who will put brains and energy into his work of stock raising. It is records like these that brighten the path of daily toil and give us a gleam of hope for our own future in the vocation we have chosen. Moreover, the most beautiful feature of it all is that to bring our own stock to a higher degree of production and proficiency we have only to study and follow closely the laws of nature—than which there can be no more enlightening and en-no-bling occupation.

We look with wonder and astonishment upon the development of our manufacturing industries resulting from new and marvelous inventions. Your entire section of country is today threaded by electric railroads where a few years ago you found yourselves contented with a horse and buggy. Over a wire you talk with your friends in Los Angeles and San Francisco as freely as with your neighbor at your side; and now we are even talking miles through the air—and its not "hot air" either. How are these wonderful and vast things accomplished? Only by a careful application of nature's laws after a thorough study of her ways of working.

As you go about amongst your cattle and sheep and swine and poultry, do you ever think that you are in charge of forces of nature that are as intricate in their details and more complicated in their mechanism than those instruments which help us to communicate with a far-away friend or carry us quickly to that friend? What can be more intricate than the system of nerves and cells and blood vessels by which the cow secretes the milk which gives nourishment to all mankind. How that secretion varies in composition corresponding to influences from within and without and as yet comparatively obscure to the eye of man! It was my good fortune to conduct that most interesting test of Rocky's Pogis Pet at Santa Ana in October, 1902,, at the beginning of which her milk contained 11.4 per cent of fat. As I now recall, the succeeding milking reached something like six per cent of fat. This test is one of the best illustrations of how meagre is our exact knowledge of milk secretion.

It is unfortunately true that little consideration need be given to the intricacy of organic life in our domestic animals when their improvement is not the primal object. To such as are not familiar with the livestock of the country it may seem impossible that any man should keep stock and not be continually looking toward their improvement. But it does not require many days' travel through dairy and range sections to make it very evident that little intelligent thought is spent in this direction. This is why the average yield of butter per head is kept down to 150 lbs. per year. The natural pasturage, wet and dry, a little dry hay, and the cow may give large or small returns as her constitution permits.

But the breeds of livestock of which you and I are so proud were not reared in this fashion. We have no more interesting history in nature's development than that of the Short-horn cattle and how they have been raised from a scrawny, patchy, bony beast to a place amongst the most shapely of our domestic animals. When we read of the first Shorthorns and how Collins and Booth and Bates and Cruickshank and other energetic men labored and studied over them to remove their imperfections, we cannot help admiring these men for their zeal and foresight. We must also admit that they had a remarkable insight into the fundamental laws by which the animal kingdom is improved. The Shorthorn is not yet a perfect animal, but when we compare him with his ancestor of a century and more ago we see an advancement that is as great as it is lasting.

I once saw a picture of a Jersey cow of about 1830 and I wish I might describe her to you. You would not recognize her as the same breed that we are now so proud to call Jerseys. She resembled a zebu in form more than she did her present day descendants. There must have been much careful study upon the part of her admirers, for the first Jersey cattle that were brought to this country thirty years later were imported because of their beautiful fawn-like appearance, which entitled them to a place on rich men's lawns as a household pet. We still find them petable but their usefulness and importance as a producer of wealth far outweigh their once important place as a thing of beauty. Attention to feeding and breeding is making the Jersey a larger and stronger animal, more able to bear her burden of increased productiveness, and only the eye of the far-seeing breeder can foretell what the Jersey of a half a century is to be.

One hundred and twenty-five years ago the county of Ayr in Scotland is said to have possessed a most ungainly breed of cattle, and its unsightly form was not redeemed by any large degree of milk production. The introduction and intermixing of fresh blood from outside and the preservation of consequent favorable results by careful breeding had the usual effect. Today the Ayrshire cattle are a favorite in Canada and some of the Eastern states and a few of them have come to stay in California. There is no animal more comely nor more delightful to look upon than the Ayrshire. There is no cow giving a more nutritious milk though there are some which give larger and richer quantities.

And so I might go on for hours relating the chances in form and usefulness that our present domestic friends have passed through during a few generations of man. The story would not be confined to cattle alone. The horse presents a history that is to many people even more replete with interest and valuable scientific deductions.

Should you follow the development of the sheep, the first name of importance that would meet your eye would be that of Thomas Bakewell, the father of improvement of livestocks in England and the world. It was he who taught us that inbreeding was not only a safe but an essential practice in the origination of new breeds and the formation of useful breeds from seemingly useless native species. Your attention would be held no less by his work in improving the Berkshire pig than with the sheep. The much despised pig affords not the least important instance of what brains and energy can do in moulding the form of animals. Were I to attempt to picture all the transformations that poultry have passed through, there would be such an array of color and feathers that I fear you would refuse to fly to the heights I should point out and even accuse me of claiming too big a victory of man over the fowls of the air. It takes only a few years to make a white fowl out of a black one, and a ringed, streaked and speckled fowl out of a white one.

The end is not yet. When we thus

34-36 Main St., San Francisco. 123 N. Main St., Los Angeles

survey the past and learn what has been done to increase the comeliness and usefulness of the domestic animals we need have no fear that the limit of improvement has been reached. Those of us who are fortunate enough to be close to nature have no doubt as to the future of the breeds of livestock in which we are most interested. And our faith, therefore, goes out to include the whole animal kingdom which man has taken upon himself to improve. A few minutes ago I spoke of the advancement of the Shorthorn as a lasting ont. This is true of any improved breed only as the conditions and environment are perpetuated. I have seen three months of poor feed and care change a fat, round, thorough-bred pig to a thing so like the wild hog that you would swear that it could not have come from well bred stock. What is true of the pig is true of all livestock. Constant care and watchfulness is necessary to keep up the onward march of improvement.

And what is the reward of all this labor and care and thought? The reward is indicated in the records shown you at the beginning. You shall have the pleasure of possessing better animals than your neighbor. Your treasure shall be increased because of the increased usefulness and productiveness of your flocks and herds. You shall stand among the inventors and benefactors of our people because you have done something toward mastering nature's laws and harnessing nature's forces. Who does not envy the place of Luther Burbank in the esteem of man and in his closeness to nature? And above all, by this close communion with nature you shall become a broader and a nobler being.

The dairy side of my subject has given way entirely to the livestock. Yet the same principle runs through one as the other. Everywhere it is nature and her elements working uuder the control of man toward the development of some product. The dairyman who best knows chemistry, physics and bacteriology is sure to make the best butter and cheese. I often wonder which is the more enjoyable, to care for a cow in the way to make her most comfortable and most productive or to stand over a cheese-vat and so control nature's forces at work in the milk as to turn out a cheese that will please the taste and best nourish the body. Both have their pleasures and both require a large amount of thought and study.

I did not come before you to tell you something new—to try to teach you some fresh facts. My mission has been to bring a word of cheer and hopefulness to the man who is spending his physical energy in the dairy and ranch—to lay before him as I have previously tried to do, some of the pleasures and joys of country life; and to show everyone that agriculture is not all drudgery. If the worn out city man wants to get rest let him come back to nature by living with and caring for a few horses, cows, pigs or chickens. I will count my journey to you worth while if I have pointed out to only a few how they may get a larger enjoyment out of life by a deeper study of the ways of nature.

The dairymen in the vicinity of Tulare are preparing to start a creamery.

The creamery at Livermore, owned by a stock company has been closed out and a dividend of 47.93 per cent paid to holders of stock.

A new creamery is being built at Colusa, and machinery will be in place by the middle of August.

While the date for the Jersey exhibit to be held at Los Angeles this fall has not been set, yet we can assure Cultivator readers that the committee in charge are at work and in a very short time their plans will be made public. Get your Jerseys in good condition for tests and exhibition.

The supervisors of Los Angeles county recognize a long felt want and have ordered the construction of a bridge over the San Gabriel river near Azusa.

Chicks and lice cannot thrive at the same time. It is easy to raise a good crop of lice, but if you would have your chicks grow and develop, get rid of the lice; you cannot raise both successfully.

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

SHOULDER CALLOUS.

What would you advise to take a bunch from a horse's shoulder, that has been on for a long time. It is about the size of the yolk of an egg and right on the point of the shoulder. —Subscriber.

Cut it out, and treat the wound anticeptically and allow the horse to lay off until it heals.

* * *

PARTURIENT PARESIS OR MILK FEVER.

One of our Humboldt County subscribers has a cow six years old, that had trouble with her first calf, and had to be aided. Second and third all right. Moderate good condition. Last calf came in afternoon. The cow appeared lame in hind quarters at evening milking time. Was down next morning and could not get up. Appeared to be affected in hind quarters. Gave one ounce alloes, it operated. Eyes bright and normal appearance. Good appetite, and no apparent reason for being down. Cow died 4 p. m., or about twenty-eight hours after droping large calf. What was the trouble? How may I avoid repetition of it?

Don't let your cow get too fat just before calving, and leave a little colostrum in the udder for a couple of days.

* * *

STERILITY.

Pasadena, Cal., July 21, 1903.

Dr. Fenimore—I have an excellent cow that I have been taking to the bull all winter and spring, without getting any satisfaction. Some say I let her go too long but I never had any trouble before. She has been giving milk now over a year, is in good flesh and appears in perfect health. Can anything be done or is the case hopeless? I have taken her to but one bull, as I think he is all right. Please answer through the Cultivator.—O. F. H. Pasadena.

This may be from a number of causes. Common among which is inflamatory troubles of the genital passage at the time of last calving, causing adhesions and obstructions. Fat cows sometimes fail to conceive. In this case give one-half pound of epsom salts a couple of days before she comes in heat and keep on a low diet until after conception.

* * *

WILL BREED.

Editor Cultivator:- A subscriber wishes to know if there is any truth in the statement that twin heifers will not breed.

Twin heifers breed. Twin bulls breed and a twin heifer and bull breed, yet occasionally with them, as with singles, there is one that does not breed.

* * *

SALIVARY CALCULI.

Hollister, July 24th, 1903, Dr. H. D. Fenimore. One of my cows has a lump on the side of her face or jaw. It is about the size of an egg and is about half way between her nose and the heel of the jaw, and moves back and forth when she chews or drinks. It is perfectly hard and smooth, there is no discharge or sign of a sore. She seems well and eats well. has been and is now on dry pasture and I know of no cause for same. Can you tell me what to do to cure or remove the lump? Please answer through Cultivator. Subscriber, Hollister.

Cut it open, take out the contents and dress the wound once a day with an antiseptic.

* * *

QUESTION.

Dr. H. D. Fenimore: I have a cow that has the scours bad. has had it for nearly a year. I have tried different kinds of feed but it did no good. She is just fresh, but gives very little milk. For a long time she has had a swelling under her chin which I think has something to do with the trouble. The swelling seems to be between the skin and flesh. It swells from the throat to the chin. is not sore. When she feeds steady it swells more when she chews her cud, the swelling almost disappears. When she scours more, there seems to be no undigested food pass. She is on good pasture and has a rack of barley hay to feed at, but does not eat much dry food. When she swells most it seems to make her tongue stiff; she is not an old cow. What is the matter with her and what can I do for her? Please answer in Cultivator.—E. A., Westminster.

Your discription sounds like a serious disease. Test with tuberculine for tuberculosis. If she does not respond to that, then look out for haemorrhagic septicaemia.

"Does it cost much to live in the city?" asked the rural youth.

"About the same as it costs to live in the country," replied the village sage, "but it costs like fury to keep up appearances."—Chicago News.

Winkers—Why is it that women always dislike a prominent man who is an old batchelor?

Binkers—Because they can't say that he would never have amounted to anything if it had not been for his wife.—New York Weekly.

THE U. S. EXCELS ON ANY TEMPERATURE

Our "would-be competitors" the DeLaval Separator Co., finding themselves badly beaten in the six weeks' tests of six different makes of Separators at the Kansas Agricultural College, as shown by the official Bulletin No. 123 issued May 26, 1903, in their efforts to break the force of so disastrous a defeat, have compiled a Bulletin of their own "getting up" purporting to be signed by several students, in which they try to make it appear that the DeLaval was not terribly beaten, as the Official Bulletin shows it was, as follows:

Average test of skimmilk of DeLaval Separator	.048
" " " U. S. "	.033
U. S. excels DeLaval	.015

Showing that the DeLaval Separator left 45 per cent. more butter fat in the skimmed milk than the United States.

Again in this "gotten up" Bulletin, our "would-be competitors" state that the U. S. Separator "choked up" on 39 lbs. of milk at 70 degrees of temperature and that the DeLaval ran 80 lbs. Every dairyman using a U. S. Separator knows that the U. S. will not "choke up" on 80 lbs. of good milk at 70 degrees, and that such statements are made in an attempt to break the rapidly gaining popularity of the

U. S. SEPARATOR

We make the following proposition to any dairyman wishing to buy a separator, viz.: We will put a U. S. Separator into his dairy and agree that it will not "choke up" on 80 lbs. or twice 80 lbs. of milk in good condition at 70 degrees, provided he will pay for the separator if it does not "choke up."

The best authorities do not advocate separating at 70 degrees, but if Dairymen prefer to, the U. S. will do it when properly adjusted.

The U. S. Separator skims cleaner than any other separator on the market at any temperature from 70 degrees to 156 degrees at proper adjustment. The Official Bulletin No. 123 of Kansas Agricultural College, dated May 26, 1903, states that

The U. S. Excelled All Others in Tests of Skimmed Milk and in Minimum Total Loss.

Portland, Or. 65 Front Street | San Francisco 9-11 Drumm St.

The foreman of the H. G. Hamilton Dairy is now in the east looking after some new Guernsey blood with which to improve Mr. Hamilton's dairy. He reports that the Guernsey is on a boom at the present time, and that prices are exceedingly high in all parts of the east. Mr. Hamilton thinks the Guernsey has a special value, and adds color and richness to the bulk of his milk.

Fifteen thousand seven hundred dollars is the price paid on a Poland-China hog. Ideal Sunrise, owned in Disco, Indiana. This hog took first prize at the World's Fair in 1893. Fifteen thousand dollars for a ten year old hog seems like hogs are up.

The twenty-first annual sale of Herefords at Chillicothe, Mo., recently aggregated $11,635 for 50 head, an average of $233.

The loss in meat and in live beef to Swift &Co., by the Kansas flood aggregated $200,000.

G. Y. Coutts, of Orange, writes that he has sold his young Jersey heifer, Dottie Dimple 2d, to a Mr. Wheeler, who had before bought stock from him. Mr. Wheeler, before starting in Jersey breeding, was a breeder of fine driving horses.

THE HORN FLY.

A dairyman located in Madera county reports serious trouble with his herd from attacks by what he calls black gnats, which cluster about the head and ears of the stock. The pest is undoubtedly what is more properly known as the horn fly, from its manner of attacking cattle. In some parts of the country they become a serious annoyance to dairymen by causing distress and loss of milk among the herd. Considerable relief may be given by applying grease to parts where the flies are thickest.—D. and P. Riview.

THE FARMER'S AUTOMOBILE.

It is announced that inventive genius is at work on a farm automobile which will do the work of several teams besides makes life a luxury for the driver of the machine. Why should not the application of the motor principle to farm work come? It may take several forms, but any one of them will be beneficial if they are practical. The most feasible idea we have seen suggested is one that combines a motor truck in such a way that it can be used as a wagon or for hauling light wagons or other vehicles behind it, that would also have sufficient power for dragging the harrow or cultivator, also with fly wheel attachment so that the motor can be used for supplying power for running ensilage cutters, pumping water, sawing wood and all the other manifold purposes for which a light power can be so profitably employed on or about the farm. The gasoline engine has already worked wonders in American agriculture, and no series of articles has attracted greater attention or has been more used than those which have graced our columns during the past year on the use of gasoline engines and other farm powers. But the application of these mechanical powers to the farm is just in its infancy, and it will not be long until some bright mind will seize the idea and create a machine which will do the work required. There is a fortune in this for some one.

The farm separator has changed the opportunities of the farmer for making good butter—more of it—and still have a better quality of milk for his calves than he had under the old system. Every farmer can now make good butter that will sell at the top of the market, instead of making poor butter that sold at the bottom of the market.

TWO THOUSAND POUNDS A MINUTE

A. R. Coulson Tells About the New Mixing Machine and Why It Had to Be Built.

The large mixing machine recently completed is something new and it took a long time and lots of expense to make it work. This is the best mixing machine on the Pacific Coast, and it works so well that no doubt that many of the other mills will copy after it.

This electric machine will mix a ton of feed in less than a minute, more evenly and thoroughly than a man with a shovel could mix it in half a day.

Although this great machine cost nearly $1000, it will make a great saving in labor which will make up for the cost of the machine in a few months. Where it cost $1 a ton to mix feed by hand labor this machine will mix it at a cost of 25c a ton.

It was absolutely necessary to have this machine, no matter what it cost, because the trade on balanced rations for poultry and stock was increasing so fast that they could not be made fast enough with six men working by hand labor. Besides, a machine like this one mixes it more thoroughly and satisfactorily than could be accomplished otherwise.

My enterprise is bringing me success. Not only am I successful myself, but those who follow my directions and use my poultry foods are successful too.

This is shown by the ever increasing trade on my balanced rations for poultry.

C. J. McCarthy says he has made more money out of his hens since he has been feeding Coulson's food for laying hens than ever before. He is well satisfied with Coulson's balanced rations for poultry.

D. H. Ward of Cotati has been feeding Coulson's balanced rations for about a year, and has had such splendid success and made his hens pay so well that many of the other poultrymen have gone to him to find out what he feeds to make the hens do so well. Mr. Ward recommends Coulson's balanced ration for poultry.

E. D. Callon of Fallon, who has about 5000 head of poultry, has used a number of tons of Coulson's' poultry foods and recommends it to be all right.

Geo. W. Gaston of Two Rock has 2500 laying hens which are paying him well. Mr. Gaston has fed about 300 sacks of Coulson's balanced rations for poultry and recommends it to be all right.

A. M. Shread, assistant postmaster at Jacksonville, San Joaquin county, writes: After having used Coulson's balanced ration for poultry I wish to say that it is all that it is recommended to be, and that really it is the best food that one can feed, and it is quite a saving on other food stuff, as it is richer and gives better results."

D. F. Colley at Downey, Los Angeles county, when sending for another ton of Coulson's egg food for laying hens, writes: "My hens are doing well now and I think Coulson's food is what makes them lay so, and I do not want to get out of it. The hens like it and it don't take much to fill them up, as it is a richer food. It costs me 50 cents a sack freight so make the price as cheap as possible."

L. J. Howell at Hollister has used over 100 sacks of Coulson's poultry foods and his hens are laying an average of 60 per cent. that is 60 eggs a day for each 100 hens.

Miss K. L. Richardson, an enterprising young lady at Malaga, four miles from Fresno, is making her poultry venture a success. Miss Richardson has ordered over 200 sacks of Coulson's balanced rations for poultry during the last four months.

S. W. Morgan, a breeder of fancy poultry near San Diego, has a supply of Coulson's poultry foods shipped by steamer every three or four weeks.

Many of the fancy breeders in Ventura and Los Angeles county now feed Coulson's balanced rations for poultry.

Mrs. Riley at Biggs, Butte county, orders ten or twelve sacks of Coulson's egg food at a time to be sent by freight.

Many other parties in Placer county, Toulumne county and Yolo county, order a supply to be sent by freight once a month.

Cnopius & Co., Santa Rosa, write: "Please quote us your lowest price on a full carload of Coulson's balanced ration for hens." This firm has already sold over 1000 sacks of Coulson's food.

Extracts from letters:

"We are entirely out of Coulson's egg food and Coulson's chick food and our customers are howling for it. So please see that our order goes forward at once by first freight."

"Enclosed find check for $168.70 to pay for last shipment of Coulson's egg food."

"Please ship at once to Germain Seed Co. by steamer to Los Angeles, 20 bags of Coulson's balanced ration egg food. There is quite a demand for it."

W. T. Park, of West street, one of Petaluma's progressive poultrymen, proved by actual experiment that Coulson's food for hens would make hens lay and grow feathers at the same time.

He bought from a neighbor a flock of 50 hens which were all run down. Their combs were black and they were a hard looking lot. He put them in a pen by themselves and fed them Coulson's egg and feather food and in two weeks they were all growing new feathers and over half of them were laying. Mr. Park uses Coulson's food right along.

There are hundreds of others that are using Coulson's poultry foods right along and are making a success of it.

Coulson's balanced ration for poultry is now on sale at most up-to-date feed stores, or if not, you can order from factory and have it sent by freight.

Zartman & Co. are building a new advertising wagon for Mr. Coulson. It is to cost about $125 and to have a low top and the inside is to be fitted up with shelves and a door on the end so this wagon inside will look like a little store. Charles Mills will have charge of this wagon and will take a four month's trip down in the southern part of the state as far as Mexico. Another wagon similar to this will be built for the northern country.

If you are not using Coulson's balanced ration, why not give it a trial and make more profit out of your poultry. Coulson's food will be as cheap as any other good feed and it will make your poultry give you double the returns on the cost of feed.

Ask your feed dealer for Coulson's food and don't let them sell you something else which they may say is just as good, because they want to sell you something that they can make more money on.

Remember it is Coulson's that you heard so much about, it is Coulson's that gives such good results, and it is Coulson's food that you want.

Following are a few items at random as samples from my daily mail and given here to show what people think of my poultry foods:

Hollister, Cal., July 1, 1903.

A. R. Coulson. Dear Sir: Please ship to me at your earliest convenience one carload, 350 sacks, Coulson's Egg and Feather Food. R. C. GURY.

The Western Union Telegraph Co.

Salinas, July 15, 1903.

A. R. Coulson, Petaluma, Cal.—Ship to W. J. Fair, Salinas, one carload, 350 sacks, Egg and Feather Food and 25 sacks Chick Food.

CHAS. MILES.

L. S. Butler writes from Los Gatos: "I have used half a ton of Coulson's Egg and Feather Food and like it very well. Will soon want more of it."

John Lants of Sacramento writes: "I have used Coulson's and other kinds of egg food, but Coulson's is the best."

Hollister, Cal., July 11, 1903.

To Whom it May Concern:

I, the undersigned, started to feed Coulson's Egg and Feather Food to 250 chickens which were moulting. At the end of ten days I found that my egg production was increased 50 eggs and am fully satisfied with said food.

H. A. Hall.

Hollister, Cal., July 10, 1903.

To whom it may concern:

I, the undersigned, have fed Coulson's Egg and Feather Food to my flock of poultry consisting of 1000 for six months and can cheerfully recommend the feed to any one raising poultry as a cheaper feed and an egg producing feed. Signed, W. K. Goff.

Calistoga, July 11, 1903.

A. R. Coulson—Dear Sir: Enclosed find $7.75 for which please send by freight 5 sacks more of your Egg and Feather Food for moulting hens. So far I am well pleased with results. Yours respectfully,

MRS. E. BANTA.

Santa Rosa, July 13, 1903.

A. R. Coulson—Dear Sir: I write to tell you I have been using your food for about a year and am well pleased with results. I have been keeping hens for over 20 years and never had them do as well as they have since I have used your food. Yours Respectfully, G. J. CUNNINGHAM,

D H. Ward, one of the most successful poultry raisers at Cotati, has been feeding Coulson's Egg and Feather Food for 1 year and has used about 200 sacks of it. He recommends it to all parties raising poultry as it proves to be the most satisfactory and economical of all feeds. Last winter when eggs were bringing 55 cents a dozen Mr. Ward had 500 laying hens that laid an average of nearly 250 egs a day, and were fed on Coulson's Balanced Ration Egg Food.

C. N. Davis says that by feeding his hens Coulson's Egg Food for two weeks the hens have doubled the egg supply and are moulting too.

$500 IN GOLD.

Hollister, Cal., July 9, 1903.

A. R. Coulson—Dear Sir: I send you today $500 in gold by Wells Fargo Express, money collected for Coulson's Egg Food sold at Hollister. Your respectfully, CHAS. S. MILES.

Haywards, July 22, 1903.

A. R. Coulson—Dear Sir: Enclosed find check in payment for last lot of Egg Food. Please ship at once one carload, 350 sacks, Egg and Feather Food; also 1 dozen packages condition powder, 1 dozen cans Coulson's Disinfectant, 1 dozen 50c bottles of Roup Cure.

The Egg Food is selling well here. It gives good satisfaction and we have quite a demand for it. Yours Respectfully,

Kavanagh, Shuey and Gibson.

(By telegraph.) Malaga, Fresno county, July 24, 1903.

A. R. Coulson: Ship to R. Porter, Malaga, 1 car load Egg Food.

This Feed now for sale by over one hundred stores in California. If your dealer doesn't keep it, write for prices and have it sent to you by freight.

A. R. COULSON

772-774 Main St., Petaluma, Cal. Long Distance Telephone, Black 1303

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

HOW A START WAS MADE IN RAISING PIGEONS FOR SQUABS.

One of our new subscribers to the Cultivator has asked for an article on pigeon raising. I would refer him to the description of the largest pigeon ranch in the world, located at Los Angeles, which was given in the Cultivator of May 22nd.

Frances E. Wheeler contributes to the Poultrykeeper the following interesting account of "How a Start Was Made."

Some time ago I promised our readers to give an account and description of my first dove cote. As perhaps I told you before, a party closing out offered me the pigeons and I engaged forty pairs; but when my birds arrived there were just eleven in all; four pair, the rest males! It was claimed that the others had been stolen. Well, the disappointment was swallowed, cheerfulness reigned, as "Despise not the day of small things" came to my mind; and we set about converting a 3x3x3 packing box into this little two-story home, hoisting it onto a post, in the glen. Over both sides we fastened wire netting and placing a short ladder against the post, climbed up and thrust the birds through a small aperture and fed and watered them there for a couple of weeks, when they commenced to build nests.

We then took off the netting ((this was in July) and all summer long and well into winter they were no care whatever, but lived and raised their young in this little house—about twelve pairs in all—feeding on what the ducks left. It was a pretty sight—their graceful ways and flights; but their home proved ill adapted to our severe cold; so, to save their lives, we climbed up again one bitter cold night, caught what we could and housed them in with the ducks.

* * *

Getting Into Bigger Quarters—Then they wintered very comfortably, but we lost quite a few by the change and they did not re-commence to lay until some time in March, by which time they escaped, most of them, from the duck house, and many returned to the glen cote. Finally, in the spring, I decided to shut them up and take proper care of what was left.

Our boundary line fences are built of wire netting, two-inch mesh and five feet high, and at the road and gate angle the netting ran back about twenty-two feet (seven feet high) for the sweet pea hedge. Then we measured off a plat of about 22x16 feet and using nine and a half feet small cedar posts, utilized the sweet pea corner and wire netted the other two sides and top. We used sixteen posts in all for the enclosure, bracing them with trimmings from the saw mill on top, bottom and middle.

For our house we took another packing box and rigged up the inside much like the previous one, only we ranged the boxes on three tiers of shelves inside and gave the pigeons an entrance at each end of the house, and we had a large door for ourselves. It was built very much warmer than our first house. The entire cost of this fresh start was $5 and we had accommodations for thirty pairs of pigeons.

And the Ball Kept Rolling—When we caught our birds and put them in their new home we had ten pairs. There were three pairs of half grown birds and four nests of eggs lost. The parents let the little birds starve. They would not feed them after they had been handled and moved, and so it also proved with the eggs. But after recovering from this last break-up, we sailed along beautifully smooth. In May seven pairs were hatched, and with this encouraging start, the ball kept rolling all summer long.

* * *

A Comparison—In a corner of their yard we sank a tub and kept it filled with fresh water, and under the house on a little table kept their food, grit, salt and oyster shells, and nest material. We fed them corn, buckwheat, oats, barley and red wheat, and whenever a pair of squabs left the nest it was cleaned out thoroughly. As compared with any of our stock—chickens, turkeys or ducks—they require very little attention.

* * *

Working up by Natural Increase—I don't know as I would recommend this way of starting in the squab business for others, and yet for me it had its advantages in being easy and inexpensive and affording an opportunity to study their habits and find out what I could do and what I wanted to do in building up on such a tiny and busy spot as Clovernook.

My plan was to work up the plant by natural increase to about one hundred pairs of pigeons and then sell the surplus sqquabs to the two large summer hotels where the ducks go, and the spot and style of house already described seemed to promise cheapest and easiest methods towards that end. If another change became necessary, we now knew enough to wait until the birds were able to feed themselves and before the parent birds had commenced on another hatch ere removing them from their homes.

But to meet the demand for thoroughbred breeding stock, I purchased two pairs of White Homers from Mr. Arthur Spiller, Beverly, Mass. They were certainly beauties; such style and grace of form and movements as were a delight to contemplate. It seemed as if we could hardly make a house quite good enough for these dainty creatures; but when our effort along this line was complete I felt modestly elated. It was made out of a 5x3 2-3x4 feet packing box. It had four tiers of nests (10x13 inches, with perches attached) on each side, four pairs of nests in each tier, and in the roof six more.

In each end, the width of the center aisle, we placed a large door, and over one a window. The house was double boarded, tar papered and clap-boarded, and every corner made snug and tight for winter with good ventilation for summer. It was large enough inside for food, water and a small oil stove if needed during storms. I had each yard locked, and cared for my birds myself.

* * *

The Market Demand—Really, for genuine enjoyment, pigeons ought to be kept by everybody, if even on so small a scale as I began with the Homers. Having at hand such a table luxury, at short notice, is sufficient excuse for the initiation of a plant like Clovernook's and there is no question but the local trade in squabs can be secured in almost any neighborhood, or nearby hotel or summer resort, at paying prices.

There is always a peculiar satisfaction in working up one's own market for one's own goods, especially when comparatively free from competition, as is now the case regarding squabs, compared to chickens, turkeys, etc. The local field is practically new and the prospects of the small, as well as the large producer, very encouraging.

MATURED

Standard Bred
Barred Plymouth Rocks
Light Brahmas
Buff Orpingtons
S. C. W Leghorns
Only Birds that have
MOULTED
are used as breeders. A limited amount of choice stock for sale. Eggs $2 per 15 January to July.

Some Domestic "Squalls."—Of course there are things to learn, bitter and anxious hours, as in any undertaking. At the time my beautiful pigeons let their little ones starve to death, I had an old Plymouth Rock hen "mothering" two little turkeys. She was lame and she was homely, but her maternal instinct and her patience with those "complaining whistles" was something to admire. She fixed herself in a box to lay, but their crying fussed her so that she finally came out and while they snuggled under her, deposited the egg on the ground.

* * *

Another excitement in the cote was between a white pigeon and her young five months old daughter. The white one made a nest in the roof and hatched a pair of babies and her young daughter cuddled up beside her and laid her first two eggs. For a few days all went well, but suddenly the mother seemed to realize that another set of babies would be very inconvenient on that floor, so she hustled her off the nest and out of the door. Now perhaps that daughter and mother and their respective husbands did not have high jinks for about two weeks over that nesting business! About this time I decided that an old hen was a pretty good investment.

They also developed a great tendency to fight, until I discovered that the rows were made by two lonesome bachelors. When we provided each with a nice little sweetheart they calmed down—became respectable citizens.

Even if, as in matrimony, the glamour soon disappears, and we find our pigeons very like the rest of the poultry world, still, it does not pay to be too critical. A little study, experience and patience smooths away many awkward looking predicaments, until finally we grow to be fonder of them than if they were less interestingly bothersome.

POULTRY NOTES.

See that fresh water is given the fowls at least three times a day, and see that the drinking fountain is kept clean.

Do not duck the hens that are disposed to set during the summer, and do not starve them. Put them in a coop and feed and water them for three or four days.

As fast as the chickens are large enough to market cull them out and sell them. The others will grow faster and be healthier.

A light feed of whole oats at night will be about all the hens need during the summer.

Take good care of the hens so that they will be in condition to molt early.

The chick that receives good care is the one that displays its good breeding.

Laying qualities are now demanding attention and they are not to be despised.

Separate the sexes in both old and young flocks during the balance of the season.

Just as much attention should be paid to size and shape of eggs as the number that the hen lays.

"What whole grains are best to feed to young, growing chickens that have been weaned by the hen and have free range?" Wheat, Indian corn, barley and oats in order named. A change of food is always desirable if convenient, but wheat is a very wholesome and safe food at all times and in any climate; Indian corn is especially good in colder sections where good pasture and forage is prevalent. Barley is a most excellent food, when obtainable, and should be fed more extensively than is customary. Oats when old and good make desirable food, but fowls do not relish them as a rule. Rice is another most excellent food if used in moderation, and acts as a preventive of diarrhoea. The broken rice used by the brewers is worth about four dollars a hundred pounds and answers just as well as the fine article sold at seven to ten cents a pound.—American Fancier.

By having a specialty, you become expert in a certain line of work, thereby producing something cheaper and at the same time of better quality than the fellow who dabbles in everything.

THE CHAMBERED NAUTILUS.

This is the ship of pearl which, poets feign,
Sails the unshadowed main—
The venturous bark that flings
On the sweet summer wind its puurpled wings
In gulfs enchanted, where the Siren sings,
And coral reefs lie bare.
Where the cold sea-maids rise to sun their streaming hair.

Its webs of living gauze no more unfurl;
Wrecked is the ship of pearl!
And every chambered cell,
Where its dim, dreaming life was wont to dwell,
As the frail tenant shaped his growing shell,
Before thee lies revealed—
Its irised ceiling rent, its sunless crypt unsealed!

Year after year beheld the silent toil
That spread his lustrous coil;
Still, as the spiral grew,
He left the past year's dwelling for the new,
Stole with soft step its shining archway through,
Built up its idle door,
Stretched in his last-found home, and knew the old no more.

Thanks for the heavenly message brought by thee,
Child of the wandering sea,
Cast from her lap forlorn!
From thy dead lips a clearer note is born
Than ever Triton blew from wreathed horn!
While on mine ear it rings,
Through the deep caves of thought I hear a voice that sings:

Build thee more stately mansions, O my soul,
As the swift seasons roll!
Leave thy low-vaulted past!
Let each new temple, nobler than the last,
Shut thee from heaven with a dome more vast,
Till thou at length are free,
Leaving thine outgrown shell by life's unresting sea!

—Oliver Wendell Holmes.

AN ARMY LASSIE'S TRIUMPH.

A slender girl came down Santa Barbara's main thoroughfare at night and entered Squibb's saloon. She wore the dark dress, the picturesque hat of the Salvation Army. Before the big bar were a dozen little tables surrounded by the convivial. On a gaudy stage in the corner a woman in pink sang a song, accompanied by a piano, which a haggard-faced man was pounding.

Quibb dispensed liquors over the bar. He was a big man with massive red cheeks and beetling brows, under which keen eyes were forever shifting, forever comprehending all that occurred.

The girl paused a moment at the door, her face like a sweet tone in discord. A something timid in her manner appealed to the crowd, a something trustful and sorrowful in her eyes. Only one brow frowned, that of John Quibb.

She moved among the tables. "War Cry?" she asked.

One man bought. A maudlin fellow called after her in silly jest. The music pounded on, deafening; the woman in pink screeched and ogled, and John Quibb's eye comprehended everything. Through a rear door men continually went, and the girl coming there looked into a dark passage. Quibb's eye was scorching her. Turning, she saw his stiff, short hair, his red cheeks, his beetling brows. She grew paler; then walked through the rear door.

She came to a tiny room far back, whose ceiling was low and dirty, whose wall was hung with one old print of Rosa Bonheur's "Horse Fair." Over a battered green table hung a fly-specked incandescent light, and round the dice, filling the room, crowded with gamblers.

"War Cry?" she said, flitting in.

Only the man who shook the dice box seemed to hear. He was a young fellow, Harry Quibb, and he flinched. His voice, as he called out the indications of the dice, was halting. He was handsome, carelessly dressed; a lock of hair falling over his forehead; a fast look on his lips; eyes brown and lovable. Now, as the money went jingling over the cloth and all the players jostled 'round, he heard her voice again, and would not look up. She passed very near him, and her arm touched his, at which she grew pink, looked frightened and turned away quickly. His eyes suddenly flung up, found her looking back, and they gazed at each other. Then young Quibb said: "I'll take one."

She handed the paper to him, and he ashamed, tossed out the dice fiercely while she half ran away. The little room was strange tonight; the little low door was thenceforth a portal to her thoughts.

Yet another night she came. Glasses were foaming; a woman in blue sang; and the piano well-nigh split the ear. When she took in the door—a gentle slim thing—John Quibb's eyes flashed around at her. She went quickly toward the little back room, but stood a long time in the passage, fighting it out. She wanted to enter so badly that she feared she ought not. Yet that was her duty. Quivering, she glided in, where a voice, calling out the indications of the dice, was heard.

"'War Cry?'" she said, faltering, looking down.

Now she moved toward Harry Quibb, who thrust forth his arm, as he took the box, in such a manner that she must graze it. Beholding that, she shrank; but the room was tiny; she shut her eyes and sprang by him—and she touched him with her sleeve.

Now, the game was gone from him; now he forgot; and of a sudden they looked at each other. Quick shame came newly born to his cheeks; the dice, live before, died in his hand; for there was pity on her face. She looked frail, like a flower on the slender stem. When she turned and disappeared that was like robbery to him, or the unexpected breakage of a fragile treasure.

"Gentlemen," he said, bewildered at himself, getting up, "the game will have to wait a minute."

A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.
SOUTHERN PACIFIC
261 SOUTH SPRING ST.

The dice were dropped; the jostling, eager-eyed men crowded in more thickly, waiting, seeing him stride out the little door.

She was flitting yonder through the passage toward the lights of the saloon.

"Wait a minute," he called huskily. She turned in trepidation. "You're too good to be here," he said, blundering, standing a little way off in the gloom.

"Why, no," she answered, "this is the kind of place we hunt for."

"We're not worth it," he next said, convinced and bitter.

She looked up straighter. He never saw a face like hers before. "You're worth my whole life," she said, "if it would do any good.

He was drinking her eyes with parched thirst of his heart. Then he said abruptly: "You're the only thing that could."

Yonder the woman on the stage was singing—the cracked notes of her unpleasing song floated here a little softened. The babel of the saloon came here too on fume-laden drafts of air. He went back again, fast, to his dice. When she emerged in the saloon she met the unendurable eyes of the elder Quibb, which, having pried into the darkness of the passage, seemed now to express rage. Yet all the convivial ones gazed on her with welcome. In his debauchery, man likes to think that he is tender.

Coming out of Quibb's place one other midnight she was like some plaything of the wind, blown along the street from the sea. She was lonely, dreaming, not wanting ever to sleep any more. The saloons and houses became dark, but there was a half-moon. She came to the steps of the Methodist church, and Harry Quibb sat there waiting.

"Don't run away," he pleaded; and her religion, to help the sinful, brought her back.

"What do you do it for?" he said, a little angry as with suffering; "just because they tell you to—or because you want to?"

Tears well d up in her eyes. "If that," she said, wounded, "is all you think of, it"—

"I didn't mean that," cried he; "I know you're good down to the bottom of your heart."

"What else can I say to you," she asked, unsteadily, "to help you. Do you want to stop the dice?"

"I want to stop my whole low-down life; that's what I want," said he; "I want to die."

"I'd help you to stop the dice," she said, too trembling to more than whisper; "I'd do anything; I'd try to show you the way."

He seized her hand and held her; and she sank down on the step of the church. "But, would you love me?" he cried.

All she could say after some time of silence was: "That isn't fair. Oh, you know that isn't fair.

He held her fingers a long while and then she arose and walked on. "No," he said, putting his hand to his head, "that wasn't fair."

The elder Quibb, having slept till 10 o'clock in the morning, came rolling into his place of business at 11, hazy-eyed and brutal. There was but one customer; and yonder by the farthest frosted glass window, staring blankly through the pane through which he could not see, was Quibb's son. The saloonkeeper grunted.

Half an hour having passed, the youth came and leaned over the bar. "Father," he said, "come into the back room."

Already angry, Quibb followed. In the empty hole of the dice, where the prancing horses at the fair looked dingy on the dingier wall, they faced each other, Quibb's eyes eating into the countenance of his son. With desperate determination, the youth said: "I'm going to quit."

Quibb ripped out an oath. What'll you do, you fool?"

"I'll leave Santa Barbara and go to Riverside," said his son. "John Watts offered me a job on his orange ranch."

The saloonkeeper's hand fell on Harry Quibb's shoulder. "No you won't," roared he, like a bull; "you think I don't know what's the matter; its that infernal girl. Half the profits come from this game. Say, if you quit, who would know how to handle the bones like I taught you?"

His anger was now reflected in his son, who cried defiantly, "the game's too dirty for Harry Quibb!"

At this Quibb's eyes came close to the boy, and Quibb's breath blew hot over his face. "So that's your graft. You fool! Now listen. That girl has put this notion in your head. If you don't cut her short off and stick to this business like a man," Quibb raised his fist, "I'll kick her out of this saloon!"

(Continued next week.)

HOW TO GROW.

The father of Alice and Jessie found them one day studying with their heads bent low over their books. They said they were very tired.

"Let me see you walk up and down the veranda," he said.

The little girls wondered what papa meant, and walked slowly past him across the veranda.

"You are not growing right," he said. "I cannot tie you up to a stake, as I did my peach trees, but I must do something. Come out here on the veranda tomorrow morning at 8 o'clock, and tomorrow night at six, and let us see what we can do."

When Alice and Jessie went out on the veranda before school the next morning, they found their father there in the big hickory chair. There were four tin pails standing near him, and he held two books in his hand.

"I want you to fill these pails at the out-door faucet, put these books on your head, and, with a full pail of water in each hand, walk up and down the long path for half an hour without spilling the water or letting the books fall."

The girls laughed, and said that would be fun. They spilled the water very often at first, but they soon learned to walk in the right way, and tiwce a day went through the half-hour walk while their father watched them. They grew to be young ladies who walked like queens.—Selected.

RECIPES.

Chilled Pineapples—Remove the rind and carefully cut out all the eyes, hold the fruit on a fork run into one end, and with another fork pick off all the tender part in as small portions as possible, mere shreds. Sweeten to taste with powdered sugar. Remove the beaters from the freezer can, put in sweetened fruit, surround the can with ice and salt, and let it stand about an hour.

Rice Snowballs—Boil six ounces of rice in one quart of milk with sugar and flavoring to taste. Add more milk if it is needed in the boiling, and when the rice is tender put it into teacups or round moulds to cool. When ready to serve pour out the rice balls, arrange them in a deep glass dish, pour over them one pint of custard, and on the top of each place a small piece of jelly or bright-colored preserved fruit.

Stewed Apples and Custard—Pare and remove the cores from seven good-sized apples, but leave them whole and with the stems if you choose. Boil one-half pound of sugar in three-fourths pint of water for ten minutes, then put in the apples with the rind of half a lemon, and simmer gently until they are tender, but not broken. Dish the apples and reduce the syrup by boiling it quickly for a few minutes, cool a little, and pour it over the fruit. Have ready a half-pint of custard and pour it round the apples when they are quite cool.

Spanish Cream—Dissolve one-half box of gelatine in a little warm water. Beat the yolks of three eggs with two-thirds of cupful of sugar, add it to one and one-half pints of milk, place in a double boiler and cook for a few minutes before putting in the gelatine. Remove from the fire and stir in the beaten whites of four eggs, put into a mould and serve cold with whipped or plain cream.

Blanc Mange—Put into a double boiler one quart of sweet milk and let it reach the boiling point. Beat together four eggs, four tablespoonfuls of corn starch or farina, and one-fourth cupful of milk, and add to the boiling milk. Cook for a few minutes and pour into moulds in cold water. When firm turn out and serve with cream and sugar and a spoonful of preserved ginger, with the syrup, at one side of the dish.

Circumstances: The man of genius creates them, the man of talent uses them, the fool looks at them without seeing them.

HOMELY HINTS.

Salt on the fingers when cleaning fowls, meat or fish, will prevent slipping.

Salt thrown on a coal fire, when broiling steak, will prevent blazing from the dripping fat.

Salt as a gargle will cure soreness of the throat.

Salt in a solution inhaled cures cold in the head.

Salt in the water is the best thing to clean willow ware and matting.

Salt in the oven under baking tins will prevent their scorching on the bottom.

Salt puts out a fire in the chimney.

Salt and vinegar will remove stains from discolored teacups.

Salt and soda are excellent for bee stings and spider bites.

Salt thrown on soot which has fallen on the carpet will prevent stain.

Salt put on ink freshly spilled on the carpet will help in removing the spot.

Salt in whitewash makes it stick.

Salt thrown on a coal fire which is burning low will revive it.

WITH THOSE WHO SUFFER.

We all need personal contact with those who suffer. "The most certain softener of a man's moral skin," writes Dr. Arnold of Rugby, "and sweetener of his blood are, I am sure, domestic intercourse in a happy marriage and intercourse with the poor." Gladstone never appeared nobler than when he read the Bible to an old street sweeper in an attic.—Ex.

NOT IN CALIFORNIA.

The crop is poor,
Can we endure
Our sorry lot?
The fruit is small,
There's none at al.
To put on top.
—J. A. Staples in N. Y. Sun.

He (rather shy)—Won't you—er—give me a token of—er—re—membrance?

She—Do you want something that will always remind you of me?

He—Yes.

She—Well, that being the case, what's the matter with myself?

Moral: If the animal refuses to jump, let down the bars.—Chicago News.

If all the sunshine was poured on us we should be blinded and burned. But we can see it on every little spar of grass and in th water-sparkles and on the hills and the white clouds. That is the way we get it all.—Mrs. A. D. T. Whitney.

Trousers

Appropriate at all seasons of the year is a little talk on trousers. Beginning with our special leader at $2.35—really worth $3.00—a trouser for men who have heavy work, and then our special $3.00 corduroys which are easily worth a dollar more, they run along in easy price-steps up to the fine dress trousers at $5.00, $7.50 and $10. In style, fit and comfort they're unsurpassed.

DOWN BY THE SEA!

A day spent on the warm sands at the seashore imparts to the mind, as well as the body, new life, new hope, and to the city weary a day of peaceful rest and quiet. The most delightful and only clean, sandy beaches are those of Long Beach and Terminal Island. Here you can lie in the warm, soothing sands and dream the hours away, or you can dig clams, gather beautiful shells and sea mosses and have a good time playing in the surf of the sea as it rolls shoreward. Agents of the

Los Angeles Markets.

Los Angeles, July 30.

Ranch eggs are scarce and market firm.

Eastern butter very plentiful, but market not affected in local brands. Prices remain firm.

Potatoes are a light crop and will be in good demand. Sweet potatoes now coming in.

Poultry scarce, same prices prevailing as last week.

The watermelon crop will be lighter than last year, though the acreage is larger. Prices are better and promise to hold during the season.

San Francisco Markets.

Dairy.

San Francisco, July 30.

The large shipments of butter to this city, together with heavy stocks of cold storage has told upon the price. Buyers are cautious and the sellers are trying to hold the price to the old basis, but the best they could do was to keep it from falling off more than a cent. Unless the heavy receipts slacken up further, heavy cuts will be made.

Eggs and Poultry.

There was little change in the market for Eggs; fine ranch offerings were firmly held at full figures and close clearances were easily effected. Storage lots are selling in the neighborhood of 25c and are being freely utilized.

EGGS—Per doz.:

Ranch, selected, large	.27	@27½
Ranch, good to choice	.25	@26
Store	.20	@23

POULTRY—Old Roosters, per doz., $4.50@5; young Roosters, $6@8; Fryers, $3.50@4.50; Broilers, large, $3@3.50; small, $2@2.50; Hens, $4@5; Ducks, per doz., old, $3@3.50; young, $3.50@4.50; Turkeys, nominal; Geese, per pair, $1.25@1.50; Goslings, $1.25@1.50; Pigeons, per doz., young, $1.50; do, old, $1.50.

Fruits and Vegetables.

There has been a good demand for the better varieties of Deciduous Fruits and while the general market seemed in better shape, the liberal offerings of inferior quality stock prevented any material improvement in prices. Receipts of Peaches showed a marked shrinkage and enabled sellers to dispose of a large portion of carried-over stock. Fancy lots of the fresh receipts sold off quickly, well up to the top quotation and in a few instances exceded it for extra quality lots. In Pears there was a fair movement in No. 1 lots of Bartletts in bulk at quotations. Large stock of good shape sold freely at the maximum rate, but irregular shaped Fruit and poor quality lots dragged down to the bottom rate. Other Pears met with a moderate jobbing sale at familiar prices. Canners took bulk lots of Plums freely, readily paying the $20 rate for fancy green varieties. Packed descriptions of both Plums and Prunes were not particularly favored and the comparatively light holdings fully balanced requirements. There was an oversupply of Apples and the market was weakened, prices receding rather sharply for all grades. Fontainbleau Grapes dragged slowly at the old rates, but the limited offerings of Seedleess were well cared for at full figures. Some Seedless Sultanas from Hanford in large crates sold as high as $1.75. Figs were fairly steady at quotations. Crab Apples and Nectarines dragged at unaltered rates. The cool weather hampered the demand for Melons and the markt for all descriptions ruled easier, with lower prices prevailing. Quite a few small Watermelons were at hand, which dragged slowly at the minimum rate. Prices for Berries are unchanged and supplies of desirable quality lots were well cleaned up at full figures. The receipts of Logan Berries are plainly evincing the progress of the season, as are those of Longworth Strawberries, and it is difficult to obtain the top rates for even the best of them. In Citrus Fruits conditions were about as previously quoted and values for Tropical offerings were without variance.

DECIDUOUS FRUITS.—Apples—Per box, common to choice, 40@85c; fancy, $1@1.25; Crab Apples, per box, 30@60c.

PEACHES—Per box, 30@50c; basket, 30@50c; bulk, per ton, Freestones, $20@25.

PEARS—Per box, No. 1 Bartlett, 85c@$1; common, 40@75c; bulk, per ton, $25@35; other varieties, 25@50c; basket, 25@40c.

PLUMS—Per box or crate, 25@60c; basket, 15@40c; bulk, per ton, $15@20; according to variety.

PRUNES—Per box or crate, 35@60c, as to variety.

FIGS—Per box, 40c@$1.

APRICOTS—Per box, 40@50c; bulk, per ton, $20@30.

CANTALOUPES—Per crate, $1@2.50.

WATERMELONS—Per 100: $3@20.

NUTMEG MELONS—Per box, 50c@$1.25.

GRAPES—Per box or crate: Seedless, $1@$1.25; Blacks, —; Fontainbleau, 50c@$1.

NECTARINES—Per box or crate: Red, 50@75c; White, 40@65c.

BERRIES—Per chest: Strawberries—Longworth, $5@7; large varieties, $3@5; Blackberries, $2.50@4; Raspberries, $4@7; Logan Berries, $3.50@5; Huckleberries, per lb, 10c; Currants, per chest, $4@5.50.

TROPICAL FRUITS—Bananas, per bunch, Hawaiian, 75c@$1.50; Bluefields, $1@2.50; Pineapples, per doz, $1@2; Dates, Fard, per lb, 7@9c; do, Persian, 6@6½.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, $1.75@3, as to quality; Valencias, $2@3; St. Michaels, $2@3; Seedlings, and Mediterranean Sweets, $1@1.50; Lemons, $1@$3; Grape Fruit, $1@2; Limes, $4@5.

Increased receipts and some accumulation caused further depreciation in values for Tomatoes yesterday and the market ruled topheavy at the decline. Green Peppers were also easier, supplies being more liberal. There was an abundance of Egg Plants, Summer Squash and Cucumbers on, and all these commodities are freely offered. All descriptions of Beans are in good request and sell off readily well up to the top figures. Good corn is scarce and readily brings top rates. Other Summer Vegetables are plentiful and prices lean toward easiness. There is a good lively demand for the beter quality Potatoes and the market rules steady at maintained prices, with available stocks fully up to trade requirements. Onions are as previously quoted and in fair request.

VEGETABLES—Asparagus, per box, $1@$2.50; Tomatoes, per box, small, 25@35c; do, river, large box, 60@85c; Green Peppers, per box, Bell, 75c@$1.25; Chile, 50@75c; Dried Peppers, 6c; String Beans, per lb., 2@3c; Wax, 4@5c; Lima Beans, 6@7c; Green Peas, per lb, 3@4c; Egg Plant, per box, 75c@$1.25; Summer Squash, per box, 25@50c; Cucumbers, per box, 25@50c; Garlic, per lb, 2@3c; Green Corn, per sack, $1.25@1.75; crate $1.25@2; Okra, per box, 65@75c.

ONIONS—New Silver Skins, per ctl., 60@70c.

POTATOES—New Whites, per box, $1.25@$1.75; per sack, 90c@1.50; Early Rose, per ctl., 75c@$1; Garnet Chile, per ctl., $1@1.15; old Potatoes, nominal.

Dried Fruits, Nuts, Etc.

Little interest is shown in Dried Fruits and the business in progress is confined mostly to job-lot transactions. In new Fruits buyers are still indifferent and local brokers are reporting an easier tone to the markets for both Apricots and Prunes, although they are not quoting out any lower prices. Both comb and extracted Honey are now arriving in liberal quantities and prices are less firm and are quoted at a slight decline.

DRIED FRUITS—Prices for carload lots f. o. b. at California common shipping points, in bags, for 1902 crop, are, per lb., as follows:

Apples—Evaporated, 4@6½c; Sun Dried, 3@4c.

Apricots—Royal, choice to fancy, new, 6¾@8c; old, 6½@7c; Moorparks, choice, nominal.

Peaches—4¼@6½c.

Pears—4¾@9½c.

Plums—Pitted, 4½@6c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 2¼@2½c, with ½@1c premium for large sizes; new crop, 2¾@3c.

Nectarines—Whites, 4@5½c.

Figs—White, 5½@6c; Black, 5c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1902 crop: Loose Muscatels, 50-lb boxes, per lb., 2-crown, 5½c; 3-crown, 5¾c; 4-crown, 6c; Seedless, loose Muscatels, 5c; London Layers, 20-lb boxes, per box, 2-crown, $1.40; 3-crown, $1.50; fancy clusters, 4-crown, $2; Dehesa, 5-crown, $2.50; Imperials, 6-crown, $3. These prices are subject to change without notice. Seeded, f. o. b. at Fresno, per lb.: Fancy, 16 7¾c; 12 oz., 6¼c; bulk, 7½c; choice, 16 oz., 7½c; 12 oz., 6c; bulk, 7¼c.

NUTS.—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Pecans, 11@12c; Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c; Chestnuts, Italian, nominal.

HONEY—New Comb, per lb., White, 14½@15c; Light Amber, 13½c; Extracted Water White, 6½c; Light Amber, 6c; Dark Amber, nominal.

BEESWAX—Per lb., 32c.

Live Stock.

There has been no change in the live stock market other than hogs are slightly off. There are liberal stocks on hand and the market is lively.

Quotations are:

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 7@7½c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@8½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES.—Light, per lb., 5@5½c, gross weight; heavy, 4½@4¾c, gross weight.

SHEEP—Per lb.: Fat Wethers, No. 1, 4@4¼c, gross weight; Ewes, No. 1, 3¾@4c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb. live weight.

HOGS—Per lb.: Hard grain fed, weighing alive 140 lbs and over, 6@6¼c; weighing under 130 lbs, 5¾@6c; weighing 260 to 350 lbs, 5½@6c; rough heavy, 4½@5c.

Hay and Feed Stuffs.

HAY—Prices on new Hay, per ton: Wheat, $11@14; Wheat and Oat, $10.50@12.50; Oat, $8.50@12.50; Barley, $8.50@11; Clover, $8@10; Alfalfa, $9@10.50; Stock, $8@9.

falfa, $9@10.50; Stock, $8@9.

STRAW—Good to choice, per bale, 45@60c.

FEED CORN MEAL—Choice grades, per ton, $32.50@33.50.

GROUND BARLEY—Per ton, $22.50@23.50.

MIDDLINGS—Per ton, $27@30.

BRAN—Per ton, $24.50@25.50.

RICE MEAL—Mill price, $18 per ton.

CRACKED CORN—Choice quality, per ton, $33@34.

COCOANUT CAKE—Best quality: In lots of 10 tons and upward, $20 per ton; 5 tons, $20.50; small quantities, $21.

BEANS—Prices per ctl.: Large Whites, $3@3.15; small do, $3.15@3.30; Pea, $3.25@3.50; Lima, $3.45@3.60; Red, $2.90@3; Pink, $3@3.10; Bayo, $3.65@3.75; Blackeyes, $2.75@3; Red Kidneys, nominal.

Cereals.

WHEAT—New crop: No. 1 shipping, per ctl. $1.41¼@1.42½; choice, $1.43@1.45; White Milling, good to choice, $1.50@1.60.

BARLEY—New crop: Choice, No. 1 Feed, $1.05@1.08¾; Shipping, $1.12½@1.20; Brewing, No. 1, $1.16¼@1.22½; Chevalier, nominal.

OATS—Feed, good to choice White, $1.22½@$1.32½; White Milling, $1.32½@1.37; Red, $1.15@1.27½; Black, $1.12½@1.20.

RYE—Good to choice, per ctl., $1.10@1.15.

CORN—Good to choice, per ctl.: California, new large Yellow, $1.50@1.55; small do, $1.70@$1.75; White, $1.50@1.55.

Hops.

The prices for new crop are 18 @20c per lb, according to quality.

Eastern Markets.

New York General Market.

CHICAGO, July 29.—Improved weather and the heavy selling of yesterday caused weakness in wheat at the start today, and the early depression was considerably augmented by the severe break in corn prices. September opened with a loss of ¼ to ⅜ to ⅝ at 77½@77¼@77⅛; and there was very little wanted at the decline. Prices held fairly steady during the first hour at the lower range, but later a better demand developed, induced by bullish news from the Northwest, where reports from Manitoba showed greatly reduced crops in that section. On the advance, offerings became extremely scarce, but were well maintained throughout the remainder of the ses-

sion. General rain throughout Iowa, Illinois and Nebraska caused heavy selling in corn at the opening, and extreme weakness prevailed, September falling ⅛ to ¾ at 51¼@54¾. At one time the offerings were overwhelming and the market was badly demoralized, but later a good demand developed on reports from sections of the corn belt to the effect that only light showers had fallen and that much more rain was needed. After selling between 51⅝ and 52¾, September closed ½ higher, at 52¾. Oats acted largely in sympathy with corn, opening weak, but showing a good rally later with local longs who had sold out their lines, replacing them on the break. The close was firm, with September ¼ higher, at 33¾.

Cash quotations were as follows. Flour was steady; No. 2 spring wheat, 80@81; No. 3, 78@79; No. 2 red, 77@78⅞; No. 2 corn, 53; No. 2 yellow, 53; No. 2 oats, 42½; No. 2 white, 38@39½; No. 3 white, 34@35½; No. 2 rye, 51; good feeding barley, 32@40; fair to choice malting, 47@53; No. 1 flax seed, 93; No. 1 northwestern, 97; prime timothy seed, 3.40; mess pork, per bbl., 13.65@13.70; lard, per 100 lbs., 7.85@7.87½; short ribs, sides (loose), 7.75@7.87½; dry salted shoulders (boxed), 7.50@7.62½; short clear sides (boxed), 8.25@8.37½; clover, contract grade, 12.00@12.50.

Grain Movements.

Articles—	Receipts.	Shipments.

Barley, "	44,000	7,300

On the Produce Exchange today the butter market was weak; creamery, 14@18½; dairy, 12½@17; eggs, easy at mark, cases included, 11@12; cheese, steady, 10½@11.

Chicago Live Stock.

CHICAGO, July 29.—Cattle—Receipts, 23,-000, including 2000 Texans; market steady to 10c lower; good to prime steers, 5.10@5.50; poor to medium, 3.90@4.50; stockers and feeders, 2.50@4.30; cows, 1.50@4.50; heifers, 2.50@4.70; canners, 1.50@2.75; bulls, 2.25@4.40; calves, 3.00@6.75; Texas fed steers, 3.25@4.50. Hogs—Receipts, today, 23,000; tomorrow, 25,-000; left over, 3700; 5@10c higher; mixed and butchers, 5.20@5.70; good to choice heavy, 5.40@5.55; rough heavy, 4.75@5.35; light, 5.30@5.80; bulk of sales, 5.35@5.55. Sheep—Receipts, 18,000; sheep and lambs steady; good to choice wethers, 3.75@4.00; fair to choice mixed, $3.00@3.50; western sheep, $3.00@4.00; native lambs, $3.25@6.25; western lambs, 5.00@6.25.

California Dried Fruits.

NEW YORK, July 29.—The market for evaporated apples is quiet. Common, 5½; prime, 5¾@6; choice, 6¼@6½; fancy, 6¾@7½. Prunes remain steady at from 3@7 for all grades. Apricots steady; choice, 8@9; fancy, 10@12. Peaches, quiet; choice, 7@7½; fancy, 10@12½.

MARKET NOTES.

Apricot drying is about finished. The market for the dried fruit is very slow. Only about 4c per lb. is offered for old and 6c for new crop. In the northern end of the state about 7c is the ruling price.

Peaches are very dull, and the crop will be short. From 4 to 6c for dried fruit is the ruling price. Canners are paying from $10 to $15 per ton for freesetones and as high as $25 for clings.

Walnuts are still dropping from the trees. Less than half crop will be harvested. The price will not be set till September, when the associations meet. The European crop is reported less than full yield.

Alfalfa hay is scarce and some higher than last year at this time.

The Chicago Packer has established a laboratory under the direction of Prof. Carlisle, who is now making tests on citrus fruit juices, with the especial intent of finding some way to keep orange juice. Once the problem is solved of keeping orange juice fresh and pure and clarified so as to make an attractive article orange growers will have a commercial outlet which will go far to reduce their troubles to a minimum. Californians will realize what it means to that state. A large eastern concern has a standing offer to contract all the high class orange juice offered if it can be brought up to the standard desired.

The indications are for a heavy yield of Lima beans. In Santa Barbara and Ventura counties the acreage is nearly 43,000, in the Santa Monica district about 10,000, and in Orange county there is an acreage of about 6,000 planted.

The crop of honey from the state is now estimated to be not over 150 carloads.

Taken as a whole the eastern fruit crop is way under the average yield. One hundred carloads of fruit a day, or 2,400,000 pounds, are now going East from Sacramento. Up to last Monday the number of cars sent East to all points beyond Ogden was 1717. They contained 41,208,000 pounds of Fruit. Both the railroad officials and the orchardists say that the prospects are favorable for the shipment East this season of 192,000,000 pounds of all sorts of green fruits. This is equivalent to 8,000 carloads.

The Hemet Deciduous Fruit Association has sold its season's crop of dried apricots to Armsby & Co., at a price reported to be 7¼ to 7½ cents. This year was a good one for Hemet growers, the output being 75 tons of the best dried cots yet offered.

CITRUS MARKETS

ORANGE MARKET.

The past week has shown very satisfactory prices for oranges, in anything like good condition, in all sections of the country. Arrivals have not been heavy and a fair demand has kept all markets fairly well cleaned up. Auctions have shown high prices on extra fancy Valencias and Mikes and very fair prices on extra choice stock.

The condition of seeds and sweets generally has been poor and while a few cars of extra good stock have brought good prices in auctions, results have usually been ordinary.

On the other hand, western markets have been very good for anything desirable in these varieties, while demand for Valencias has been limited on account of the higher prices. Shipments last week averaged 38 cars of oranges per day, very heavy for this time of year. It looks as though seedlings and sweets were going to continue to go all summer. The prospects are for ample supplies and a possible weakening of the market, as all kinds of fruit will be plentiful and cheap.

* * *

LEMONS.

These have met with a very serious decline in the market and prospects point to a continuance of a lower range of prices, unless the weather man gives the eastern people another hot wave of sufficient duration to turn their attention to lemonade. The supplies en route are quite heavy, many of which will have to go to further eastern markets as the west will not consume them all, under present conditions. Shipments from California however, will be much lighter for some time to come and when the heavy supply en route is cleaned up the prospects are that the moderate supply will no more than fill western demands.

* * *

SHIPMENTS.

The total shipments of citrus fruits this season from November 1st, to date, are 21,022 carloads, of which numbe· 2349 cars were lemons.

AUCTION SALES.

CLEVELAND, JULY 24.

Market weak on account of other varieties of fruit.

Q. C. Fr. Ex., Leader navels, $1.55; Monogram, $1.15, 25 per cent decay; Leader sweets, $1.45; Monogram, $1.00, 20 per cent decay.

C. C. U., Corona, Excelsior sweets, $1.35; Nasturtium sweets, $1, 20 per cent decay; Excelsior lemons, 5 per cent decay, $2.45.

S. S. Ex., S. S. choice lemons, $2.80; S. S. S. standard lemons, $2.55, 10 per cent decay.

C. C. U., Riverside, Turquoise seeds, 10 per cent decay, $1.40.

BOSTON, JULY 24.

Market advancing.

C. C. U., East Highland, Grape Fruit, seedless, $2.25; common, $1.90.

Riverside Fr. Ex., Red Mountain seeds, 5 per cent decay, $1.90; Red Mountain Mikes, $2.65.

C. C. U., Rialto, Margaret Mikes, $2.75; Angel sweets, $2.70; Excelsior sweets, $2.20; Margurite seeds, $2, 5 per cent decay entire car.

PITTSBURG, JULY 24.

Market is steady.

Riverside Ex., Our Pride Valencias, $3.35; Eagle, $3; Eagle sweets, $2.10, 5 per cent decay.

C. C. U., San Morino, Titus Ranch seeds, 12 per cent decay, $1.90.

S. S. Fr. Ex., S. S. choice navels, $1.15; S. S. choice sweets, $1.35, 3 per cent decay.

CINCINNATI, JULY 24.

Market steady and weather hot.

S. S. Fr. Ex., S. S. S. standard navels, $1.25; S. S. choice sweets, $1.30; S. S. S'standard sweets, $1.20, 35 per cent decay.

CLEVELAND, JULY 27.

S. T. Fr. Ex., Echo Valencias, $2.90; Arroyo Valencias, $2.15, 3 per cent decay.

A. H. Fr. Co., Lemonade lemons, 10 per cent decay, $2.

C. C. U., Riverside, Turquoise seeds, 15 per cent decay, $1.35.

PITTSBURG, JULY 27.

Market is steady.

O. K. Ex., Bear Valencias, $3.75; Quail, $3.15; Owl, $2.80; Blossom lemons, $2.40, 5 per cent decay.

C. C. U., East Highland, Camellia Valencias, $3.60; Blossom, $2.65; 7 per cent decay.

O. K. Fr. Ex., Lemon Blossom lemons, 12 per cent decay, $1.95.

NEW YORK, JULY 27.

Riverside Fr. Ex., La Mesa Valencias, $3.25; Golden Rule, $2.85; Golden, $2.25, 5 per cent decay; Golden Rule lemons, 12 per cent decay, $2.15.

A. C. G., Azusa, Blue Seal Valencias, $5.30; Red Shield Valencias, $3.50; Green Crown, $2.35.

BOSTON, JULY 28.

Riverside Fr. Ex., Red Globe Mikes, $3.15; Standard, $2.85; Red Globe sweets, $1.75, 20 per cent decay; Our Pride Mikes, $4.25; Eagle, $3.60, 10 per cent decay.

NEW YORK, JULY 29.

Arlington Hts., Artesia Valencias, $4.80; Squirrel, $3.75.

C. C. U., Redlands Junction, Monogram sweets, $2.45; Blossom, $2.35, 7 per cent decay; La Belle Valencias, $2.20, 10 per cent decay; Le Belle sweets, $3.05, 5 per cent decay.

Tulare Co., orchard run Valencias, 3.30; C. C. U., Riverside, Daisy Vanlencias, $3.10. Tropical Queen, $2.75, 3 per cent decay.

BOSTON, JULY 29.

Market steady.

Indian Hill Mikes, $3.75; Volunteer, $3.35; Foothill, $3.25.

C. C. U., Lindsay, Missletoe Valencias, $3.10.

PITTSBURG, JULY 29.

Market steady.

Tulare Co. Ex., State Valencias, $3.25; Capitol, $3.05.

Ventura Co. Fr. Ex., Cupid Valencias, $3.55; Cycle, $2.90.

O. K. Fr. Ex., Special Quail lemons, 5 per cent decay, $2.50.

CLEVELAND, JULY 29.

A. H. Fr. Co., Palm Tree Valencias, 35 per cent decay, $2.75; Palm Tree lemons, 10 per cent decay, $1.85.

S. S. Fr. Ex., S. S. choice lemons, 7 per cent decay, $2.75; S. S. S. standard lemons, 12 per cent decay, $2.

Shipments, total for season, 21,022 carloads, of which 2363 are lemons. Total to same date last season, 16,067, of which 1422 were lemons.

CORN HARVESTERS. It cuts and throws it in pile. One man and one horse cuts equal to a corn binder. Price $12. Circulars free.
NEW PROCESS MFG. CO., Lincoln, Kansas.

Los Angeles, Cal., June 30, 1903.

Fertilizing the Orchard

BY FRANK L. PALMER, NORTH POMONA

The subject assigned to me is fertilization. Fertilization has an important bearing upon the larger question I want to consider, for by fertilization we increase quantity and by fertilization we may also improve quality. In my opinion, the progressive orange grower will in the future bend his energies to the improvement of quality rather than to the increase of quantity.

It happily occurred to me that, in presenting this subject, it would be interesting and profitable to obtain from prominent growers in each district some account of their experience in fertilizing, and their opinions as to methods now in vogue, and to that end I prepared and sent out a set of questions which many of you have seen. These questions cover a wide range. Some of them were framed in the hope that a concensus of opinion of practical men might prove of value on certain points. This was the opinion of one of our leading orchardists who wrote me about them. But other questions were framed for the purpose of bringing out not how much we know about the subject, but how little we know as to some features of it; and if this paper awakens interest in some of these problems, and stimulates further study and investigation, that is about all it can be expected to accomplish. I have undertaken to tabulate the replies I have received. Many of the growers to whom I have sent the questions begged off, claiming that they have not had sufficient experience in fertilizing to be able to answer any of the questions, and very few have undertaken to answer them all, so it necessarily follows that to some questions I have more replies than to others. To the many persons who exercised the patience and good nature to fill out my blanks, I return my most appreciative thanks.

STABLE MANURE.

My first question was: Have you known of stable manure being used exclusively on the same orange or lemon trees for five consecutive years or more, and what was the result? "B." Did the quality of the fruit deteriorate under this treatment? "C." What was the nature of the soil? Twenty-three persons report on this question, of whom seven say they had continuous good results and sixteen say the fruit finally deteriorated in quality. Ten of the sixteen mention that the fruit became coarse and rough after a few years, and of poor keeping quality. Twelve report an increase in quantity, though five of these say the quality deteriorated. Probably our most enthusiastic advocate of stable manure is A. C. Thomson of Duarte, who says he has used it for eighteen years with satisfactory results, and on all kinds of soil. M. L. Sparks of La Verne has used it for twelve years and decimes to use anything else. And on the England orchard at Redlands stable manures are reported to have been exclusively used for ten years with good results. A large majority, however, find that by the exclusive use of stable manure an inferior orange is produced after a few years, and the replies as to the nature of the soil show that this result takes place sooner on light, sandy soils than on the heavier soils. I think the explanation is not difficult to find. The nitrifying ferments of the decomposing stable manure exercise a powerful influence upon the plant-food already in the soil, and fertilizing results are obtained, for a time, far in excess of what could be expected solely from the plant-food contained in the stable manure, but when the phosphoric acid of the soil becomes exhausted then the poor results that have been noted begin to show themselves. I look upon stable manure as a valuable fertilizer, but I think the only rational way to use it is to apply in with it a liberal amount of bone, or other phosphate, in order to keep up the supply of phosphoric acid. J. R. Moles of Clairmont reports having conducted some field-plot experiments for three years, and he and Mr. Davenport of Pomona and others who experienced poor results from the continued use of stable manure, report an improved condition of the fruit after applying a phosphoric acid fertilizer to their orchards. This practice has also the endorsement of the experiment stations.

COMMERCIAL FERTILIZER.

My second question was: Have you known of the same character of commercial fertilizer (complete fertilizer) being used exclusively on the same orange and lemon trees for five consecutive years, or more, and what was the result? Only fourteen persons report having used the same character of commercial fertilizer for five consecutive years. Of these, eleven say the result was "good crops." Two say "fair crops. "B." Did the quantity increase satisfactorily from year to year? Eight say "yes." Three say "fairly so." One says "yes for three years," and two say "Not regularly." "C." Did the quality deteriorate? Twelve say "No." One says "Yes," and one says "In some seasons yes and then followed improvement again." My impression is that there are very few who would now advocate the exclusive use of commercial fertilizers. The importance of adding humus to the soil is now universally recognized, and this is commonly done by alternating with stable manure every year or two, or by growing green crops for mulch.

IMPROPER FERTILIZER.

Third question: Do you know of any harm being done to oranges or lemons that could be attributed to improper fertilizing? If so, what? Fifteen say "Yes," of whom ten mention coarse and puffy fruit. One grower says "Half the fertilizing is improperly done," and in my opinion his statement is quite conservative. I feel very sure that in many cases harm has been done by over-stimulating the trees with large doses of commercial fertilizers. The fertilizers may have been all right, but the heavy applications that have been recommended by some of the manufacturers have been harmful and have resulted in mischief.

"Do you know of any harm being done to citrus trees that could be attributed to improper fertilizing? If so, what? Four say "No." Six say "Yes," and mention "mottle leaf;" "die-back" and "gum disease" as some of these effects.

"What is the effect on the tree of overfeeding with nitrogenous fertilizers?" The intent of this question was, how are these effects manifested? And it seems to have been so understood by most of the growers who make reply. Five say "die-back;" three say "mottle leaf and weak foliage;" and two say "gum disease."

EXCESS OF NITROGEN.

My next question was: "Do you regard an excessive quantity of dead brush on the inside of the trees as one of the effects of over-feeding with nitrogneous fertilizers?" Ten say "No." Nine say "Yes" but modify the answer in some particular, and undoubtedly most of us are of the opinion that an excessive quantity of dead brush is usually caused by the exclusion of light and air from the inside of the tree. when for any reason the foliage has become too thick.

POTASH.

"What is the effect on citrus trees of large applications of potash?" I

(Continued on Page 93.)

Scenes From the Experimental Farm of Luther Burbank near Sebastopal.

The upper picture gives a partial view between two plum rows containing 10,000 new varieties. Some of these trees, which appear quite small, have as many as 100 to 400 distinct kinds. Probably less than a half dozen will stand the test and prove of superlative value for orchard culture.

ETERNAL VIGILANCE.

The San Francisco Chronicle says: "A good many of our northern landowners are undoubtedly intending to 'butt in' to the orange business, and it is probable that some of them will make a good deal of money while their orchards are young. But with the multiplication of trees there is certain to come the multiplication of pests and diseases, nor is it possible to continually take a single crop from the land without soil deterioration, which must be made good by the restoration of humus and the application of expensive fertilizers."

Very true, but if the Chronicle will tell us what business there is in which the insects, pests or fertilizing question, or some other equally exasperating, does not come up (that is, of course, outside of the newspaper business), we will be glad to know what it is; we all want it. The careful, painstaking farmer who keeps his place always clean, always fertilized, and thriving, is the fellow who gets the "rake off," whether it is from his orange grove or a peanut patch.

It was stated at the recent institute held at Long Beach, that one grower had preferred a business in which these difficulties had to be contended with, because it was a most successful weeder of the careless workman.

The beauty spots and show places of California are not in the rich low lands, but almost invariably have been dug out of the rockier and more forbidding soil of the foothill sections. It takes a little opposition on the part of nature to bring out the best there is in the human race.

Those of our northern citrus friends who are going into the business with the idea that it is a kind of a holiday picnic will doubtless run up against the real thing before many years are past, but if they are in sections where they do not have to "farm against the climate" have good soil and abundant water, and above all have grit, there is no reason why they should not succeed in growing oranges.

LAND GRABBERS.

The "Country Gentleman" published in New York takes exception to the land grabbing which seems to have anticipated the national irrigation movement. It says truly:

"The land laws should without doubt be amended to stop this land grabbing before it is too late, if, indeed, it is not already too late. Moreover, some measures should be taken to leave the land grabbers to the enjoyment of their deserts, which they seem so anxious to secure, and spend the public money to be devoted to irrigation on lands still owned by the government or clearly in the possession of small holders in good faith. It is doubtful if there are many such small holders. Homes have not been made on arid land to any considerable extent. Actual settlement on any large scale is only possible after irrigation, and it is safe to assume that most of the private holdings in the regions of prospective irrigation are speculative. Let those lands be left alone."

Notwithstanding this, we trust this most estimable paper may realize the vast importance that this irrigation measure means to the entire country, and not the selfishness of the few who always plan to take advantage of every step for general improvement.

In all civic advancement the squatter gets in and insists on squatting while conditions about him improve, but without his aid.

There probably never was advancement without the fossil getting the benefit. Must we, then, cease to advance?

NATIONAL BEE-KEEPERS' CONVENTION.

In a short interview with George W. Brodbeck, one of a committee planning for the coming National Bee-keepers' Convention, it appears that a fine programme, and a big convention is being planned for the thirty-fourth annual meeting, which will convene at Blanchard's Hall, this city, August 18, 19, 20. Mr. Brodbeck says that this promises to be by far the best attended and the most enthusiastic meeting ever held by this association. Most of the California bee-keepers are preparing to attend, and to bring along their friends. From the east will come some of the most noted bee-keepers and editors of bee-keepers' journals. George W. York, editor of the oldest journal of its kind in the United States, the American Bee Journal, E. R. Root of Medina, Ohio, editor of "Gleanings in Bee Culture;" W. E. Hutchison of Flint, Mich., editor of "Bee-keepers' Journal;" will all be present. N. E. France of Platteville, Wis., who is general manager of the National Association will also be one of the prominent figures.

The chairman of local committees are making preparations for giving the visitors a California welcome. Those who are chairmen of the various committees are: Pres. T. W. Andrews of Corona, of the State Association is chairman executive committee; C. H. Clayton of Los Angeles, chairman of the hotel committee; J. F. McIntyre of Ventura, secretary of the State Association, chairman of the finance committee; J. M. Hambaugh, chairman of the reception committee.

From the programme, we quote one or two numbers as follows: "Honey Exchanges and Co-operation Among Bee-keepers." by Prof. A. J. Cook, Claremont, Cal.

"How to Make Money Producing Extracted Honey," by J. F. McIntyre, Sespe, Cal. Response by E. S. Lovesy, Salt Lake City, Utah.

"The Production and Sale of Chunk Honey," by Homer H. Hyde, Floresville, Texas. Response by C. P. Dadant, Hamilton, Ills.

"The Eradication of Foul Brood," by N. E. France, Platteville, Wis.

"Reminiscences of Bee-keeping and Bee-keepers in the Early Days," by A. I. Root, of Medina, Ohio.

Dr. Wm. Sherman of Fresno, while calling at this office yesterday expressed his faith in the great future of the San Joaquin valley in general and Fresno in particular. The Doctor says the Minnewawa ranch has demand for the large number of registered Holsteins which have made quite a reputation for this fine herd, the grade of which is better than ever.

EDITORIAL NOTES.

The delivery of the thirteen long-time culprits from the state prison at Folsom last week was not to the credit of the management, and should have investigation. Where the blame lies but few seem to know, but certainly such loose management that will allow a general uprising and delivery such as that can only have censure.

* * *

The great benefit which is given to our roadways by application of crude oil is fully established, and hundreds of miles of oiling has been done during this season. Riverside alone is now launching upon a great campaign of road oiling.

* * *

Santa Cruz and Monterey counties are both oiling long stretches. The work is now being placed upon a more intelligent basis. The proper oil has been determined, and the many who apply are using sand as an absorbent, and this has made a vast difference in the results. For instance, it is plainly established that the light Coalinga oil is inferior to the heavier Los Angeles of Kern county oil. The heavy asphaltum oil must be used if the best results are to be obtained.

* * *

The first term of the new California Polytechnic School at San Luis Obispo will open next month. The school is open to any boy or girl fifteen years of age who has completed a grammar school course, or who can pass an examination covering essentially the same ground. Applications to enter the school must be made on forms, which will be mailed to any one requesting. Write to Leroy Anderson, Director, San Luis Obispo, California.

* * *

The recent decision of Judge Conrey, declaring void the county game ordinance of Los Angeles is regretted by the true sportsman and more by the farmer. It is, however, to be hoped that the agitation of the question will bring about a state law which will more perfectly protect song birds, doves and other birds which are beneficial to the producing class of this state.

* * *

The first forest fire of this state has been reported from the Sierra Madre mountains, and it is wise perhaps, at this time to call attention of our readers to the fact that great care should be taken to protect our water sheds. Doubtless every one who reads these lines has sufficient care of the future of this state to observe the proper precautions when in the mountains to prevent any forest fires ever starting. Also to aid in putting out any fires that may have been left by careless campers; but the need for education is so great that every one should bear in mind that the careless youngster should be educated to the terrible consequences of playing with fire in the mountains. The state has taken the matter up, and at various times boys from "the best of families" have been given a very severe lesson. But that never undoes the great damage which may have been caused by thoughtlessness. The law provides for a fine of not exceeding $2000 or imprisonment for two years, or both, if a fire is set maliciously; it also provides for a fine of $1000 or imprisonment for one year or both if a fire results through carelessness. Therefore the youngster who may be good, but is "so thoughtless," would do well to keep in mind that the people of this state are in no temper to temporize such thoughtlessness.

LABEL THE BOXES.

For fear of neglect on the part of some grower and packer we again quote the folowing from the state law passed at the last session:

"All fruit, green or dried, contained in boxes, barrels or packages, which shall hereafter be shipped or offered for shipment in this state by any person, firm or corporation, shall have stamped, branded, stenciled or labeled in a conspicuous place on the outside of every such box, barrel or package in clearly legible letters at least one-quarter of an inch in height, a statement truly and correctly designating the county and immediate vicinity in which such fruit was grown."

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

UNITY AND STRENGTH.

The combination of these qualities is rarely found in agricultural communities in a business way outside of Southern California. But our citrus fruit growers have developed the co-operative idea to such an extent that we had hoped it would ultimately result in a universal organization, in which the strength of the entire industry could be exerted toward overcoming trouble outside the state, such as slow and expensive transportation, improper distribution of fruits and the minor evils that beset the trade as a natural result of competition with other fruits. In this we have hoped for too much, as a few growers will always be found against the ruling order of things, no matter how large, or intelligent, or experienced be the majority of their fellow growers adopting co-operative methods of marketing their fruit. Some one has said that majorities were not always right, and they are not upon matters of morals or mere opinion, where business experience cuts but little figure. So we may expect a few orchardists to stand out independently, for a time at least, and accumulate enough experience to drive them into co-operation with their fellows.

Down in Orange county, where co-operation has not been developed as it has in most other sections, the influence of a few growers is being exerted to place the attitude of the California Fruit Agency in a false light. It cannot be done by straight-out statements and must be done by indirect statement or inference. The argument is made that the agency cannot have the interest in the proper selling of fruit that the owner has. But the readers of the Cultivator know that the complainants have no method to suggest by which the owner of an orange crop can go, himself, to the market and make his sales. He must depend upon some one else and that one must be a commission merchant from very necessity. The argument then, if this is true, assumes the form of captious criticism. The grower has nothing whatever to say about the disposition of his fruit after it reaches the hands of a mere percentage dealer any more than the card player has to say about the "honesty" of the game after he surrenders his percentage to the dealer and lays his money upon the table. If the game is not played according to his ethics he can go to another resort or quit the "business." It is a case of play my way with the commission man or you cannot play at all. Those who place their fruit in the custody of the California Fruit Agency have to deal with men whom they know from long business acquaintance. A large number of these men are selected by the co-operative growers, and the others are men with whom the outside growers have dealt for years. They are engaged solely in selling citrus fruits, delegate to do this either by election, as in the exchange, or by contract with each member of the Citrus Union. It had been thoroughly demonstrated that but half of the growers would affiliate with the Exfruit pitted against the other, disfruit petted against the other, disbefore the few growers who captiously question the utility of the consolidated agency, the so-called independents cannot conscientiously object to the plan now in successful operation.

It has always been easier to tear down than to construct. But a square request to the objectors to outline some system that would be better than the one now in vogue, would display the weakness of the position now occupied by those who refuse to go into the Exchange, or to do business with the Citrus Union. They have nothing to offer but a series of small commission deals, and the fruit growing public have long since sickened at the name of a commission man.

CLIMATE AND CROP REPORT.

From the weekly Bulletin issued by California Section of the Climate and Crop Service, in charge of Alexander G. McAdie we note:

Sacramento Valley—The weather was slightly warmer. The yield of wheat in some sections is better than expected. Barley is a fair crop. The warm weather caused a rapid ripening of deciduous fruits and benefited grapes. Prunes are filling out and will yield a large crop. Grapes are doing well. Citrus fruits are thrifty.

Coast and Bay Sections.—Cool, cloudy and foggy weather continued during the week along the coast. Cool weather has benefited late wheat, which will yield half an average crop. Sugar beets at Pleasanton and Hollister are doing well; the acreage is less than last season's. Corn is looking well. Hops are backward, the yield will probably be below average. Beans are thrifty. Peaches yielding excellent crops. Sweetwater grapes at Cloverdale are nearly ripe.

San Joaquin Valley.—Clear, warm weather during the past week was beneficial to all crops. The fruit crop has developed well, and is now ripening rapidly. Large quantities of pears and early varieties of peaches and prunes are being handled. Heavy shipments of watermelons are being made from Fresno and vicinity. The grape crop is making good progress. Water is very scarce in the ditches. Stock are healthy.

Southern California.—The weather during the week was nearly normal. Alfalfa is below average in some places. Sugar beets at Santa Maria are yielding heavily, with a good percentage of sugar. Beans, corn and potatoes are in good condition. With the exception of apricots, all deciduous fruits will yield good crops. The yield of guavas will be large. Peaches and nectarines are of good quanty. Lemon picking continues. Grapes and oranges are doing well.

Eureka Summary.—Cool weather with fogs retarded grain harvest. Potatoes are improving; yield better than expected. The plum crop is extremely heavy; some orchards in northern section badly affected by rot.

GENERAL NOTES.

The total immigration into Canada for the year ending June 30th, is 124,358.

Another cloud burst has given another soaking to the people of Kansas.

After four days of balloting in the vatican at Rome, Cardinal Sarto, the patriarch of Venice was elected pope.

The United States census shows that the total number of pounds of cheese made in the United States was 298,344,654 pounds per annum.

In the last report of the Secretary of Agriculture, the statement is made that the value of water power from the region of the Appalachian mountains is twenty million dollars.

The union printers employed in the government printing office at Washington are still at their places, notwithstanding the reinstatement of a foreman by the name of Miller, who was discharged at their instigation because of his being a non-union man.

A returned Riverside orange grower says that "the orange will become one of Porto Rico's principal products inside of ten years. Many Americans are going there to plant large acreage for orange groves. Labor and transportation are so cheap that Californians must keep Porto Rico in mind."

The Farmers' National Congress will be held at Niagara Falls on September 22, 1903. The governor of New York wil give the address of welcome, and there will be papers on contagious diseases of farm animals, insect pests, and plant diseases, how can we enlarge our foreign markets, and other features of interest to farmers.

Careful and scientific experiments at Watsonville have developed the fact that if all the poison were collected from the sprayed apples, that it would require eight barrels of apples to secure sufficient poison to kill a person. Unless apple eaters are very hearty as to their appetites, there seems to be but slight danger.

Coast News and Notes

By R. A. Dague, 1045 Regent St., Alameda

Georgia this year produced only about 320 carloads of peaches.

Grape-planting will be largely increased the coming year in Modesto county.

Ten millions will be expended in the arid West in the gigantic irrigation movement.

There were 475 carloads of strawberries shipped from the Pajaro valley up to July 1.

It is now known that there will be a larger acreage planted to celery in Orange county than last year.

The walnut crop of California this year is not so large as was anticipated on account of the Walnut-Bacteriosis.

California now ships about 250,000 boxes of apples a year to Great Britain. Oregon exceeds us in that line.

A large deposit of coal has been discovered in the Peace River country. Some of the seams are nine feet in thickness.

Seven threshing machines are at work in the Santa Maria valley. It is estimated they will turn out 500,000 sacks of grain.

The Texas Horticultural Society has appointed a committee of learned men to come to California to study our methods of raising fruits.

The Alameda county milkmen, following the fashion, have formed an association and fixed the price of milk, which took effect August 1.

The Assessors report for Sonoma county this year shows the excess of beef cattle over last year to be 110. General stock 1261 in excess.

Fruit shippers of Portland charge the Southern Pacific company with discriminating against them in shipments of dried prunes and other fruits.

Last year the cotton weevil nearly ruined the cotton crop in Texas. This year a small green bug put in an appearance and is destroying the weevil.

The watermelon crop of Fresno county is unusually large this year. The growers have formed a co-operative association for marketing the crop.

The California wine manufacturers will hold a state convention at St. Helena August 15th to outline legislation desired for protection to the wine interests.

The Santa Rosa Stock Farm Association has on hand some very fine White Leghorn fowls, the stock of which came from the Pan American Exposition.

The Chinese have been all summer pouring into Mexico at the rate of 10,000 per month. The larger number later on work their way into the United States.

"Cheese-making on the Farm," No. 166 is the title of a little manual prepared by Major Alvord which can be had for the asking of the Secretary of Agriculture.

It is only recently that almond raising has been tried in Butte county. The orchards are young but this year the trees are hanging full of nuts of fine size.

Hops in Central California are looking better than two weeks ago. Reports from England, New York and other points are to the effect that the hop crop is poor.

After the deciduous fruits are harvested in Central and Northern California the farmers institute will be taken up. The campaign will run from about Oct. 1 to April, 1904.

Five thousand four hundred and seventy-six cases of Bartlett and other California pears and 2942 cases of plums were sold in London, England, July 31. They sold from 10s 6d to 14s.

Governor Pardee is taking a lively personal interest in the next State Fair. He insists that it shall be so conducted that it will give the people the best returns on the money expended.

The apple crop of the middle west is reported lighter than that of last year.

The Healdsburg Co-operative Cannery now employs several hundred hands.

Some orchardists have sprayed four different times for the codling moth at Watsonville.

The "Pajaronian" says that from a 105-acre orchard at Watsonville, there will be marketed this season 30,000 boxes of apples.

The directors of the California Raisin Growers' Association are making a vigorous canvass to secure contracts for the coming crop. The growers are slow in contracting and there is considerable friction.

The California Promotion Committee has issued a 200-page volume for distribution, giving a fine description of California. It may be obtained by addressing the Committee at No. 25 New Montgomery St., San Francisco.

The beet harvest of Ventura county is not progressing as satisfactorily as was expected. Some farmers held back because they thought by waiting their beets would attain a heavier tonnage and a higher percentage of sugar.

One of the encouraging signs of the times is the formation in Texas and California of companies to manufacture "bricquettes." They are made of crude oil, can be sold for about $1.25 per ton and will take the place of coal.

On August 1st the mills of Central California advanced the wholesale price of flour 20 cents a barrel. The price now is per barrel $4.60@$4.85. They claim that during the year flour will have to be imported into California from the States.

A marvelous machine has been invented by Roy Chaddock of Fowler for the packing or seeded raisins. The machine reduces the crew at a table from 26 to 8 persons. By it the raisins are packed into cartons, the end pieces are turned down and sealed and each carton is weighed.

At the last weekly public sale held at Santa Rosa by the Poultry Association, sixty cases of eggs were offered. The bids ran as high as 25 cents. The committee announced that the eggs should not be sold at that price, and as no higher offer was made the eggs were held over.

The California Promotion Committee has issued a magnificent little booklet, "California Today." It is illustrated with a great number of fine half-tones, and it is a credit to the committee, and will attract attention to California. It may be had by addressing the secretary, 25 New Montgomery street, San Francisco, Cal.

Judge Oster of San Bernardino county has rendered a decision in the case of the city of Ontario against the Chaffey College, in which he decided for the plaintiff the endowment of the college which was made by the Chaffey Brothers, when the college was established at Ontario, may not be used in educational work of the University of Southern California, outside of the city of Ontario.

The National Irrigation Congress is to be held in Ogden, Utah, September 15th to 18th. Then there will be a squabble over the distribution of the ten millions of government money to be expended in irrigation in California and the Rocky Mountain states. The committee having the convention in charge wants a large representation. Fred J. Kiesel, of Ogden, Utah, is chairman of the Executive Committee.

A writer in the Stockton Independent says that the yield of grain in California is not up to expectations. There will be a big shortage of grain but a very large crop of hay. Brewing barley is scarce. In the State of Washington the grain crop is better, though away below the average. In the vicinity of Walla Walla the yield of wheat will be as high as 40 bushels per acre.

Wheat harvesting is nicely under way in Washington.

Santa Rosa recently experienced a $100,000 conflagration.

Mayfield in Santa Clara county has decided to incorporate.

A large grain warehouse is to be constructed at Imperial.

Watsonville has already shipped 175 carloads of strawberries.

The Salt River Valley produces eight millions of watermelons.

A slight earthquake shock was felt in this state on August 3rd.

The agriculturists of Imperial are going down after artesian water.

The Chino Sugar Factory starts its operations tomorrow, August 8, 1903.

The Napa Fruit Cannery canned over one million quart cans of cherries.

The first forest fires of the season is reported from San Gabriel Canyon.

Imperial sends up a cry with many other sections of California for more farm help.

Pomona Cannery is talking of making experiments of a new process for olive picking.

Over 15,000 boxes of pears were bought one day at one dollar per box, at Suisun.

About 2000 acres of celery will be planted in the peat lands of Orange county this year.

Most of the counties of Soutnern California have adopted rigid automobile ordinances.

Clarence A. Shamel, associate editor of the "Orange Judd Farmer" is visiting California.

The Gilroy Advocate says that Geo. Eustice cleared over $500 per acre on apricots this season.

Santa Maria has a monster oil gusher, which is giving a boom to the oil business in that section.

The Glenn county stock raisers are arranging for a mass meeting to be held at Elk Creek in September.

The "Hanford Sentinel" says that a pest of grasshoppers there has been wiped out by thousands of black birds.

The Alameda Sugar Company, at Alvarado, announces that it will contract for beets for 1904 at $5 per ton delivered.

It now looks as if the creditors of Porter Bros. fruit concern will get but little from the assets of the embarrassed firm.

Horticultural Commissioner Rodgers of Santa Cruz county has forbidden the throwing of infected apples upon the highway.

Geo. W. Bird of Watsonville sold the entire fruit from his forty acre orchard at auction to the highest bidder for $3,458.50.

Prunes shipped to France have been reported as arriving in poor condition, and of such quality that the market is being injured.

A great irrigation enterprise is proposed for Salinas Valley. The district will comprise 5613 acres of the most fertile section of that valley.

Antelope Valley, north end of Los Angeles county is developing new lands which are said to be in admirable locality for apple cultivation.

A meeting of the prune growers of San Jose has been called for August 15th, to discuss prices for the coming season, and if possible establish a price for the season.

The crop of hops of the Pajaro Valley is reported to be very good. For the first time in the history of hop growers, spraying was resorted to, for protection against the hop louse.

About one hundred carloads of fruit are passing Sacramento each day. This means about 2,400,000 pounds of fruit. Up to the last of July about 1800 cars of green fruit had passed Sacramento.

The engineers in charge of the survey for the great irrigation system to reclaim the great Colorado River Valley, say that there seem to be obstacles in the way of its accomplishment, which may cause the work to be suspended.

Conducted by PROF. A. J. COOK, Claremont, Cal.

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

(Continued.)

We have noted that all insects or animals of the class Hexapoda not only have six legs, which gives this last name to the class, but also that they are more cut up, as they have head, thorax and abdomen, each quite distinct when mature, and that both these peculiarities, the one six legs giving the name Hexapoda, the other marked parts of the body giving the name insects, serve easily to distinguish these animals from those of the other three classes. Crustacia (water breathers), Myriapoda (many legs), and Arachnida, or spider class. We have studied the wondrous transformations from egg to larva, from larva to pupa, and then the imago or mature form. We have noticed the appendages of the head, the two kinds of eyes, those other very important sense organs, the antennae-sense organs in two senses, as they are delicate tectile or feeling organs, and also scent organs. We noted the curious and complicated mouth organs, typical for biting, where the two sets of jaws work side-wise; and modified for sucking. We also studied the legs and appendages of the thorax. These are used so much that they are greatly modified, as we should expect, and greatly aid us in classifying the great host which make up this by all means largest class of animals.

Internal Organs.—We have already seen that the head is the brain-case, and that the thorax contains within but little more than great muscles which move the legs and wings, except that the meat tube or Oesophagus passes through it, and on the under side is an important part of the nervous system. The most important part of the viscera or internal organs are in the abdomen. There need little more be said of the muscles, except that strong ones in the head move the mouth organs, and much larger ones in the thorax act upon the great legs and wings. The muscles are much like our own, except that they are not each bound in a separate sheathe or fascia, and they must be superlatively strong.

The food tube, or alimentary canal is also much like our own. Just back of the mouth is the pharynx, then the oesophagus, and this may conduct, as in the bees, into a pro-stomach or sort of a crop, the honey stomach of the honey bee. The true stomach comes next, and is where the main part of the digestion is usually done. The main digestive juices, however, may be secreted by glands, entirely outside the stomach. In the bees these great digestive glands are in the head and thorax. In most insects there are tubes connected with the stomach, usually the hinder end. These are renal, or act as kidneys. The intestines are divided into small and large, and need no further description.

The breathing organs consist of a very extensive ramification of tubes. Two large ones, one on each side of the body, connect through short tubes with the spiracles or breathing mouths which often show very distinctly along the side of the body. These show very plainly in some caterpillars as in the larva of the large tomato sphinx, the so-called tomato worm. The insect then breathes not through its one mouth, but through these many mouths along the side of its body. The two main air tubes branch and rebranch, and so reach to every part of the body. Thus the insect's lungs are everywhere, and so, air is carried everywhere.

The heart of insects is in the back high up. It makes up the entire circulatory apparatus. It receives the blood and impels it to the head, from whence it pushes back, and so bathes all the organs. There are no veins, arteries or capillaries; only the one heart, which serves to keep the blood moving. The blood is white or yellowish-white. We see why it is not red. The function of the red part of the blood of higher animals is to carry the oxygen. As we have seen, in insects oxygen is everywhere in the insect body. As the lungs are everywhere and so the oxygen needs not be carried. In our next we will briefly consider the nervous system, the glands and the reproductive apparatus.

* * *

GRAPE SPHINX.

Mrs. S. J. C., of Long Beach, finds under her grape vines a large, green caterpillar, which has done its best to defoliate the plants. She asks for name and habits.

This is the caterpillar of one of our largest and most handsome moths, Philampelus achemon. The caterpillar is green with oblique lateral lighter bands. A wart or eye-like spot takes the place of the usual caudal horn The moth is brightly colored, and is one of the most beautiful moths. If numerous it would be a pest, but it is too rare to work any appreciable harm. I have taken two or three of the beautiful moths, since I came to California, and this is the first caterpillar I have seen. In case they become numerous, which we are not to expect, then hand-picking would be the cure.

* * *

TOMATO CATERPILLARS.

E. M., Long Beach, has been seriously troubled with a caterpillar eating into his early tomatoes. He says he has lost at least nine-tenths of the crop, up to within a few days. Now the mischief seems at an end. This is Heliothis armiger, the cotton boll worm of the South, also of corn and we may say the tomato caterpillar of California, and many other sections. The moth is one of the noctuids or night-flying moths, though this flies and lays its eggs in the day-time. It is not the usually sober drab, but yellowish in color. I know of no way to fight these except to trap the moths. By close watching and hand-picking we can protect a small patch of garden corn, but this is costly and laborious, and could not reach to the tomatoes. Of course late crops are less affected. I can only suggest the light-trap or lamp-trap, and sweetened water with a little vinegar or stale beer to catch the moths. I have not tried either of these but from the habits of the moths I should expect some success. The traps must be set early when the moths are egg-laying.

California Horticulturally...

John Isaac, Sacramento

A GOOD REPORT.

The official report of the twenty-eighth Fruit Growers Convention, which was held in Los Angeles in May last, is now printed in book form by the Horticultural Commissioner, and is ready for distribution. There were a number of very able papers presented at this convention and some excellent points brought out on them in the debate. These are all compiled in convenient and readable shape in the report which is now ready for distribution and can be had by applying to the Horticultural Commissioner, at Sacramento.

* * *

ACTIVITY IN VINEYARD PLANTING.

There is a regular boom in vine planting in the northern counties, which is increasing in extent with each passing season. During the planting season just passed, there has been a larger acreage put out to vines, principally wine varieties, than ever before in one season, and arrangements are already being made to put out vineyards on a much larger scale than ever before during the coming season. This turning again toward vine planting has, of course, been the natural result of the very good prices and active demand for wine grapes in the past three or four seasons. There are two serious drawbacks to vine planting in this part of the state, and these are the phylloxera, which is now very generally distributed all over the vine sections of the northern counties, and the Anaheim disease, which is steadily increasing its area. The first pest can be circumvented by the use of resistant stock, a very expensive and not altogether satisfactory process, but for the latter no remedy has yet been discovered and its appearance is more dreaded than the phylloxera. In spite of these drawbacks, however, vine planting is going steadily on and will continue so long as the present prices for grapes are maintained.

* * *

PAINTING CUTS IN PRUNING.

It is sometimes necessary in pruning to remove some of the big limbs; when this is done they should be removed as close to the trunk of the tree as possible and the wound covered either with grafting wax or a coat of paint. This is necessary to exclude the air, keep the wound from cracking and to save the tree from ultimate decay. When a large limb is removed, the stump is subject to sun crack and in these cracks moisture will penetrate, especially if the cut is a slanting one, and oftentimes decay sets in and does not stop until the main trunk is involved and the usefulness of the tree is destroyed. It is often the case that a little paint applied to the freshly made cut, would protect it from the weather until it has had time to heal, and the tree be saved. My attention was forcibly called to the necessity for this in an apple orchard in San Mateo county, which had been pruned by a "professional" pruner from Italy a few years ago. He had cut off a number of the large limbs, some of them several inches from the trunk, and in nearly every case rot had set in and penetrated well into the heart of the tree and an orchard that might have been profitable for many years was utterly ruined.

* * *

NORTHERN COUNTIES.

It is gratifying to note the awakening of Northern California. For many years past this section has existed in a happygo-lucky, half-asleep-half-awake condition and, with unlimited resources at her door, has allowed herself to be surpassed by no more favored but more enterprising portions of the state. This was due largely to the fact that this section was almost wholly a one-crop section. Wheat from the earliest days was the one crop. In early times it paid enormously and everybody went into wheat and continued in it year after year, despite the fact that the land was cropped to death, and gradually, instead of being profitable, entailed an annual loss on the grower, who had got used to wheat and couldn't understand anything else. Wheat land was acquired in enormous tracts and gradually the whole country got into a few hands and the holders were land poor. Much of it had to be mortgaged and then got into the hands of the banks, who did not want the land, and these in many cases have subdivided and sold, or it has passed into the hands of men who have subdivided and colonized. This is the work that is now going on in the northern counties. A strong effort is being made for population, chiefly of the agricultural classes, large holdings are being subdivided, irrigation schemes are being inaugurated and diversified farming, made possible with the aid of water, is gradually encroaching on wheat farming. Dairying, stock-raising and fruit growing are increasing in all the northern counties, and this increase will continue with increased ratio for many years to come. There is but one California, but there's lots of that, and everybody in the east wants to come here and he will come when he can afford it. It is pleasant to the writer to note the improvement noticeable in agricultural and horticultural lines which has started in the north in the past few years and which is increasing with every passing season.

FERTILIZING THE ORCHARD

Continued from first page)

have not been able to find any grower who will concede that his trees have been hurt by the use of potash, though I can easily understand how such harm might be done, and I have understood that unfavorable conditions exist in some orchards that have been attributed to that cause. The proper and rational use of potash is, however, coming into favor as evidenced by many replies. One of the most intelligent and observing of all our orchardists writes me: "We have in the past too much neglected its use."

"What is the cause of scaly-bark gum disease?" This question brought out a variety of answers: Nine say they "Don't know;" two say "Nitrogenous fertilizers;' two say "Bruises from cultivating;" two say "excessive watering;" one says "water standing around trunk;" two say "earth baking around trunk;" one says "mal-nutrition;" and two say it is a "bacteria disease." Here is a vivid illustration of one of the needs we growers have of scientific assistance from the government and state. This disease is unquestionably doing an immense amount of damage in our orchards, and is very general, and it is not probable that we shall be able to successfully combat it until we secure the services of a government specialist to ascertain its cause. An experiment station devoted solely to citrus fruits, and located in an orange growing district, would be of incalculable benefit to our industry. What stands in the way of our making a "long pull, a strong pull, and a pull all together" to obtain the establishment of such a station at Riverside?

The next two questions relate to the time of year to apply potash. In the replies all agree that it is best not to apply it during the winter, and nearly all agree that summer and fall are the proper times to apply it.

What effect have you noticed on the fruit from applications of potash? The answers to this are all favorable to the use of potash, in various expressions as follows: "Firmer fruit and less puff;" "Sweet and juicy fruit;" "Improved quality;" "Smoother fruit;" "Good color."

NITROGEN.

What is the best time of year to apply nitrogenous fertilizers? This question was not clearly put? I should have defined the form of the fertilizer. The answers imply the general opinion that animal manures may be applied at any time of year, and that the best time to apply commercial fertilizers is in the spring and summer.

Have you noticed any puffing of the fruit that could properly be attributed to nitrogenous fertilizers applied while the fruit was maturing? Six growers say "Yes." In sections where oranges are apt to puff, this is a question that may be worthy of more study. My own idea is that heavy applications of nitrogen during the winter time is a mistake.

Is there any advantage in applying a complete fertilizer early in the winter time, say December, over an application made in February? Eight say "No." Six say "Yes." I should vote "No" on this.

Have you had better results from applications of complete fertilizers made late in the spring, say in March, than from applications made earlier in the season? Three say "Yes." Nine say "No."

BONE MEAL.

The next three questions relate to the use of bone meal: What results have you had, or observed, from application of bone meal; either treated or untreated with acid? Eight say "Good results;" Two say "Excellent results;" Five say they "Could see no results;" and one says it is "Disappointing and unprofitable." "B." Did it have the effect of producing a large crop? "C." Did it have the effect of producing smoother fruit than previously grown? Seven say "Yes" and six say "No." Could anything illustrate more clearly how far apart we are on the subject of fertilization. We are growing oranges under very different conditions in the different districts; great and important differences exist in soil; in the quality of the water used; in the quantity of water available; in the temperature of the summer months ;and occasionally, (or semi-occasionally) in the temperature of the winter months. So, in a measure, it is true that each of us must study his own conditions and work out his own salvation. But there are underlying principles in this science of fertilizing which are true and applicable in every locality, and these principles should form the basis and foundation for all our practice.

Have you used bone meal, or dissolved bone, in connection with stable manure, and with what results? Six say "Good results;' one says "Poor results;" and one grower says the combination makes an "Ideal fertilizer."

SUPER PHOSPHATES.

Have you known of superphosphate made from phosphate rock to be applied by itself and with what results? Only six answer this question. Three say "No results;" one says "Results uncertain;" and one says "Do not like it." C. F. Streight of Riverside writes me that he is using the raw phosphate rock, untreated with acid and maintains that it is the rational thing to do. He says that where there is sufficient humus in the soil the untreated ground rock is available, and quotes several bulletins of Eastern experiment stations in support of his contention.

The next question asks for report of experience with Thomas phosphate, or slag phosphate. Three say they used some of it unsuccessfully. One says "Results uncertain." One says "In connection with nitrate of soda, results fairly good." One says "Seemingly good in connection with manure and drainings from a dairy corral." One says results "only moderate." Mr. Corwin of Highlands says "Have used twenty pounds per tree in one season. It improved the fruit after an overdose of guano."

GREEN MANURING.

Is the growing of peas as a soil mulch successful in your district? Twelve persons report that it is not satisfactory; the complaint being in some instances that it takes too much water. Fourteen persons report that it is a success, and some are enthusiastic over it. The most pronounced measure of success with peas seems to have been made at Redlands. C. C. Teague of Santa Paula reports very encouraging success with "Fenu-Greek plant," (native of Algeria,) which he says made double the quantity of mulch that peas did.

What variety of peas do you plant, and in what month do you plant them? Nearly all who are using peas say they plant the Canadian field pea, and sow them in Septemb or October.

Are Southern cow peas planted in your district, and do they promise well? Several report that they have been planted this season, but only two express any opinion about them. One says "Can not recommend" and the other "They do not promise any great degree of success." I made three plantings of cow peas, in an experimental way, this season; two small plantings in March and one the 25th of April. The latest planting did much the best, but neither made a satisfactory growth. I have discovered that they should not be planted till the warm weather comes; then if one gives them plenty of water and plenty of cultivation a quick and satisfactory growth can probably be secured. I propose to try them again, for I regard this matter of a soil-mulch as an exceedingly important factor in rational fertilizing.

Since I received the above mentioned reports I have been shown photographs of two patches of cow peas grown by J. F. Humphreys of Riverside which show a growth to a height of three feet in about six weeks. These were planted in June.

COST OF FERTILIZING.

Which is the most costly fertilizing per acre, as practiced in your neighborhood, fertilizing with animal manures or with commercial fertilizers? Thirteen say "Animal manures;" four say" Commercial;" three say "Not much difference." It strikes me that, in many cases that have come under my notice, fertilizing with animal manures was decidedly the most costly. Manure costs, spread in the orchard, three to four cents per cubic foot, depending upon the quality of the manure and the length of haul. I know a number who have used ten feet to the tree, which, at the minimum price of three cents per foot, makes the cost 30 cents per tree; pretty expensive fertilizing.

The same men used in other seasons ten pounds of commercial fertilizer to the tree, at a cost not exceeding 20 cents per tree. In these cases the alternating with stable manure was principally for the purpose of adding humus to the soil, and a coarse quality of manure was used, containing much straw. Five feet of the best quality of corral manure costs as much as ten pounds of the highest priced commercial fertilizer.

SIMPLE VS. COMPLETE.

Do you find it practicable to use the "simples" rather than to purchase complete fertilizers? I have twenty-two replies to this question. Fifteen say "No." One of them writes: "In the absence of any decided or trustworthy advice, one is apt to let the fertilizer men try what they can do." Seven say "Yes," one of whom remarks: "It is the only business like method." I have heard strong arguments on this point, both pro and con. My idea is: Know first what you want. Know secondly what you get. If you can get what you want from the fertilizer manufacturers at a reasonable price, better let them do the mixing for you. Just here the value of our new fertilizer law becomes apparent. It will not be long now before the commercial value of every brand of fertilizer sold in California, based upon its actual plant-food contents, will be published for the benefit of the consumer by the Director of the Experiment Station, Dr. Hilgard.

REVERSION.

The four questions relating to the reversion of phosphates may be considered together. One of these was: Is it your opinion that in the use of superphosphates (either alone or in complete fertilizers) there is a very material loss in the soil by reversion to an insoluble condition? Of the twelve who make reply to this question, six say "Yes," and six say "No," one of the latter remarking "No loss whatever."

I understand the matter in this way: We all know that nitrogen, in some forms, is subject to material loss by being leached out of the soil; this, however, is not the case with phosphoric

FERTILIZING THE ORCHARD.

(Continued from first page)

acid. The chemists tell us that seldom is there found more than traces of phosphoric acid in drainage waters, even when heavy applications of soluble phosphoric acid are followed by heavy rains. The reasons why there is no loss in this particular way is because after the soluble phosphoric acid becomes distributed in the soil a process of fixation rapidly takes place, the phosphoric acid uniting with the lime and other alkaline bases present in the soil. This process is what is commonly spoken of as "reversion. If there is plenty of lime in the soil the lime will be the first of these alkaline bases to get the acid, and the reverted phosphoric acid is then just about as valuable as it was before because, in this form, it is still available to the roots of trees.

If, however, there is not much lime in the soil, but a good deal of iron and aluminum, these bases will get the acid, which, particularly in the case of iron, would pretty effectually lock it up, and it is in this respect that possible loss of phosphoric acid takes place. It is also true, and it is an important point, that the phosphoric acid which at first united with the lime may be further acted upon and will probably be less available the longer it remains in the soil, therefore it behooves us to apply our soluble phosphates in small quantities. From every point of view, in fact, the application of fertilizers in large doses is wasteful, and often harmful. Prof. Hilgard writes me that in soils very rich in iron, phosphoric acid may become "locked up" and lost, as it is in the Hawaiian Islands, in some of which 60,000 lbs. per acre of phosphoric acid are utterly useless because combined with iron." Mr. Sardy of the Armour Fertilizer Works tells me that in the cotton states the fertilizers used contain chiefly soluble phosphoric acid, and, no matter how much is used, it seems necessary to make an annual application.

To the query, then, "Does soluble phosphoric acid revert in the soil?" the answer would be yes, it reverts quickly whatever its source, bone, rock or other sources; it probably does not remain in a water-soluble condition for a single week. To the next query, "Does this imply that the quantity not appropriated by the trees in a week after its application is totaly lost?" the answer would be "No." Does it imply a partial loss of this unappropriated quantity? Yes, in some cases perhaps only a very slight loss, in other cases a material loss, depending more upon the character of the soil than upon any other factor, but, naturally, the more soluble the fertilizer the greater loss. Hence it is that the manufacturers of bone fertilizers aim at putting out a product that is not to such a degree water-soluble, as is (necessarily) the superphosphate made from rock.

"But," says a recent West Virginia bulletin, "if the soluble phosphate is quickly converted into an insoluble form, it may well be asked what has been gained by all the trouble and expense of converting the insoluble phosphate into soluble form. The answer is largely a matter of distribution. When the soluble phosphate is applied to the soil, it quickly passes into solution, and as the soil water is never at rest, the phosphate solution soaks through the soil in every direction, bathing every little particle of sand and silt and clay, and gradually being deposited among them as the necessary lime is found. These deposited or precipitated particles are extremely minute, and so expose an immense amount of surface to the action of the soil water. We have seen that the fineness of the particles of ground bones and ground phosphate rock has much to do with their availability, but there is a far greater difference between the size of these precipitated particles and those of the finest ground bone than there is between the latter and the original bones." Then, after speaking of untreated rock and untreated bones, the author says: "The greatest disadvantage of such materials, however, is that when applied to the soil they remain where tehy fall. They may be scratched about more or less by the harrow or the hoe, but even if the field could be shoveled over or run through the most improved disintegrator and mixer the best that could be hoped for would be a comparatively inert particle here and there. The case is altogether different when the soluble phosphate is used, for the deposited particles are not only readily available when needed, but they are so thoroughly incorporated with the soil particles that they are everywhere within easy reach of the plant roots." This, expressed in a simple, or I might say a "soluble," form is my understanding of the somewhat insoluble question of the reversion of phosphates; freed and liberated from all the "bi-calcic," "tri-basic," and tetra-calcic" combinations into which the subject, as well as the stuff, is often converted.

EXPERIMENTS IN PROGRESS.

There only remain on my list of questions those suggesting that it is our privilege to look to our State Experiment Station for such enlightenment and such advice as we need on the subject of fertilization. My question suggesting that if soil experiments are needed they might be carried on at the Southern California Station has been somewhat misunderstood; that was a sub-question referring only to the problem of the reversion of phosphates. The replies indicate a general feeling that we need a station more favorably located for the growth and study of citrus fruits and all the problems incident thereto, with which feeling I heartily agree. I was pleased to learn from Mr. Mills recently that he is contemplating experiments with green manuring crops grown in the summer time, including summer crops grown with commercial fertilizers as "catch-crops," hoping to get better service from commercial fertilizers in that way. He also tells me that a series of field-plot experiments with the different fertilizing elements are being conducted at Redlands at the instance of the Propaganda for Nitrate of Soda, but under the direction of the officers of the Southern California Experiment Station. I feel very certain that the director of our State Agricultural Experiment Station, Dr. Hilgard, and all his associates, have a genuine desire to do all in their power to advance our interests, and that they will co-operate with the growers in every practical way to that end.

This is a rambling paper, but I think it may prove a suggestive one. It is evident that we, as growers, are pursuing all sorts of methods in our fertilizing, but unquestionably there is one thing we should all aim to do and that is to improve the quality of our fruit rather than to increase quantity. In this way each will assuredly benefit himself, and can in an important way benefit the entire orange industry.

FARMERS' INSTITUTE.

The Institute at Long Beach last week increased in interest to the last.

The best part of the institute is the part which comes after it is all over. Not that it is a "good riddance" proposition by any means, but the thoughts which will work out in action as the result of such institute and, better, the organizing and gathering together the information to make it of future use.

The Thursday afternoon program had, besides the university specialists, a fine paper on civic pride by Mrs. L. F. Darling of Riverside, which was an inspiration to all who heard it.

Friday morning Roy K. Bisnop spoke on Bacteria and the Rancher.

In the afternoon Dr. V. A. Moore of Cornell University gave one of the most learned discussions of the institute in Microbe Diseases, and in the evening Dr. Ward of the State University gave a learned discussion of cattle diseases with special reference to Texas fever.

Some of the treats of the week were on Saturday. Prof. C. B. Sumner gave "Farm Organizations," which had so many valuable points that its publication was suggested. It will be one of the after benefits. Mr. Palmer's paper on fertilization appears almost in full on first page of this issue.

Chas. Cassat Davis of Los Angeles spoke on road improvement and the effort of the County Highway Commission of Los Angeles county to secure systematic road work in this county.

The Committee on Legislation reported and the publication of the recommendations was requested that more intelligent action may be taken at the midwinter institute of Clubs at San Diego in December. The resolutions are:

We recommend that the law governing the appointment of Horticultural Commissions be amended so that it may not be used for political purposes but shall secure the appointment of commissioners, inspectors and other officers, on a civil service plan.

We recommend road legislation to be based upon the New Jersey or New York laws. Such changes in constitution as are necessary to secure the best results are also recommended.

We recommend the amendment of the constitution to permit of direct primaries and direct legislation.

We recommend the adoption of such laws as will better control the introduction of new insect pests; also liberal appropriations for enforcement of such laws, and the securing of natural enemies to pests now in the state; also appropriations which will enable the State University to keep more expert investigators in the field.

We recommend the shortening of the open season in which doves may be killed.

We recommend that the next legislature be called upon to continue the appropriation made for carrying on the Farmers' Institutes by the State University.

We recommend the passage of a state law whereby the road tax for main road purposes shall be equally borne by the cities. At the present time the cities of the state contribute nothing toward the maintenance or construction of any of the roads, although they are fed by the main roads leading from them.

We recommend the adoption by the postal department of the Parcels Post.

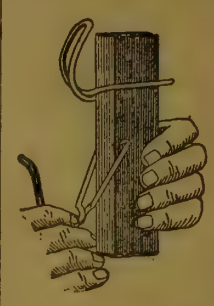
We recommend the enactment of a National Pure Food Law.

We recommend a National Quarantine Law, which will give power to shut out fruits and plants from countries where plant pests or diseases may exist.

BEE SUPPLIES—G. G. Wickson & Co, 123 N. Main Street, Los Angeles, Cal.

FREE We are going to give away, to the readers of the "Cultivator," a limited number of THE SULPHESIA CUPS, so that one or more is placed in every community, absolutely free of cost. These wonderful health-giving cups make a delightful Mineral Water in two minutes, and keep the system in perfect health. Write at once for Cup and particulars. AGENTS WANTED. THE TRADERS' ASSOCIATION, Los Angeles, Cal.

Be Sure and Get



Woodward's Adjustable Prop Bracket

The Only Bracket That Will Adjust Itself to Any Prop

They are cheaper than any other Prop Bracket that can be made, and will positively not get out of order. No nails or splice to break; no time spent in repairing; can be padded if you wish without nailing. Stand props as near the bottom of trees as possible and they will not be in the way of cultivation. If the Bracket is sprung apart so as to go on part way of the Prop it will take a side hold and will never slip. If the Bracket should be too loose press the sides together so as to make a little friction on the sides of Prop and it will stay in place better while being put up.

Having reduced our price to $17 per thousand, we would be pleased to have a continuance of your patronage and can fill all orders promptly.

THE BEST ROSES.

The question of what roses to plant in any particular locality is one that can be settled satisfactorily only by experiment; but a list of those which do the best in Southern California under most conditions of soil and climate is not hard to determine. Such a list would be valueless, however, if no note was taken of the colors, so that we aim to give below a selection of sorts that will most nearly satisfy the wants of all. Descriptions of colors and other valuable points are included. All roses vary somewhat according to soil and care.

Bush Roses.—Marie Van Houtte: Pale yellow, tips of petals and outer petals tinged with rose, large and full. Madam Lambard: (the writer's favorite). The best all purpose sort, rich salmon pink. Maman Cochet: Fine pink, sometimes salmon tinged. Papa Gontier: Carmine bud, changing to deep rose, very free bloomer—semi-double. Kaiserin Augusta Victoria: The best white, large and full. Laurette: A delicate blush, in winter often white—will stand more frost than other rose blooms. The Bride: (White Catherine Mermet) Outer petals and tips of balance tinted rose. Catherine Mermet: Flesh color—often pink, vary fragrant. Meteor: Deep crimson, the darkest of this list. Perle des Jardins: Straw color to canary yellow, large and full. Caroline Testout: Clear pink, an exceptional rose, blooms well in hottest weather. Eliza Sauvage: Pale yellow or white with yellow to orange center. Pauline: Deep rose, unusually large—an improved Paul Neyron.

Climbers.—Lamarque: Pure white or (generally) shaded yellow in center Marechal Neil: Deep sulphur yellow, large and full, finely scented, likes partial shade. Climbing Souvenir de Wootton: Magenta red or deep crimson, large and full. Reve d'Or (French for "Dream of Gold") Saffron or fawn color. Climbing K. A. Victoria: Pure white, very fine. Reine Marie Henrietta: Cherry red changing to magenta. Gloire de Dijon: Buff with orange center, sometimes very large and full—likes partial shade.

* * *

FOR WINTER FLOWERS

One of the best winter flowers we have are the freesias and they may be planted any time during August or September; in fact it is best to make two or more plantings a month apart. The bulbs are cheap and grow in any soil with little care. If planted in bed or border a part may be flowered each week merely by controlling the water supply. They should be kept growing for three months after flowering, to make new bulbs, after which dry off gradually.

* * *

PLANTS FOR SOUTH SIDE

"A Reader," Covina, Cal., wishes to know what plants will do well on south side of house in that locality and states that they lost many things planted in the sun.

If "A Reader" wishes further information from this department, his or her name must be signed to the request, not for publication, but as a guarantee of good faith and also because we wish to know all our correspondents. This rule will be strictly adhered to in the future—a rule which all periodicals follow.

The number of plants for growing in the hot sun is almost innumerable, but if in a very hot, dry position, lavender, petunias, poinsettia, plumbago, aloes, agaves—a cactus garden are among the best. The climate at Covina is not a harder one in which to successfully garden than is that of Los Angeles and it is probably a lack of care or water that is the trouble in this case. Of course the season is too far advanced now to successfully start a general line of plants, though those mentioned above will endure present weather. Start early in the new year and you will be more successful.

AN INTERVIEW WITH LUTHER BURBANK.

J. A. W. Gates who is traveling in the interests of the Cultivator, in the rich country along the coast north of San Francisco, had a short interview recently with the "Wizard of Horticulture" Luther Burbank, at his home at Santa Rosa.

Some new productions of this tireless investigator were shown to Mr. Gates, and the interesting talk brought out some points which may be of value to our subscribers. Of course, Mr. Burbank is intensely in love with his calling, and with his plants which he treats as if they were his pets. He kindly showed the Cultivator representative some of his new productions, and gave some notes regarding their worth.

Among these many new fruits and nuts, and the points which Mr. Burbank gave regarding their qualifications, we refer to only a few.

In almonds he has developed a new soft shell which he has named the "Santa Rosa." It blooms late, ripens early, in size it is medium to large, the flesh is very white, and of fine flavor, entirely free from any rancid or bitter taste. This nut requires no bleaching, the hull is medium thick and the nut is classed among the soft shells. It has proved in the northern section of the state a sure bearer, the reason for which is given that the blossoms are self-fertilizing.

Mr. Burbank has made extensive study as to crossing of the California and the eastern black walnut, as a stock on which to bud the soft shell English walnut. He finds this gives the best grafting stock for the English walnut he has ever tried, the strong point being the rapid growth of the bud on this stock.

In chestnuts, he has developed and improved the Japanese chestnut which bears eighteen months from the planting of the seed, and as a general thing the grafts bear the first year, often when the shoot is only eighteen inches in length. This is pronounced by many to be the most remarkable plant that has ever been produced in the nut family, for as a rule the chestnut does not begin to bear to amount to anything until fifteen or eighteen years of age.

A novelty in name and in fact is the Plumcot, which is a cross between a plum and an apricot. In flavor it is unique, has a soft fuzzy skin, and promises to be a favorite in the fruit markets.

Another product which is almost as astonishing as some other products by Mr. Burbank, is the new quince, which may be eaten fresh, similarly to the apple, it cooks tender, within fifteen minutes, it baked and relished like an apple, yet it has a peculiar quince flavor.

Other special features which Mr. Burbank has developed is the Crimson Winter rhubarb, roots from which were sold to the King of England; a new peach, resistant to curl leaf, large size, small pit, good for both canning and drying, firm and of high flavor; a large variety of California wild flowers on which he is now working and improving. Speaking of peaches, we may be interested to know that at this experiment farm there are over 10,000 varieties of peaches and nectarines. On some single trees there are as high as 200 and 300 varieties of buds inserted. There are 100,000 varieties of apples, 6000 quinces, 40,000 different kinds of plums, and many other kinds of fruit which have been hybridized and crossed in all imaginable ways.

This gives a mere hint as to the vast experiments constantly going on with fruits and flowers.

The Shasta daisy is known to probably all in this state, at least by reputation, although some say they have never yet seen this wonderful flower. At any rate all have seen the original daisy, which is from a strong thriving plant, will sometimes reach the size of one and a half inches. The Hybrid or Shasta daisy often reaches the enormous size of five inches in diameter. It produces more flower blossoms for a longer period, and is whiter than the original, scatters no seed, and does not become a weed.

One feature of flower culture of which Mr. Burbank is a specialist, and of which he has the finest collection in the world is the Amaryllis. He has studied the Amaryllis for over nineteen years, and has some of the finest and rarest plants in the world.

The cut on first page gives a faint idea of the experiment farm which has given so many wonders to the world.

THE INFLUENCE OF GREAT BULLS—II.

The sale of the imported Jersey bull Forfarshire at so low an auction price as $1750, though it topped the Linden Grove sale last month, has stirred up quite an outburst of regret among the sale absentees. I understand that Mr. Cooper was commissioned to buy him at a very considerable advance before he was shipped away, by a gentleman who did bid on him up to $1500, but who, not having expected to buy a bull that he supposed would sell anywhere from $4500 to $7000, did not pull himself together quick enough to grasp the full meaning of the opportunity until too late. Since then, I understand that an offer of $5000 has been submitted through Mr. Cooper, but the Filston Farm people say that he should be worth $10,000 to their herd. Mr. Cooper told me after the sale that he had it at his tongue's end to offer $2500 for him back again, but moment after he was struck down, but refrained lest it be construed as done for effect. In commenting on Forfarshire since, Mr. Cooper writes:

"We have said the truth all along about him—that we were selling him a year too quick. It does sound like bold talking to say that two-year-old Jersey heifers milk from 18 to 20 quarts daily, but that was nothing more than the truth, as we had quite a number, both by Forfarshire and Flying Fox, that milked that amount, and Filston Farm's herdsman says that after their journey on the cars some of them milked up to 8 quarts."

Forfarshire met the market practically as a high-pedigreed, untried bull, and illustrates in a measure the class of pedigree I spoke of as desirable in an untried bull under this caption. His dam, Sultanne's Rosette, has produced two other very great bulls (Flying Fox and Ravachol), and still two others (John Bull and Rosette's Golden Lad), evincing much merit as far as tried. Forfarshire's sire, Picton, was not as fashionable as either of the others, but was a grandson of Golden Lad, and had three close crosses of Wolseley, all of which were nicking strains for Rosette, as abundantly proved elsewhere. His first heifers in milk are grand, and if not quite as "pointy" on first calf as the earlier-maturing "Foxes," promise to grow into working dairy types later on that will make even the Ravachols look to their laurels. Those who recall Agatha and Bereford Darkie, by Ravachol, may think this quite a task, but it seems to me that some of the Forfarshires and Foxes are heading for like type.

An imported bull originally selected on high pedigree and said to be fulfilling consequent expectations, is Financial King, at the head of Mr. William Rockefeller's "Rockwood" herd. He was by Caumais Lad, a grandson of Golden Lad, and his dam, Finance, was a sterling winner in the island public tests. She made 21lb. 10 oz. of butter, Jersey weight, in 24 hours, in public competition, and was an enormous milker for a Jersey, having yielded as high as 55 lb. in a day. But her performance was not exceptional in her family, for her dam, Interest, had nine daughters, all very remarkable milkers, and eight of them competed or else were credited with private butter tests of so high a character as to give prestige to the "Interest family" as "the greatest churn family in Jersey." Caumais Lad, who got Financial King, was out of Blue Bell, a not fashionably bred cow, but her blood must have been good, for to the cover of Golden Lad she had Golden Lad's Blue Belle, that topped the females in Mr. Cooper's recent sale at $1725, and to the cover of Nunthorpe had Blue Nun (18.5), sweepstakes cow at the Ohio State Fair, 1891, both of which are now owned at Belmore Farms.

The selection of bulls at Rockwood has always been very carefully considered. The Owl, five times inbred to old Sultanne, and out of Alicante (island champion), the great daughter of Rosette (island champion), preceded Financial King, and died there some two years since. The Owl (a Rosette bull once removed) compared with Ravachol and Forfarshire in the type of his best daughters. In recent years, an occasional daughter of The Owl has been imported. I find only eight that have been sold at auction, but as their average price was $557.50, it will be seen how good they were. A bull, to get a place at Rockwood, must either have been tried very high or else be of the very highest caste in blood. It was M. B. Hakls, the superintendent of this establishment, that forced Mr. Cooper to pay $2250 for Golden Fern's Lad at F. S. Peer's recent importation sale.

Golden Lad (twice inbred to old Sultanne) is so generally conceded to be the most remarkable improver of island stock of his day and generation, and every cross of his blood is valued by such breeders as have studied its influence. It promises to permeate every good thing on the island, as the blood of Old Noble did 40 years ago. The immediate daughters of Golden Lad are now getting scarce, but their magnificence is still vivid in the public eye. I do not believe that any man can name the best daughter of Golden Lad, though time may single out one whose influence in the field of breeding will entitle her to that distinction. There were many daughters of Golden Lad capable of producing great bulls, and one of them had Golden Fern's Lad in evidence of how great their bulls may be. Mr. Cooper reports it as the broadcast consensus of opinion that the island cow Lady Duwish, first over Jersey, a Blythwood and great English winner, was the greatest individual among Golden Lad's daughters. She was bred to her own sire, and in England dropped the bull Beresford Climax. By many people, such close inbreeding is thought hurtful, but for some reason a degree of it works better with cattle than with most other kinds of live-stock. The wonderful cow Jersey Belle of Scituate was by Victor out of one of his own daughters. Golden Lad's blood, by wide experience, has been found to thrive with inbreeding, both near and distributed, when alternated with harmonious out-

TO FARMERS, STOCKMEN, DAIRYMEN:

SUGAR BEET PULP
(Kow-Sauer-Kraut)
also MOLASSES
FOR SALE

"KOW-SAUER-KRAUT" 50 cents per ton F. O. B. cars fresh from factory. Conceded to be the cheapest and best dairy food in California. Write for freight rate if too far to haul.

MOLASSES, 75 cents per barrel. Consists almost entirely of carbohydrates, (sugars) cheapest and best food for fattening stock of all kinds. Send for testimonials regarding feeding value of molasses for working horses, fattening cattle and growing pigs and calves.

Los Alamitos Sugar Co., Los Alamitos, Cal.

ANOTHER PROP KNOCKED FROM UNDER HIM

Our "would-be competitor" the DeLaval Separator, in his efforts to counteract the fact that the U. S. Separator is the better skimmer, has tried various schemes to prop up his trembling frame and waning popularity.

He used to try the "Churnability" bluff, but this prop was knocked out long ago; then he howled about flushing the bowl with hot water, but the U. S. corrugated cups quieted him on that; and lately it has been the "cold skimming" dodge, whenever he has run up against the U. S., but alas this also has been knocked from under him, so that now about all the prop he has to lean on is that of "bluff."

That readers may fully realize how little ground there is for advocating cold skimming, we give below a portion of an article that appeared in the June 18th issue of *The Kansas Farmer*, headed "Abuse of a Hand Separator," by Prof. Edw. H. Webster, formerly of the Kansas Agricultural College, and now one of the Government Dairy Inspectors:

"Other abuses were in time met with in the tendency of agents to follow methods that would be condemned anywhere else. One of the principles of separation understood by all creamerymen, is that the warmer the milk the more complete the separation. Yet agents will run cold milk through just to beat the other fellow. This is wrong for various reasons:

"In the first place the milk should be skimmed when warm in order to get the best separation of the cream.

"It should be skimmed when warm in order to give the calves and pigs the warm skimmilk, and

"It should be skimmed fresh from the cow in order that the cream may be quickly cooled to prevent the development of bacteria.

"Everything is against cold skimming and in favor of warm skimming, and the tendency of these contests is to give farmers erroneous ideas in regard to the hand separator."

What further evidence is necessary to convince you that the DeLaval has to depend on other things than its merits to sell its goods?

Remember, the U. S. Holds World's Record

For further particulars as to its merits, write for catalogues.

With the exception of three or four venomous varieties of snakes, all reptiles are active friends of the farmer. They are the most voracious insect eaters of all animals. Snakes, toads, frogs, lizards, etc., should be carefully protected. Beneficial snakes should not be killed, simply because their shape and manner of locomotion do not suit us.—Farm & Ranch.

crosses. Beresford Climax was bred to Ravachol's great daughter, Beresford Darkie, and produced my bull Beresford Noir, which I regard as of exceptionally high pedigree. The risk, however, comes in venturing upon blood crosses that are largely experimental. My herd is based on Eurotas blood, modified by Welcome crosses, and I hope that the new cross will develop a happy nick. The nearest parallel indication that I have yet seen is in the old Darlington herd, where Golden Lad's Champion, son of Golden Lad, has been used upon cows kindred to mine with results as promising as could be desired until the heifer shall come in milk.

Golden Lad 2d, an island bull by Orme (son of Golden Lad), out of Golden Lass (the second dam of Golden Lad), has proved a remarkable sire, and seems always to add value to a pedigree. Only five of his get, one bull and four daughters, have been imported to this country and sold at auction, but so good were they that their average price was $796 each. It was a son of this bull, Orlando, that got Dr. C. E. Still's bull Rosette's Golden Lad, the first calf that Rosette dropped in this country. Like her older bulls, he should prove a great sire, but his oldest heifers are not yet due at the pail. While Golden Lad 2d had no extensive opportunity on the island, many are inclined to rate him as great a sire as old Golden Lad. His sire, Orme, son of Golden Lad, had the forceful Oxford Daisy cross from his dam. Orme got the great sire Ravachol, out of Rosette. The breeding of Rosette's Golden Lad, therefore, has precedent in that of Ravachol to indicate that he is capable of becoming a sire of remarkable dairy cows.

Rosette's family (i. e., those descendants which reach her in the direct female line) have cut a prominent figure in auction history. Three of her sons, one of her daughters and two daughters of the latter, making six in all, have sold at auction at an average of $2129.16. Besides this, she produced Alicante, a cow that was champion over the island and a sensational figure in England, and the latter produced The Owl, a bull whose success as a sire I have previously noticed.—Hark Comstock, in the Country Gentleman.

DAIRY NOTES.

Arizona seems to be the center of attraction at the present time in the dairy line. A company with a $50,000 capital is preparing to build a condensed milk plant at Tempe.

The quotations on butter in San Francisco during the first six months of the year were: January, from 30 to 31½ cents per pound, in February from 33½ to 35½; in March, 25½ to 29; in April, 21 to 24; in May, 21 to 23½; in June, 23 to 24½, and in July, 24½ to 25½.

The new "Holstein-Fresian Year Book" is just issued. It contains advanced registry reports of cows and sires of the year 1902, also many half-tone illustrations. It may be had of Frederick L. Houghton, Putney, Vermont.

An announcement is made by the University of California that the Dairy School will open on October 6th, and will continue ten weeks. Prof. Major will be at the head of the school and will be assisted by a corps of practical workers.

The Kings County Dairymen recently formed a co-operative organization and already they are securing the results of their union. They have contracted the milk of nearly 3000 cows at a good price.

A company is to be organized to build a condensed milk factory at Logan, Utah.

James Martella will erect a cheese factory at Dallas, Kings Co.

A movement is on foot to erect a creamery at Nicolaus, Sutter Co.

The DeLaval Dairy Supply Company are installing a refrigerator and ice machine in the Ceres Creamery. The creamery has a capacity of 500 pounds of butter daily.

The Kings County Creamery at Hanford reports a product of 3000 pounds of butter daily.

The sale of Sadie Vale Concordia, the Holstein-Fresian cow, was made recently for the neat sum of $2200. Her son, Paul Dekol, went at the same sale for $2300. This cow is said to be champion producer of butter.

BEE SUPPLIES—G. G. Wickson & Co., 123 N. Main Street. Los Angeles, Cal.

H. Michaels, the proprietor of the large Santa Monica dairy, has just received a car of Holstein cows from Guadaloupe. These were purchased to grade up the dairy and at an average cost of $75 each.

Woodland Creamery reports 22½ cent per pound as the average for all butter sold for the past five years. Also an average of 4½ pounds of butter to every 100 pound of milk.

E. M. Wheeler of Santa Ana has added to his dairy the two fine heifers, Trustee's Duchess, and Vela's Maggie, from the herd of C. W. Leffingwell, Jr., Whittier.

JERSEY FAIR.

Messrs. Platt and Campbell of the committee on holding a fall fair and butterfat test are now getting into line with plans which mean a big meeting for this fall. Various members of the association are reporting cows which they will have in good condition for that meeting. The friendly rivalry which will exist to take off the ribbons of the fair, will give a show which will merit attention from every lover of high bred stock. One feature will be the butter fat test, which will be in the hands of a thoroughly competent and disinterested person, so that not only beauty but utility will be a factor of the exhibit. Fuller particulars will be given next week.

DAIRY AT THE STATE FAIR.

Dairying at the State Fair to be held at Sacramento, August 31 to September 12th, will be given more attention than ever before. There are but few changes in the rules or the prizes, but there will be an increase in the number of entries. On butter alone there are fifteen prizes, ranging from $60 for the first, down to $9, for the fifteenth. There is no distinction between creamery or dairy butter. The butter for the contest must be packed in unmarked packages, save the shipping tag on the outside bearing the exhibitors name. Any style of package may be selected by the exhibitor, provided it contains not less than 20 lbs. It will be held and scored on September 9th and 10th.

The digestive powers of the hog are wonderful. In fact the pig is usually short-lived, hence he has not time to injure his constitution by over-eating, but he gets even by going far to encourage dyspeptic degeneration in the human family. Hence the custom is to feed hogs all they will eat of anything they will eat, and they will come very near eating anything that may be given them.

However much a cows udder may become distended, it is seldom she should be milked before calving.

Prof. Cottrell of the Kansas Experiment Station has tested the efficacy of castor oil in removing warts from cattle, and approves it, and says: "Apply castor oil well rubbed in twice daily for a week, and all will be gone, entirely cured."

Over forty per cent of the cattle in Europe are estimated to be affected with tuberculosis, while in this country the estimate is under 10 per cent, and the percentage is every year decrasing through the work of inspection and eradication being carried on by the government.

All live stock should have salt served to them regularly. The best way to do this, for cattle, horses, sheep and goats, is to have lumps of rock salt conveniently placed where the animals may approach and lick it at will. For hogs, the well known salt, ashes, lime and charcoal mixture is probably the best, and this should be accessible at all times. Animals know when they want salt better than their owners do.

"I want to aks one more question," said little Frank, as he was being put to bed. "Well?" acquiesced the tired mamma. "When holes come in stockings what becomes of thepiece of stocking that was there before the hole came?"—Clipped.

"Browning, dear," said Mrs. Emerson, of Boston, to her husband, "what is a cutaneous pastime?" "A cutaneous pastime, love? I never heard of such a thing." "Well, I heard two men on the street car talking, and one of them spoke of a skin game."—Judge.

LEWIS BRADBURY - DUARTE, CALIF.

TWO THOUSAND POUNDS A MINUTE

A. R. Coulson Tells About the New Mixing Machine and Why It Had to Be Built.

The large mixing machine recently completed is something new and it took a long time and lots of expense to make it work. This is the best mixing machine on the Pacific Coast, and it works so well that no doubt that many of the other mills will copy after it.

This electric machine will mix a ton of feed in less than a minute, more evenly and thoroughly than a man with a shovel could mix it in half a day.

Although this great machine cost nearly $1000, it will make a great saving in labor which will make up for the cost of the machine in a few months. Where it cost $1 a ton to mix feed by hand labor this machine will mix it at a cost of 25c a ton.

It was absolutely necessary to have this machine, no matter what it cost, because the trade on balanced rations for poultry and stock was increasing so fast that they could not be made fast enough with six men working by hand labor. Besides, a machine like this one mixes it more thoroughly and satisfactorily than could be accomplished otherwise.

My enterprise is bringing me success. Not only am I successful myself, but those who follow my directions and use my poultry foods are successful too.

This is shown by the ever increasing trade on my balanced rations for poultry.

C. J. McCarthy says he has made more money out of his hens since he has been feeding Coulson's food for laying hens than ever before. He is well satisfied with Coulson's balanced rations for poultry.

D. H. Ward of Cotati has been feeding Coulson's balanced rations for about a year, and has had such splendid success and made his hens pay so well that many of the other poultrymen have gone to him to find out what he feeds to make the hens do so well. Mr. Ward recommends Coulson's balanced ration for poultry.

E. D. Callon of Fallon, who has about 5000 head of poultry, has used a number of tons of Coulson's' poultry foods and recommends it to be all right.

Geo. W. Gaston of Two Rock has 2500 laying hens which are paying him well. Mr. Gaston has fed about 300 sacks of Coulson's balanced rations for poultry and recommends it to be all right.

A. M. Shread, assistant postmaster at Jacksonville, San Joaquin county, writes: After having used Coulson's balanced ration for poultry I wish to say that it is all that it is recommended to be, and that really it is the best food that one can feed, and it is quite a saving on other food stuff, as it is richer and gives better results."

D. F. Colley at Downey, Los Angeles county, when sending for another ton of Coulson's egg food for laying hens, writes: "My hens are doing well now and I think Coulson's food is what makes them lay so, and I do not want to get out of it. The hens like it and it don't take much to fill them up, as it is a richer food. It costs me 50 cents a sack freight so make the price as cheap as possible."

L. J. Howell at Hollister has used over 100 sacks of Coulson's poultry foods and his hens are laying an average of 60 per cent, that is 60 eggs a day for each 100 hens.

Miss K. L. Richardson, an enterprising young lady at Malaga, four miles from Fresno, is making her poultry venture a success. Miss Richardson has ordered over 200 sacks of Coulson's balanced rations for poultry during the last four months.

S. W. Morgan, a breeder of fancy poultry near San Diego, has a supply of Coulson's poultry foods shipped by steamer every three or four weeks.

Many of the fancy breeders in Ventura and Los Angeles county now feed Coulson's balanced rations for poultry.

Mrs. Riley at Biggs, Butte county, orders ten or twelve sacks of Coulson's egg food at a time to be sent by freight.

Many other parties in Placer county, Toulumne county and Yolo county, order a supply to be sent by freight once a month.

Cnopius & Co., Santa Rosa, write: "Please quote us your lowest price on a full carload of Coulson's balanced ration for hens." This firm has already sold over 1000 sacks of Coulson's food.

Extracts from letters:

"We are entirely out of Coulson's egg food and Coulson's chick food and our customers are howling for it. So please see that our order goes forward at once by first freight."

"Enclosed find check for $168.70 to pay for last shipment of Coulson's egg food."

"Please ship at once to Germain Seed Co. by steamer to Los Angeles, 20 bags of Coulson's balanced ration egg food. There is quite a demand for it."

W. T. Park, of West street, one of Petaluma's progressive poultrymen, proved by actual experiment that Coulson's food for hens would make hens lay and grow feathers at the same time.

He bought from a neighbor a flock of 50 hens which were all run down. Their combs were black and they were a hard looking lot. He put them in a pen by themselves and fed them Coulson's egg and feather food and in two weeks they were all growing new feathers and over half of them were laying. Mr. Park uses Coulson's food right along.

There are hundreds of others that are using Coulson's poultry foods right along and are making a success of it.

Coulson's balanced ration for poultry is now on sale at most up-to-date feed stores, or if not, you can order from factory and have it sent by freight.

Zartman & Co. are building a new advertising wagon for Mr. Coulson. It is to cost about $125 and to have a low top and the inside is to be fitted up with shelves and a door on the end so this wagon inside will look like a little store. Charles Mills will have charge of this wagon and will take a four month's trip down in the southern part of the state as far as Mexico. Another wagon similar to this will be built for the northern country.

If you are not using Coulson's balanced ration, why not give it a trial and make more profit out of your poultry. Coulson's food will be as cheap as any other good feed and it will make your poultry give you double the returns on the cost of feed.

Ask your feed dealer for Coulson's food and don't let them sell you something else which they may say is just as good, because they want to sell you something that they can make more money on.

Remember it is Coulson's that you heard so much about, it is Coulson's that gives such good results, and it is Coulson's food that you want.

Following are a few items at random as samples from my daily mail and given here to show what people think of my poultry foods:

Hollister, Cal., July 1, 1903.

A. R. Coulson. Dear Sir: Please ship to me at your earliest convenience one carload, 350 sacks, Coulson's Egg and Feather Food. R. C. GURY.

The Western Union Telegraph Co.

Salinas, July 15, 1903.

A. R. Coulson, Petaluma, Cal.—Ship to W. J. Fair, Salinas, one carload, 350 sacks, Egg and Feather Food and 25 sacks Chick Food.

CHAS. MILES.

L. S. Butler writes from Los Gatos: "I have used half a ton of Coulson's Egg and Feather Food and like it very well. Will soon want more of it."

John Lants of Sacramento writes: "I have used Coulson's and other kinds of egg food, but Coulson's is the best."

Hollister, Cal., July 11, 1903.

To Whom it May Concern:

I, the undersigned, started to feed Coulson's Egg and Feather Food to 250 chickens which were moulting. At the end of ten days I found that my egg production was increased 50 eggs and am fully satisfied with said food.

H. A. Hall.

Hollister, Cal., July 10, 1903.

To whom it may concern:

I, the undersigned, have fed Coulson's Egg and Feather Food to my flock of poultry consisting of 1000 for six months and can cheerfully recommend the feed to any one raising poultry as a cheaper feed and an egg producing feed. Signed, W. K. Goff.

Calistoga, July 11, 1903.

A. R. Coulson—Dear Sir: Enclosed find $7.75 for which please send by freight 5 sacks more of your Egg and Feather Food for moulting hens. So far I am well pleased with results. Yours respectfully,

MRS. E. BANTA.

Santa Rosa, July 13, 1903.

A. R. Coulson—Dear Sir: I write to tell you I have been using your food for about a year and am well pleased with results. I have been keeping hens for over 20 years and never had them do as well as they have since I have used your food. Yours Respectfully, G. J. CUNNINGHAM.

D H. Ward, one of the most successful poultry raisers at Cotati, has been feeding Coulson's Egg and Feather Food for 1 year and has used about 200 sacks of it. He recommends it to all parties raising poultry as it proves to be the most satisfactory and economical of all feeds. Last winter when eggs were bringing 55 cents a dozen Mr. Ward had 500 laying hens that laid an average of nearly 250 egs a day, and were fed on Coulson's Balanced Ration Egg Food.

C. N. Davis says that by feeding his hens Coulson's Egg Food for two weeks the hens have doubled the egg supply and are moulting too.

$500 IN GOLD.

Hollister, Cal., July 9, 1903.

A. R. Coulson—Dear Sir: I send you today $500 in gold by Wells Fargo Express, money collected for Coulson's Egg Food sold at Hollister. Your respectfully, CHAS. S. MILES.

Haywards, July 22, 1903.

A. R. Coulson—Dear Sir: Enclosed find check in payment for last lot of Egg Food. Please ship at once one carload, 350 sacks, Egg and Feather Food; also 1 dozen packages condition powder, 1 dozen cans Coulson's Disinfectant, 1 dozen 50c bottles of Roup Cure.

The Egg Food is selling well here. It gives good satisfaction and we have quite a demand for it. Yours Respectfully,

Kavanagh, Shuey and Gibson.

(By telegraph.) Malaga, Fresno county, July 24, 1903.

A. R. Coulson: Ship to R. Porter, Malaga, 1 car load Egg Food.

This Feed now for sale by over one hundred stores in California. If your dealer doesn't keep it, write for prices and have it sent to you by freight.

HELP NEEDED.

Do our subscribers get any help from these poultry columns? We may answer our own question by saying that this office has many assurances that Mrs. Basley's writing is of great value. It may be made much more so if our subscribers will give from their experience. Tell us something of your work. Let us know how you feed, how you cure diseases, how you kill or prevent vermin, how you raise chicks, make coops, save droppings, clean houses, construct nests, how you succeed with incubators and brooders, or anything that gives information.

Write direct to Mrs. Basley or to this office.

* * *

A BUSINESS OF SOME MAGNITUDE.

The figures of the last census of poultry and eggs in the United States are a most interesting study and show some remarkable things in regard to egg production and prices. The Agricultural Department furnishes the following, based on the figures of the last census report:

"The grand total value of the annual output of eggs is now $145,000,000, while that of poultry aggregates $139,000,000. Iowa leads the states in the production of eggs, the yearly product of that state being 100,000,000 dozen. Ohio comes next with 91,000,000 dozen, Illinois is third with 86,000,000 dozen and Missouri fourth with 85,000,000 dozen. With the exception of Alaska and Hawaii, Montana pays the highest price for eggs, the average price being 20 cents a dozen. They are cheapest in Texas, where the average price last year was 7½ cents a dozen. The average price for the 16,000,000,000 eggs which were marketed in the United States last year was 11.15 cents a dozen."

The North Atlantic Division of the United States leads in the average number of eggs per hen, also in the average value of eggs per chicken. The Southern states averaging less than one-third of the amount of eggs and that third is one-third less in value according to the census. There is a wide range of difference in egg production as well as in the price of the product, and a study of poultry conditions shows conclusively that those states which may be called the "poultry belt" where the most thoroughbreds are kept, where the poultry shows flourish, are the states which lead in the value of the product per hen. The State of Maine, one of the coldest and most unpromising for poultry production, yet leads in the average number of eggs per fowl and the value of eggs produced by each fowl.

The Southern Atlantic states make a very poor showing and the South Central no better, these averaging about one-third the average of eggs and one-half the value per hen. The Western division is next in value to the North Atlantic, whilst our own sunny California, which leads the world in fruit products, takes only the seventh place among the eleven states of the Western division. What do we learn from this? That thoroughbred poultry pays better than any others, that those states noted for Yankee energy and grit qualities, which insure good care and up-to-date methods, are the ones which lead in the value of the product in spite of the climate.

That the scrub chicken of the South, combined with the indifferent care is the cause of the low average egg production. What an argument in favor of thoroughbred fowls, as well as thoroughbred care! What a plea for renewed energy in keeping up to the standard not only in fowls, but in up-to-date methods.

It is noticeable that the states which have the government poultry experiment stations are leaders in profitable poultry keeping, and in this state we are hoping for similar improvement from the government poultry experiment station which has been appointed at Petaluma.

Commenting upon the statistics the census report says: "The population of the United States in 1890 was 62,979,766, and the egg production was 819,722,916 dozens, an average per capita production of thirteen dozens. The number of eggs per capita shown by the present census is seventeen dozens." This shows a remarkable increase (nearly twenty per cent) in average number of dozens of eggs per head of population and shows the constantly increasing demand for eggs.

* * *

WHAT A FARM WOMAN MADE WITH POULTRY LAST YEAR.

The following was taken from a paper read by Mrs. Billings at a farmers' institute:

"I have had some experience with poultry, as I have had the care of a flock of hens for the past twenty years, with good success. We keep about 200 hens. I raise from 100 to 200 chickens every year, hatching and raising them with hens. My way of caring for the chickens is this: I do not feed them anything until they are 24 to 36 hours old, and then feed them bread soaked in water for about a week. After that I take corn meal and johnnycake, and soak that and feed five times a day until they are about five weeks old; then I feed wheat screenings or whole wheat, always giving them plenty of fresh water or sweet milk to drink. In caring for them in that way the loss from sickness is very small. Sometimes the crows or hawks will catch some of them.

"My way of caring for the hens is: In the winter I feed a warm feed every morning of bran with some meat feed mixed with it, either dessicated fish or boiled beef and bone, using seven parts of bran to one of the meat feed, mixed with hot water, and feed while warm. At noon feed corn or wheat, and if they need more feed, corn again at night; always have a box with crushed oyster shells where they can get them when they want them, and give them all the fresh water they want. Two or three times a week I feed some vegetable food, cabbage or apples if we have them, or potato parings. W keep our hens shut in in the winter, unless it is very warm. Don't forget that you must have a warm, dry place for them.

"In the summer they run where they please, with the exception of the garden. They are fed every day of the year all they will eat.

"Here is what we did with our hens last year: January 1, 1901, we had 200 White Leghorn hens and 11 Plymouth Rocks for setters. We sold 1506 dozens of eggs, which brought $298.87. We have sold 17 roosters for $7.30, which makes the sales amount to $306.17. The eggs used in the family is 84 dozen; calling them worth 18 cents a dozen makes them worth $15.12. You see that the eggs sold brought almost twenty cents a dozen only lacking a fraction of a cent. The chickens used for meat are 50 at 30 cents each; this is the lowest price that we have sold any for; it makes them worth $15. January 1, 1902, we have our number of fowls that we had January 1, 1901, and 95 extra pullets worth 50 cents each, which is $47.50; and 24 extra roosters worth 40 cents each, which is $9.60—which, by adding what we have sold and used and the extra fowls, is $393.39. The cost of

ANSWERS TO CORRESPONDENTS.

Mrs McC. of Wilmington had several hens in her flock, which failed to lay; she killed them and found in each immature eggs ranging in size from a small common marble to the size of a walnut, all solidified, some black. The hens ate well and appeared otherwise perfectly healthy. What is the trouble and is there any remedy?

Ans. Your hens have what Dr. Salmon calls "gangrene of the ovary." This disease is, he says, common with all varieties of poultry. On examination of the ovary after death, the ova are found in different stages of development, but instead of being yellowish-pink in color they are brown or black, easily crushed and the contents broken down into a putrid liquid.

The cause of this trouble is not well understood. It has been attributed to the birds being too fat, thus compressing the ovary, and hindering the evolution of the ova. As it may occur in birds which are not over fat and as is evidently accompanied by the penetration and multiplication of bacteria, it is possibly an infectious disease. There is no cure for it.

Mrs. E. F. of Houston asks for the average prices of eggs, and which I consider the more profitable hens for laying or broiler raising, or is it best to combine the two?

In my opinion, egg farming is more profitable than broiler raising, but for most poultry keepers a combination of the two or combining the several branches, eggs, broilers, and roasters is the best. One may start with eggs for market as the main point. To keep up the stock for egg production, a large number of chicks must annually be raised. Probably half of the chicks will prove to be cockerels; these must be marketed either as broilers, or kept over and caponized as roasters. Or the earliest hatchers may all be sold at very good prices for broilers. I mean hatching by incubators so as to catch the winter trade.

If a person is a good poultry raiser and a rustler in business, it pays best to work along these lines and especially to get up an egg and poultry route among private customers.

The average price of eggs in Los Angeles is 25 cents per dozen.

THE INDIAN RUNNER DUCK.

The Indian runner duck is what might be called an all-around practical duck. The general make-up of these ducks seems to be unlike many others, inasmuch as they have so many points in their favor.

First, the color and plumage are very attractive, being of a fawn color mixed with white, the drakes having a steel blue cap, with a distinct white line running from the eye around the back of the head to the eye opposite, the pure white neck, the fawn-colored breast and back, tapering off with white in wing flights and tail. They are strong and erect, alert in every motion and very hardy.

Second, their laying qualities are such that they have been called and are known today as the Leghorn of the duck family. One breeder claims for one individual duck a record of 192 eggs per year.

It is very fascinating for one to collect eggs from these ducks after once starting to lay, and they generally start in with me in February. It is a common occurrence to bring in just as many eggs as there are ducks.

Third, as a market duck they grow very rapidly, and while they consume much less food in proportion than the Pekin, at 10 weeks old will dress 10 pounds to the pair, and in comparing the pair I find the runner smaller boned, but heavier meated.—American Fancier.

"I want an egg plant," said a young married woman to the grocer. "I'm sorry, but I haven't one in the store just now." "Well, I must get one somewhere, and raise my own eggs, for I am resolved not to pay such high prices for them."—New York Sun.

THE OLD LOVE.

Love calls but once, and he who hears
The music of that heavenly call
Sings but this song through all the years—
The old love is the best of all!

And though our heads be bowed with gray
And that dear love beyond recall,
We sing the good old song for aye—
The old love is the best of all!

And so, sweet love, may you and I
In heaven above this song recall—
Still singing in eternity—
The old love is the best of all!

Ave, though it be a chastening rod,
We kiss the face beneath the pall.
And mute with anguish, bless our God,
The old love is the best of all!

—[Eugene Field.

AN ARMY LASSIE'S TRIUMPH.
(Continued from last week.)

That night when the crowd was thickest in Quibb's place, she came. Her manner was a little timider than usual, and she put in her fair head, looking at the stage, before she entered. Her countenance was radiant.

When she passed among the tables she forgot to say "War Cry" any more: and the eyes of the elder Quibb, which, like an animal's, followed her every movement, drew from her's no answering glance Through the dark passage she now went, only to hover outside the gambling room, her heart beating fast. When she entered at last, Harry Quibb's life once for all did there change. The dice-box fell out of his hand and he arose. "Fellows," he said, oddly, never taking his eyes from hers, "I'm sorry to say that the game will have to stop for tonight."

Turning, they perceived her disappearing through the door. Thither strode young Quibb, after her, and disappeared, too. The culmination of her love for him having come, she was in too great a trembling to halt in the passage, but fled on into the saloon, where she encountered the indignant saloonkeeper. "Get out of this saloon!" raged he, leaning far over the bar, shaking his fist at her and speaking in such thunderous tones that the musician ceased his tumultuous pounding, and all other sounds were hushed. "Get out of this saloon, you sneaking little devil. Quibbs can get along from this night on without the Salvation Army. And if ever again," his fist came close to her face, where she shrank terrified against the wall, "you dare put your foot in here, I'll kick you out!"

And shaking the floor with his heavy tread, he rounded the end of the bar, walked to the spot where she crouched and seized her arm.

At that the silence became uproar, the resentment of the crowd having grown into anger. A dozen men sprang at Quibb and flung him off; a table was overturned; glasses went crashing to the floor, and the saloonkeeper was thrown backward against the bar.

In the subsequent momentary lull Harry Quibb was heard running up the passage. One of those who had seized the saloonkeeper now broke out as outraged spokesman for the crowd. "Shame on you! You shan't touch her. There's not a saloon in town that doesn't welcome her. What harm do they do, answer me that? The boys won't stand for it, Quibb, you beast; they won't stand for it."

The saloonkeeper's son, white, having now entered, stood strong and defiant between the girl and his father, and his eyes flashed. "Don't you dare touch her again," said he, his voice husky.

"So the cub is going to dictate, eh?" rasped Quibb; and you men, what is it to you? Ain't I master of my own place? I tell you now," here he struck the bar with his fist, "I'll keep them meddling women out of my place if I hang for it!"

With that he lunged at the girl again, so that father and son seemed on the point of grappling. But others running between averted the struggle. A light broke on Quibb. He gazed dully about and saw that the faces of all his customers looked dangerous. So he growled and went back behind the bar and glared over it, saying no more.

Now Harry Quibb turned to the girl and took her arm gently. Dazed, she went with him across the room to the door. Then he turned. "Thank you, gentlemen," said he, now bloodless and quiet, and he led her out amid cheers.

An hour later they stood by the steps of the church.

"You must never go there again," he said firmly.

"I must," she said; "at least, even if afterward I ceased. They must know that the army cannot be conquered by fear." She paused, then added: "I will go tomorrow night, I am not afraid."

This overcame him, and he said: "I love you. I want to quit my life. I want to come into yours, and I want you to come into some new one of mine. But I can't join the Army—I'm not made for that. And I don't want you to belong to it, either. I couldn't stand it. If I go half way to you, you can come half way to me. We'll move to Riverside. Come—love me—I have left the saloon and you'll leave this and come to me."

She could not answer, drooping on the steps. He cried again: "Won't you leave this dreadful life—Won't you marry me?"

She stammered that she could not be sure; she said she would see; she said she would pray over it tomorrow with her brothers and sisters of the army.

"But when can I know? I can't wait for you. Your heart's mine already, and you've got to be mine, too."

She could not keep his arms away, or stop his kiss. "I'll see," she murmured, as if the struggle made her sick. "I'll see tomorrow what I ought to do. Tomorrow night, when I come, if I wear this dress you'll know that I can't. But if I wear"—He was holding her as if never to let her go—"a gray one I used to wear before I joined the army, then you will know that I can."

"May I have the license ready in my pocket?" he asked.

"Then what if I wore this dress?" she said.

"At least," he answered, "then I could keep it to remember you by. Oh, let me have the license ready in my pocket."

"Well," she murmured, "you could have it ready."

The breeze was damp on the night of the morrow; even the dust that blew around the door of Quibb's saloon seemed sluggish, as if it knew the rain would come.

The saloon was unusually crowded that night. Now the music began its tumult, and the frayed comedienne came laughing on the stage. At the same moment the door opened and the same fair face that had appeared there every night appeared there again, pale. The maid of the Army walked in and gazed about, with appealing eyes. There fell a hush on the crowd, which looked from her to Quibb and back to her again, ready to fight for her. Only the frayed comedienne sneered; and on the morose countenance of Quibb was an impotent scowl. Then the crowd began to murmur: "She looks different." "It's her dress," said they.

She came across the floor, a slip of a thing, to prove the steadfastness of the Salvation Army. "War Cry?" she said, so low that no one could hear her. "War Cry?" and immediately her wares were nearly all sold.

Now, under the scowl of Quibb, she went into the passage. The keeper's son, fiercely throwing the dice for the last time over the green cloth, heard her soft voice behind him at the door.

"War Cry?"

He had been afraid to sit where he might see her without warning. He would not turn, being afraid still, knowing that everything depended on this sight of her. What if she wore the army gown and the picturesque hat? Again her voice was heard behind him. She could not go any further; she was not trying to sell; she did not see anything but his cheek turned away. Her tones became heart-pleading to him to look at her.

"War Cry?"

Now he could wait no more, but turned. In the midst of the gamblers she stood like a lily that will break. And her dress was gray!

He arose. "Fellows," he said dreamily, "the game is done."

Forgetting to drop the dice-box, he carried it in his hand as he and the girl walked out together. They threaded the passage and walked into the glare of the saloon. Between the eyes of the elder Quibb and the ex-

pectant faces of the crowd they moved, he holding to her arm. At the door he paused an instant and turned to meet the gaze of the spectators. She, too, turned, smiling a little.

"Gentlemen," said he, "my wife."

The glass door swung open, swung shut, and Harry Quibb and his bride were gone.—Charles Fleming Embree, in Argonaut.

LOOKING FOR FLAWS.

Don't look for flaws as you go on through life.
And even when you find them
It is wise and kind to be somewhat blind
And look for the virtue behind them.
For the cloudiest night has a hint of light
Somewhere in the shadows hiding;
It is better by far to look for a star
Than the spots on the sun abiding.

The current of life run every way
To the bosom of God's great ocean;
Don't set your force 'gainst the river's course,
And think to alter its motion.
Don't waste a curse on the universe—
Don't shrink at the trials before you;
Don't but at the storm with your puny form,
But bend and let it go oe'r you.

The world will never adjust itself
To suit your whims to the letter;
Some things must go wrong your whole life long
And the sooner you know it the better
It is folly to fight with the infinite,
And go under at last in the wrestle.
The wisest man shapes into God's plan
As the water shapes into a vessel.
—[Ella Wheeler Wilcox.

A DAUGHTER'S PLACE AT HOME.

One of the sweetest things a girl can do is to receive friends graciously, particularly at home. In one's own house a cordial manner is peculiarly fitting. Do not stand off in the middle of the room and bow coldly and formally to the friend who has called. Walk over to meet her, give her your hand and say pleasantly that you are very glad to see her again.

A daughter's part is to assist her mother on every social occasion. Apart from and more important even than her manner to a guest who drops in for an hour or a day is the manner of a daughter to her father and mother.

The father returns to his home after a weary day at business. He is tired in body and mind. Coming back, as his latchkey turns in the house door he throws off care. He is joyous at the thought of the dear ones he will meet after hours of absence.

His young daughter, in a pretty gown, with the bloom and freshness only girlhood wears, should be ready to give him the attention he loves—the kiss, the cheery word, to help her mother and the rest in letting her father see how much he is loved at home.

Men give up a great deal for their families—their time, their strength, the knowledge they have gained in life's experiences. They spend everything freely for their home's sake, and the home should pay its debt in much outspoken love.

A WORD TO BOYS.

You are made to be kind, boys—generous, magnanimous. If there is a boy in school who has a club-foot, don't let him know you ever saw it. If there is a poor boy with ragged clothes, don't talk about rags in his hearing. If there is a lame boy, assign him to some part in the game that doesn't require running. If there is a hungry one, give him part of your dinner. If there is a dull one, help him to get his lesson, if there is a bright boy be not envious of him, for if one boy is proud of his talents and another envious of them, there are two great wrongs and no more talent than before. If a larger or stronger boy has injured you, and is sorry for it, forgive him. All the school will show by their countenances how much better it is than to have a great fuss.—Horace Mann.

Dorothy—I do wish we were rich, father.

Father—How rich would you like to be?

Dorothy—Oh, awfully rich, rich enough to snub people and still be called agreeable. — San Francisco Wasp.

SAND.

I observed a locomotive, in the railroad yard, one day;
It was waiting in the roundhouse, where the locomotives stay;
It was panting for the journey, it was coaled and truly manned,
And it had a box the fireman was filling full of sand.

It appears that locomotives cannot always get a grip
On their slender iron ravement, 'cause their wheels are apt to slip;
And, when men reach a slippery spot, their tactics they command,
And to get a grip upon the rail they sprinkle it with sand.

It's about this way with travel along life's slippery track;
If your load is rather heavy and you're always slipping back,
So, if a common locomotive you completely understand,
You'll provide yourself in starting with a good supply of sand.

If your track is steep and hilly and you have a heavy grade,
And if those who've gone before you have the rails quite slippery made,
If you ever reach the summit of the upper tableland,
You'll find you'll have to do it by a liberal use of sand.

If you strike some frigid weather, and discover, to your cost,
That you're liable to slip on a heavy coat of frost,
Then some prompt, decided action will be called into demand,
And you'll slip way to the bottom if you haven't any sand.

You can get to the station that is on life's schedule seen,
If there is a fire beneath the boiler of ambition's strong machine,
And you'll reach a place called Flushtown at a rate of speed that's grand,
If for all the slippery places you've a good supply of sand. —Richmond Register.

IN THE LOWER KINGDOM.

No bird can fly backward without turning. The dragon fly, however, can accomplish this feat and outstrip any swallow.

Oysters, after they have been brought away from the sea, know by instinct the exact hour when the tide is rising and approaching their beds and so, of their own accord, open their shells to receive their food from the sea, as if they were still at home.

The tongues of the cat family are covered with recurving spines. In the common domestic cat these are small, but sufficiently well developed to give the tongue a feeling of roughness. But in the lion and tiger the spines are strong enough to enable the animal to tear away the skin of a man's hand merely by licking it.

There are several species of fish, reptiles and insects which never sleep during their stay in this world. Among fish it is now positively known that pike, salmon and goldfish never sleep at all. Also that there are several others of the fish family that never sleep more than a few minutes during a month. There are dozens of species of flies which never indulge in slumber, and from three to five species of serpents which the naturalists have never yet been able to catch napping.

HINT TO MOTHERS.

"I need a new carpet for my dining-room," commented a woman recently, "but I tell the children while they are so careless at the table the old one will do as well. It is a Wilton, worn to canvas, and on occasion the maid actually takes a scrubbing-brush to the grease spots."

"Why, do you know," replied her companion, "I bought a new one this spring on purpose to improve my children's manners while eating. They greatly admire the freshened room, and it is a matter of pride with each one as he gets down from his chair to see how few crumbs he can leave."

This is a whole sermon in itself. Children are peculiarly susceptible to the beauty or otherwise of their surroundings. They may not be able to voice it—may not be conscious of it, even, but it is none the less a potent influence on their behavior. "I used to notice," said an observing person once, "in a family which I visited quite frequently, that when my visit was confined to a chat in the library, a lovely, enobling room, full of books and sunshine, if the children were visible at all, they were exceedingly mannerly and charming, while on occasions when I would go down informally to the home luncheon or dinner, their behavior was quite different. The room was dark and sunless and the belongings good, but with all freshness worn off. I finally attributed the change in the children's conduct to their different environment."—Times.

RECIPES.

Raised Fruit Cake.—Two cups of sugar, one cup butter; all well beaten; one pint of bread sponge (light), one teaspoonful each of soda, cinnamon, cloves and one-half a nutmeg; fruit to taste; flour to make rather stiff; set in warm place to raise one hour, bake in moderate oven.

Rice and Meat.—2 cups cold boiled rice, 1 teaspoon onion juice, 1 tablespoon chopped parsley, ½ pound cold minced meat, gravy or tomato sauce. Grease a plain mould and line it throughout with the rice. Mince and season the meat, add the onion and parsley, and fill up the mould, packing it closely. Cover with more rice and steam ¾ hour. Turn out and cover completely with the gravy or tomato sauce.

Emergency Sauces.—Every woman at times is in want of a sauce quickly, and the following will often just fill the bill: Dissolve one tablespoonful of cornstarch in one-half cupful of cold water; stir this into one cupful of boiling water; add one cupful of sugar, the juice of a small lemon, a little nutmeg, and one tablespoonful of butter.

Another of this kind is made as follows: Whip one cupful of cream and one-half cupful of sifted, powdered sugar and flavor as you desire. Fresh or preserved fruits may be used if liked.

How did you come out with your lawsuit?

I won it.

Get damages?

Sure. I got almost enough to pay my lawyer.—Cleveland Plain Dealer.

They are laughing in Washington over a rebuke that a sentry of one of the departments administered recently to the Russian ambassador's coachman.

The coachman, it appears, wished to drive his master's carriage along a roadway that for some reason was barred. When the sentry refused to let the carriage pass the coachman remonstrated.

"I drive," he said, "ze Russian minister."

"I can't help it," returned the sentry.

"Let me t'rough," persisted the coachman. "My master is ze Count Cassini, ze ambassador extraordinary and minister plentipotentiary of ze czar of all ze Russias."

"Frenchy," said the sentry, "I wouldn't let you through even if your master was a free born American citizen."—Ex.

TO BE CHEERFUL.

The sovereign voluntary path to cheerfulness, if our spontaneous cheerfulness be lost, is to sit up cheerfully, to look round cheerfully, and to act and speak as if cheerfulness were already there. If such conduct doesn't make you soon feel cheerful, notning else on that occasion can. So, to feel brave, act as if we were brave, use all our will to that end, and a courage fit will very likely take the place of fear. Again, in order to feel kindly toward a person to whom we have been inimical, the only way is more or less deliberately to smile, to make sympathetic inquiries, and to force ourselves to say genial things. One hearty laugh together will bring enemies into a closer communion of heart than hours spent on both sides in inward wrestling with the mental demon of uncharitable feeling. To wrestle with a bad feeling only pins our attention on it, and keeps it still fastened to the mind, whereas if we act as if from some better feeling, the old bad feeling soon "folds its tent like an Arab and silently steals away."—Prof. James, in Scribner.

WISE FATHER.

When Mr. Rudyard Kipling was a lad he went on a sea voyage with his father, Mr. Lockwood Kipling. Soon after the vessel got under way, Mr. Kipling went below, leaving the boy on deck. Presently there was a great commotion overhead, and one of the ship's officers rushed down and banged at Mr. Kipling's door. "Mr. Kipling," he cried, "your boy has crawled out on the yard-arm, and if he lets go he'll drown!" "Yes," said Mr. Kipling, glad to know that nothing serious was the matter, "but he won't let go."—Academy.

SAMSON IRON WORKS STOCKTON CALIFORNIA

San Francisco Markets.

Dairy.

San Francisco, Aug. 6, 1903.

Butter seems to be still weaker than last week, due largely to the continuous shipments of Eastern. Strictly fancy grades of coast creamery usually command the top quotations, and seem to be hardly in sufficient quantity for the local demand, at the same time the immense storage of Eastern keep the prices hammered down.

Cheese remain steady although the supply seems slightly in excess of the demand. The receipts of butter range from 45,000 to 50,000 pounds per day. Quotations are:

BUTTER	
Creamery, extras	25½@26
Creamery, firsts	24 @25
Creamery, seconds	22 @23
Dairy, extras	22 @23
Dairy, firsts	20 @21
Store	18 @19
Eastern Creamery	23 @24
CHEESE—Per lb:	
Cal. Creamery, mild new, extra	14 @15
Cal. Creamery, mild new, choice	13½@14
Young America	14 @15½
Eastern, New York Cream	18 @19
Do, new	14½@16

Eggs and Poultry.

The choice eggs are commanding slightly higher prices than last week, and the market has advanved sufficiently to make it possible to work off some of the cheaper grades. Top figures are being commanded with receipts slightly less than last week. Quotations are:

EGGS—Per Doz.:	
Ranch, selected large	27 @28
Ranch, good to choice	25 @26
Store	20 @23
Eastern	18 @21

Two to three cars of Eastern poultry are arriving daily. Quotations are:

POULTRY—Old Roosters, per doz, \$4.50@\$5; young Roosters, \$6@8; Fryers, \$4@4.50; Broilers, large, \$3@3.50; small, \$2.50@3; Hens, \$4 @5; Ducks, per doz., old, \$3@3.50; young, \$3.50@4.50; Turkeys, nominal; Geese, per pair, \$1.25@1.50; Goslings, \$1.25@1.50; Pigeons, per doz, young, \$1.50@1.75; do, old, \$1.50.

Fruits and Vegetables.

The shipments of large quantities of fresh fruits from northern points has helped somewhat to stiffen the markets, notwithstanding the local demand is only moderate. All fruit shipments to Puget Sound country has been of necessity only of the very finest and best packed, which left a quantity of medium stock for local trade, which had the tendency to depress the market. Large supply of fresh apples with only moderate demand. Poor and wormy stock over abundant, in some instances going at buyers' prices. Figs firm. Seedless grapes more plentiful and weaker. One car load of Valencias was received Tuesday, and sold at \$2.75 and \$3.00 per box. The purchase being for export to Hawaii. Local market dull, with little interest. Quotations are:

DECIDUOUS FRUITS.—Apples, per box, common to choice, 40@80c; fancy, \$1@1.25; Crabapples, per box, 25@75c.

Peaches—Per box, 30@65c; basket, 20@35c; bulk, per ton, Freestones, \$15@20; Clingstones, \$20@25.

Pears—Per box, No. 1. Bartlett, 75c@\$1; common, 25@60c; bulk, per ton, \$20@30; other varieties, \$25@55.

Plums—Per box or crate, 25@60c; bulk, per ton, \$15@20, according to variety.

Prunes—Per box or crate, 35@60c, as to variety.

Figs—Per box, 75c@\$1.25.

Apricots—Per box, 40@60c.

Cantaloupes—Per crate, 75c@\$2.

Nutmeg Melons—Per box, 35@75c.

Watermelons—Per 100, \$5@20.

Grapes—Per box or crate: Seedless, 85@\$1.25; Black, 50@90c; Fontainbleau, 50@80c.

Nectarines—Per box or crate: Red, 40@75c; White, 40@65c.

BERRIES—Per chest: Strawberries, large varieties, \$2.50@4.50; Blackberries, \$2.50@3.50; Raspberries, \$3.50@6; Huckleberries, per lb., 8@10c.

Potatoes are in good demand, and market has been steady. Liberal exports of Salinas Burbank readily command \$1.50 with a few sales at \$1.60. Green corn is very plentiful and has a weak market. Tomatoes are in heavy receipt, and prices are favorable to the buyer. Quotations are:

VEGETABLES—Asparagus, per box, nominal; Tomatoes, per box, small, 10@20c; do, river, large box, 20@35c; Green Peppers, per box, Bell, 30@65c; Chile, 25@40c; String Beans, per lb., 2@3c; Lima Beans, per lb., 2@3c; Wax, 3@4c; Egg Plant, per box, 40@75c; Summer Squash, per box, 15@35c; Cucumbers, per box, 25@40c; Garlic, per lb., 2@3c; Green Corn, per sack, 75c@\$1.50; crate, \$1@1.75; Okra, per box, 50@75c.

ONIONS—New Silver Skins per ctl., 60@75c.

POTATOES—New Whites, per box, \$1.15@1.75; per sack, 90c@1.50; Early Rose, per ctl., 75c@\$1; Garnet Chile, per ctl., \$1@1.15; Sweet Potatoes, per lb., 2½@3c.

Dried Fruits, Nuts, Etc.

Little interest is shown in Dried Fruits and the business in progress is confined mostly to job-lot transactions. In new Fruits buyers are still indifferent and local brokers are reporting an easier tone to the markets for both Apricots and Prunes, although they are not quoting out any lower prices. Both comb and extracted Honey are now arriving in liberal quantities and prices are less firm and are quoted at a slight decline.

DRIED FRUITS—Prices for carload lots f. o. b. at California common shipping points, in bags, for 1902 crop, are, per lb., as follows:

Apples—Evaporated, 4@6½c; Sun Dried, 3@4c.

Apricots—Royal, choice to fancy, new, 6¾@8c; old, 6½@7c; Moorparks, choice, nominal.

Peaches—4¼@6½c.

Pears—4¾@9½c.

Plums—Pitted, 4½@6c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 2¼@2½c, with ½@1c premium for large sizes; new crop, 2¾@3c.

Nectarines—Whites, 4@5½c.

Figs—White, 5½@6c; Black, 5c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1902 crop: Loose Muscatels, 50-lb boxes, per lb., 2-crown, 5½c; 3-crown, 5¾c; 4-crown, 6c; Seedless, loose Muscatels, 5c; London Layers, 20-lb boxes, per box, 2-crown, \$1.40; 3-crown, \$1.50; fancy clusters, 4-crown, \$2; Dehesa, 5-crown, \$2.50; Imperials, 6-crown, \$3. These prices are subject to change without notice. Seeded, f. o. b. at Fresno, per lb.: Fancy, 16 7¾c; 12 oz., 6¼c; bulk, 7½c; choice, 16 oz., 7½c; 12 oz., 6c; bulk, 7¼c.

NUTS.—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Pecans, 11@12c; Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c; Chestnuts, Italian, nominal.

HONEY—New Comb, per lb., White, 14½@15c; Light Amber, 13½c; Extracted Water White, 6½c; Light Amber, 6c; Dark Amber, nominal.

BEESWAX—Per lb., 32c.

Live Stock.

There has been no change in the live stock market other than hogs are slightly off. There are liberal stocks on hand and the market is lively.

Quotations are:

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 7@7½c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@8½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES.—Light, per lb., 5@5½c, gross weight; heavy, 4½@4¾c, gross weight.

SHEEP—Per lb.: Fat Wethers, No. 1, 4@4¼c, gross weight; Ewes, No. 1, 3¾@4c, gross weight.

LAMBS—Spring Lambs, \$2.50@3 per head or 4½@5c per lb. live weight.

HOGS—Per lb.: Hard grain fed, weighing alive 140 lbs and over, 6@6¼c; weighing under 130 lbs, 5¾@6c; weighing 260 to 350 lbs, 5½@6c; rough heavy, 4½@5c.

Hay and Feed Stuffs.

HAY—Prices on new Hay, per ton: Wheat, \$11@14; Wheat and Oat, \$10.50@12.50; Oat, \$8.50@12.50; Barley, \$8.50@11; Clover, \$8@10; Alfalfa, \$9@10.50; Stock, \$8@9.

falfa, \$9@10.50; Stock, \$8@9.

STRAW—Good to choice, per bale, 45@60c.

FEED CORN MEAL—Choice grades, per ton, \$32.50@33.50.

GROUND BARLEY—Per ton, \$22.50@23.50.

MIDDLINGS—Per ton, \$27@30.

BRAN—Per ton, \$24.50@25.50.

RICE MEAL—Mill price, \$18 per ton.

CRACKED CORN—Choice quality, per ton, \$33@34.

COCOANUT CAKE—Best quality: In lots of 10 tons and upward, \$20 per ton; 5 tons, \$20.50; small quantities, \$21.

BEANS—Prices per ctl.: Large Whites, \$3@3.15; small do, \$3.15@3.30; Pea, \$3.25@3.50; Lima, \$3.45@3.60; Red, \$2.90@3; Pink, \$3@3.10; Bayo, \$3.65@3.75; Blackeyes, \$2.75@3; Red Kidneys, nominal.

Cereals.

WHEAT—New crop: No. 1 shipping, per ctl, \$1.41¼@1.42½; choice, \$1.43@1.45; White Milling, good to choice, \$1.50@1.60.

BARLEY—New crop: Choice, No. 1 Feed, \$1.05@1.08¾; Shipping, \$1.12½@1.20; Brewing, No. 1, \$1.16¼@1.22½; Chevalier, nominal.

OATS—Feed, good to choice White, \$1.22½@\$1.32½; White Milling, \$1.32½@1.37; Red, \$1.15@1.27½; Black, \$1.12½@1.20.

RYE—Good to choice, per ctl., \$1.10@1.15.

CORN—Good to choice, per ctl.: California, new large Yellow, \$1.50@1.55; small do, \$1.70@\$1.75; White, \$1.50@1.55.

Hops.

The prices for new crop are 18 @20c per lb, according to quality.

Eastern Markets.

New York General Market.

CHICAGO, Aug. 5.—There was a firm opening in wheat, due to the higher cables and the continued rain throughout the Northwest, September being ¼ to ⅝ higher, at 80⅝@81; All the outside markets were strong early in the day, and this was a bull factor here during the first few minutes of trading and helped to hold prices temporary, but so much long wheat came out on the advance that the prices began to decline steadily. The Northwest markets, which had been strong early, had quite a severe decline later in the day on predictions of more favorable weather for that section of the country, and this fact aided in the down turn. Extreme weakness prevailed the latter part of the day and September declined to 79⅝, closing at 79⅝@79½, a net loss of ⅞ to 1. Trading in corn was rather quiet, and governed largely by the action of wheat. Favorable weather for the crop restrained the bulls, and small ones held the bears in check. Illinois report, making the condition of the crop 73 August 1 against 78 last month, had a strengthening influence, but the weakness in wheat overbalanced all other factors. The close was weak with September ⅛ to ¼ lower, at 52⅛.

Cash quotations were as follows: Flour was steady; No. 2 spring wheat, 81@82; No. 3, 76@80; No. 2 red, 78⅛@79¾; No. 2 corn, 51¾@52¼; No. 2 yellow, 52¾; No. 2 oats, 33⅝@35¼; No. 2 white, 34¼; No. 3 white, 34½@35½; No. 2 rye, 50½@51; No. 1 flax seed, 93.

Grain Movements.

Articles	Receipts.	Shipments.
Flour, barrels	33,300	26,800
Wheat, bushels	285,200	3,900
Corn, "	248,900	294,900
Oats, "	14,400	100,400
Rye, "	13,200	......
Barley, "	13,200	2,700

On the Produce Exchange today the butter market was steady; creamery, 14@18½; dairy, 12½@17; eggs, steadier at mark, cases included, 11@13; cheese, steady, 10¾@12.

Chicago Live Stock.

CHICAGO, Aug. 5.—Cattle—Receipts, 26,000, including 500 westerns; ;market slow; good to prime steers, 5.10@5.50; poor to medium, 3.75@4.90; stockers and feeders, 2.50@4.30; cows, 1.50@4.50; heifers, 2.00@4.60; canners, 1.50@2.75; bulls, 2@4.25; calves, 2.50@6.65; Texas fed steers, 3.50@4.75. Hogs—Receipts today, 25,000; tomorrow, 25,000; left over, 1800; market strong; mixed and butchers', 4.90@5.60; good to choice heavy, 5.25@5.50; rough heavy, 4.60@5.20; light, 5.35@5.75; bulk of sales, 5.15@5.40. Sheep—Receipts, 18,000; lambs steady; good to choice wethers, 3.60@4.00; fair to choice mixed, 2.75@3.50; western

sheep, 3.00@4.00; native lambs, 3.25@6.25; western lambs, 4.00@5.90.

California Dried Fruits.

NEW YORK, Aug. 5.—The market for evaporated apples continues quiet and steady; common are quoted at 4@5½; prime, 5¾@6; choice, 6½@6¾, and fancy, 6¾@7½: Prunes attract fair jobbing demand, and rule steady to firm with the larger sizes showing a somewhat harening tendency, though prices still range from 3@7 for all grades. Apricots are firm on spot with some demand reported for future shipment. Choice are quoted at 8@8¾ and fancy at 10@12. Peaches rule steady and quiet, with choice quoted at 7@7½, and fancy at 8@10½.

ST. LOUIS WOOL MARKETS.

ST. LOUIS, Aug. 5.—Wool unchanged, firm; Territory and western mediums, 16½@18½; fine medium, 14½@16; fine, 13½@16.

MARKET NOTES.

Three hundred tons of alfalfa were recently bought in Riverside county to be shipped to Los Angeles. The price paid was $10.50 net to the growers at Riverside.

Local butter market about the same as last week, with the exception of heavy increase of eastern cold storage. There is now over one million pounds being held here, as against 700,000 pounds last year.

Wheat seems to be strengthening in the market and the wheat farmer has promise of a big year. Local prices are eminently satisfactory at present.

CITRUS MARKETS

ORANGE MARKET.

The market the past week has been quiet but steady, cool weather no doubt assisting in handling the rather heavy receipts of oranges. The markets are amply supplied by liberal shipments that went out week before last. Auctions have maintained a firm front, and for a few extra fancy goods paid high prices. Indications are for a continuation of the present conditions if arrivals continue moderate. Western markets are quiet and somewhat easier on Valencias. Good cars of seedlings or sweets bring fair prices but these are scarce.

LEMON MARKET.

Lemon prices have gone from bad to worse, New York sales of foreigns showing a steadly decline, with weak fruit selling at very low prices. Western markets are overstocked with Californias and the Central states markets with foreigns, and there is nothing encouraging in sight at the present time. Some points have shown nigh temperatures but nothing sufficiently steady in this line effect lemon sales materially. The average shipments of lemons last week were 66 2-3 per cent of the week previous.

CITRUS FRUIT SHIPMENTS

Shipments of citrus fruits from Southern California for the season, from November 1, 1902, to date, are 21,269 carloads, of which number 240-4 carloads are lemons.

AUCTION SALES.

NEW YORK, July 29.

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

BLOODY MILK.

Dr. Fenimore: I have a young cow which has been giving bloody milk out of one teat for two or three weeks. Have given her several doses of nitrate of potash to no purpose. Has been giving milk four months. We feed hay, bran and green alfalfa, also green sorghum.—W. C. Bullard, Chino.

This condition may exist from a number of causes. If the food is two rich and abundant it must be reduced. If caused from acrid plant, they must be removed. If congested or inflamed from an injury, loosen the bowels and follow with ½ ounce of potash with 1 dram of chlorate of potash once a day. Bathe the udder with hot water and rub with camphorated lard . Milk carefully.

* * *

ECZEMA.

Editor Cultivator: I have a horse which has been troubled for several months with some itching skin disease; the hair comes out in spots, and he is very nervous, keeps biting himself.—Subscriber, Alliance.

Give an aloes ball composed of Barbadoes aloes 1 oz., nux vomica, belladona and ginger, each 1 dram. After that has acted mix eight ounces each of potassium, nitrate of hyposulphite of soda and give one tablespoonful in the feed three times a day. Keep the itchy places well shampooed with creoline.

* * *

EMACIATION.

Dr. Fenimore: I have a horse very poor, has been so for six months. Has been doing light work and has plenty of good feed and fresh water, but will not gain in strength or flesh. After removing the harness he strikes his sides with his teeth.—Subscriber, Santa Rosa.

Description not sufficient to make a diagnosis.

WANTED—An Experienced Manager for large walnut orchard. Must be single and have good references. Must be an experienced irrigator and orchardist Salary, $75 per month and board. Address "WALNUT," this office.

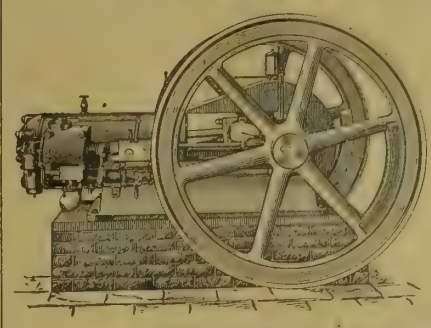
Los Angeles, Cal., June 30, 1903.

The following named children have been received in the Boys' and Girls' Aid Society Home since April 1st.

Half orphans: William Higgins, male, aged 11 years, light hair, blue eyes; Harry Higgins, male, aged 10 years, light hair, blue eyes; Rowland Higgins, male, aged 8 years, light hair, blue eyes; Harry Higgins, male, aged 6 years, light hair, blue eyes; Ruby Higgins, female, aged 4 years, light hair, blue eyes; Peppa Bailey, female, aged 3 years, black eyes, dark hair; Roberto Bailey, male, aged 4 years, dark hair, black eyes; Gertrude Chapman, female, aged 6 years, dark hair, black eyes; Chester Garwood, male, aged 9 years, light hair, blue eyes; George Garwood, male, aged 11 years, light hair, blue eyes.

MRS. E. A. CHRISTIAN, Supt

"Western Engines"



Made at home of finest material and by best of workmen. Adapted to California conditions. More work with less fuel and less trouble than any other engine, at as low a price, guaranteed.

We also handle the famous OTTO gas and gasoline engines. And for light power (3 H. P.), the "Stickney, Jr." It's a beauty and works like a charm.

LARGER CROPS - - SMOOTHER FRUIT

Smoother Fruit MEANS Smoother Prices

That's why our friends who have used it voluntarily, write in and say:
"It's my intention to use only your goods this year"
"This is a very satisfactory result"
"I have used it exclusively with satisfactory results"
"I am well pleased with your fertilizer"
And a stack of others as good or better. Send for pamphlet

West Coast Fertilizer Works

73 Bryson Block, Los Angeles, Cal.

Bituminized Fibre Pipe

(PATENTED)

For Irrigation Systems

Our Pipe has IMPORTANT ADVANTAGES over Iron, Wood, Vitrified or Cement Pipe

Will not rust or decay.
Strong and tough, not easily broken.
Non-Porous—impervious to Roots and Moisture.
Made in 7-foot lengths, giving comparatively few joints.
Its comparative light weight makes low freight bills.
Easily and cheaply laid.

WRITE FOR PRICES AND NEW CATALOGUE.

. . . PRODUCTION OF GRAIN . . .

Of the 99,827,200 acres of land included with the boundaries of the state of California, there are only 28,828,951 used in farming. This is 28.9 per cent of our total area. More is being reclaimed from the desert each year, and some of the back valleys of the mountain ranges are being given outlets so that their fruit, and cereals may reach the market so that the increase in number of farms has been regular and constant since 1860. The increase during the past decade was 37.1 per cent. This increase does not include the large cattle ranges.

The impression has prevailed that cereal production for the past few years has declined, giving way to the more profitable and more popular fruit production, that is, in sections where the soil and water justifies the farmer

Prince Harvester, owned by Warren Fowler, Lodi.

entering into the production of fruit. This impression is shown by statistics to be erroneous, for notwithstanding the great increase in fruit production, the extension of the agricultural fields has kept pace, and when there has been sufficient rainfall the average of years ago has been maintained.

This must have called for a vast extension of acreage, because it is well known that the production per acre has lowered the average. As noted the one great factor which controls the cereal product is the rain fall, as may be seen from the following figures. The season of '80 there were 26½ inches of rainfall at San Francisco, the production of wheat that year was 34,150,000 centals; in '82 the rainfall was 16 inches, production 21,000,000 centals; '88 rainfall was 16 inches, production 18,643,000, '89 the rainfall was 32 inches, production 25,000,000 centals; '98-9 when the rainfall ranged from 4.99 inches to 12.91 inches in the wheat section, the wheat product was reduced to 6,741,420 centals. Last year that was nearly trebled by the rainfall being less than double that of the preceeding year.

The total acreage devoted to the production of all cereals in '99 was 2,984,036 acres, as against 2,561,800 acres in 1879. The largest average yield is found along the San Joaquin and Sacramento rivers. San Joaquin reports more barley, rye and wheat than any other county. Sutter County more buckwheat, and Sonoma more corn and oats.

While the yield per acre was declining during the years which the great valley has been producing grain almost exclusively, the labor cost per cental has been reduced to less than one third what it was. Then the methods of plowing and preparing the ground and of sowing the grain were all very crude as compared with present methods.

To furnish seed, plow, sow, harrow, and bring the grain ready for the harvest, the cost does not exceed $3 per acre. With the combined harvester $2 per acre will cut, thrash, clean, and sack all at one operation, this includes the cost of sacks. Of course, these figures contemplate the farming in great fields, sometimes miles in extent, where the possibilities for the most economic handling prevail. The production of this machinery has given rise to some of the largest of California's manufactures, and many farm machines are produced here in greater perfection than in any other section of the world. We recently mentioned in these columns a new feature brought out by the Samson Iron Works of Stockton. It is simply the adaptation of the gasoline engine to running the harvester of the combined machine. Heretofore these machines were drawn by about thirty horses, and the motion conveyed to the threshing machine by the friction of the broad

Houser-Haines Harvester, owned by Wm. Journey, New Hope, Cal.

wheels upon the ground. This is still the case, of course, with many machines, but the objection of so many horses being required, coupled with the uneven motion given the cylinder, especially at turns of the corner, etc. resulted in unsatisfactory results. The Samson people introduced the idea of pressing a distillate gas engine into use, and driving the cutting and threshing machinery by it. The horsepower to propel the machine is reduced to about one half, that is, instead of thirty-two horses from fourteen to eighteen now do the work. The uniform motion given to the thresher gives far better results in cleaning and threshing of the grain. We give on this page three photos of different machines, which have been fitted with this convenience, and we are informed that the work is eminently satisfactory to the owners.

The firm, which manufactures this new appliance has only been in operation for about three years, but the growth of the business has been such that only recently it moved into its new quarters occupying three acres of ground in Stockton, and today is keeping a large number of people constantly busy manufacturing gasoline and oil engines, pumping plants and other farm machinery. The crude oil generator which they attach to all their engines from 1½ to 75 horse power works to perfection, and is the most economical of plants,

Prince Harvester, owned by Jacob Brack, Lodi.

Combined Harvesters and Threshers, Each Fitted With Samson Distillate Oil Engine, and Each Capable of Cutting 50 Acres per Day.

. . . FARM ORGANIZATIONS . . .

The following extracts are from a paper by Prof. C. B. Sumner of Claremont, read at the Seaside Institute.

Organization is union—in union is strength. The stronger the units bound together the stronger the resultant. Cotton and hemp strands woven together make a strong rope. Wire strands woven together make a cable of far greater strength than the rope of hemp or cotton. Our farmers and horticulturists are strong in themselves. They include men of large ability and culture. Many of them are prosperous. Bind all together and they become a mighty power in this state:—I may almost say the mighty power. Indeed, let them act as a unit and they are irresistible—* * *

Why should we farmers organize?

I. For the purposes of economy. We are farming, I take it, for what there is in it. Whatever else we seek and find, we want profit—the largest possible margin. This means economy of expenditure all along the line.

(1) First, economy in production. We all know something of the advantages of wholesaling. The advantages are just as great on the farm as anywhere else. Wholesale farming in the west has driven the New England farmers to the wall. * * *

(2) What is true of production is true of handling. The best fruits, vegetables, hay and grain may be so handled as to lessen, even destroy their value.

It was my good fortune recently to go through and examine the methods of handling and the fruit handled on the Limoneira ranch, and I am satisfied that Southern California has lost thousands and thousands of dollars by poorly handling lemons. * * *

What may be ruinous for one man to do alone, may be highly profitable to a number with mutual interests combined together, with that end in view. Scientific gathering, and handling, and scientific machinery are no less a necessity than good fruits. All are necessary to profit.

(3) We are slowly learning something about transportation. Our transportation companies are powerful. They are combined. We must meet them by combination or we are lost. You know what the reduction of twenty-five cents per box on the transportation of lemons meant to us a part of last year. Had it not been for the Southern California Fruit Exchange who of us would have expected to receive it by our personal solicitation? * * *

No sane man looking at the interests of our farmers will think of meeting the great future before us without fuller and closer organization in this matter of transportation.

(4) Perhaps there is less general information about marketing than any other branch of our business. A very little study of the different markets, and possible markets, and of auction sales, and conversation with wholesale dealers will convince anyone that we have to do with a shrewd set of men, and we must be on the alert to cope with combination of dealers and importers, even if we have no competition from our own home field. * * * *

More and more are influences felt in our markets from all over the world. We must meet combinations against us. Knowledge must stand against knowledge, business ability against business ability. Organization is just as necessary for business purposes as for governments. It is necessary in peace and in war.

II. We have occasion to organize not only for the sake of economy, but also for purposes of legislation.

Let us not shut our eyes to the facts. Our experience with a fertilizer law, and with the tariff, if nothing else, demonstrates the necessity of careful and close organization in order to further and protect our interests. The veriest tyro in fruit raising knows something of the work of the Southern California Fruit Exchange in the legislative halls at Washington. There Greek meets Greek. Important industries must be watched in order to secure even-handed justice. Hardly an industry but has its representatives at court, at the opportune time, and they are not all scrupulous about the other man's interests. We need the tariff, and we must watch to keep it. * * * * * *

Would our government, think you, have entered the arena of irrigation legislation, had not organized effort year after year kept the matter before the minds of our legislators?

In our own state as well, legislation is an important factor. What proportion of the taxes should our farmers pay? What is the equitable assessment? Should co-operation be made easy or difficult? Are there few spheres or many in which co-operation may work for our interests as well as

NATIONAL IRRIGATION CONGRESS

The National Irrigation Congress to convene September 15 to 18 at Ogden promises to be one of the most strenuous sessions that organization has ever held. The ten millions appropriated by the last Congress makes vast improvements possible in a few sections of the arid West. What sections are to be favored by a slice of this appropriation may largely be determined in this convention.

The convention will be attended by leading irrigation experts, representatives of agricultural institutions, state engineers, noted foresters, fruit growers, farmers, and business men. California should have a full quota of delegates. The basis of representation is so liberal that every section of this state may have delegates if it will attend to regularly appoint them.

Full particulars may be had by addressing the Eleventh National Irrigation Congress, Ogden.

INDEED!

The absurdly so-called "National" Irrigation Congress (really a cabal of far western people interested in the arid lands) is to be held this year at Ogden, Utah, Sept. 15 to 18.—Country Gentleman, Aug. 6.

Really, now, that is refreshing. The word "National" applies only to a 6x9 section on the bank of the Hudson, immediately surrounding Albany. Therein lies all patriotism, and the rest of the country should not be permitted to gather in "National" conventions. If they do they should immediately be dubbed a "cabal of far western people" and the government should call out troops and return them to their reservation.

The Country Gentleman should travel a little and widen its horizon. The Adirondacks and Catskills are serious obstacles to a good view from Albany, but if the "Gentleman" would climb a hill some morning, take a look westward, he would get a view which would jar him.

The world do move—westward—and ultimately annexation of the arid west may make us a part of the nation.

EDITORIAL NOTES.

The national beemen are to meet in Los Angeles next week. They anticipate a formation of a National Co-operative Market scheme, by which it is hoped better distribution and better prices may be secured for their product. It is now reported that a special train is on its way from Chicago with over 500 delegates from all parts of the country. There are in California over 3,000 beemen who have organized and are handling their output far more successfully than formerly under the hit-or-miss plan of marketing.

* * *

The recent experiments by the Santa Fe railroad people, in which they shipped green lemons direct to Chicago, and kept them in cold storage for several months, has not proved the success that was hoped for it. The idea was to see if the fruit would not have better keeping qualities than if held in California, and then packed and shipped when thoroughly cured. The weak point in the plan was when it was removed from cold storage, and it showed very poor keeping quality.

* * *

The great Southwest which is usually considered the arid section of America does not seem to be the only one that realizes the benefits of irrigation. Recent dispatches state that government engineers are surveying along the south fork of the Walla Walla river. By later information it seems that a large scheme is under way for the construction of a huge dam across the canyon. If completed on present lines it will back the water a distance of five miles into the mountains. A valley thirty miles in diameter will be irrigated with the water thus impounded.

* * *

The expectation is for the greatest crowd that ever entered the state at one time, to be here next week. The crowd of course will be largely made up of the old veteran who is coming to attend the annual encampment of the Grand Army. Others will be drawn who come to make this their permanent home; still others for pleasure only. Great preparations are made to receive all the visitors, not only in San Francisco, where the sessions are to be held, but in nearly all other sections of the state. Los Angeles is storing up large quantities of watermelons and things, with which they hope to impress the visitors with the hospitality of that section. O course San Francisco will do things in her usually magnificent way. We all say welcome to the old soldiers.

* * *

The light crop of apricots this year is said to be nature s protest" against the enormous crop which the trees were compelled to bear last year. Last year the crop was such an immense one that many trees bore such small fruit, no thinning having been done, that the fruit was of no value and the trees were seriously injured. It is well known that the maturing of the pit requires a great amount of potash, and it is a great drain upon the trees, yet many growers pay no attention to thinning; if the fruit is large enough, good, if it is not, fruit production is cursed, and the growers lose what might otherwise have been profitable to them. That was the result the first year, now the light crop of this year continues the loss. Moral: See that the thinning process is used to protect the trees every year, and a uniform crop will prevail.

* * *

The orange growers of Covina have been seriously discussing the advisability of destroying all cull oranges at home, rather than sell to the "Dagoes" who haul the cull fruit to Los Angeles, and sell it at a price which prevents good fruit from entering that market, at the same time giving growers almost nothing as returns from their fruit. The fruit peddlers are the only ones who have the benefits of these sales. We believe this discussion should lead to the general discontinuance of such practice. It is possible that each packing house may save a few dollars instead of having the work to dispose of the unsalable fruit. But they sell it to the Dagoes for a few cents, it has largely destroyed the sale of better fruit, for as a matter of fact, the purchasers of culls in Los Angeles pay almost as much as they would have to pay for better grade fruit. It is claimed over 300 carloads of this grade of fruit are sold in Los Angeles every year. While the number of cars of good fruit absorbed by the same market can be counted on the fingers of one hand.

FOR BETTER WORK.

A movement is now on foot which will help very materially in making the Farmers' Institutes more valuable to all who participate in the meetings.

The U. S. Department of Agriculture has created a Farmers' Institute department, and John Hamilton, the specialist in charge, is collecting information as to the life and work of all the speakers in Institutes, with a view of furnishing special information to them that they may in turn give it to the farmers.

The idea of the Farmers' Institutes seems to be steadily gaining ground all over the country. The old notion that "book farming" was of no practical value, is giving way, and now the average tiller of the soil welcomes every idea from scientific workers that may help him in his labors.

Never before were there such great problems to be solved by the farmer, and the government can do no better service for all the people than to help solve them. At the present time as well as in the past, the government has done everything in its power to help the manufacturer. Not only has it protected the home market, but it has helped in exploiting foreign fields of trade. So great has been the solicitude for our "infant industries" that foreign countries are now retaliating by placing embargoes on our products, principally those from the farm.

The Farmers' Clubs can do for the rural population what the business men's clubs and boards of trade have done for manufacturing interests. Without going into partisianism they can demand and secure protection to farm products, they can secure greater help from the government consuls in exploiting new markets for their grain, fruit and stock. They can secure appropriations to pay scientists to help them in their combats with insect pests and they can themselves by meeting together find better methods of marketing and co-operating in a hundred ways.

The government now appropriates hundreds of millions annually for the army and navy, and to agriculture, (on which everything depends and in which half the wealth of the country is invested) only six millions are given.

Farmers' Clubs and Institutes can do a great work when they once become thoroughly organized.

SIGN YOUR NAME.

The "Cultivator" is in receipt of the following, which from the postmark on the envelope, we see is from Inglewood.

"Will the 'Cultivator' kndly enlighten a newcomer regarding the care of blackberries and grapes?"—A Subscriber.

It is a rule of the Cultivator as it is with all papers, to answer to the best of its ability, all letters directly or through its columns which come from subscribers, providing the name of the subscriber is attached. This fact was noted in last week's issue in Mr. Braunton's department. The rule is so invariable, that as a mere matter of courtesy at least, we ask our subscribers to sign up. Anyone who prefers his name withheld will have the request strictly adhered to.

In this particular case "Subscriber" asks a question which if answered would take several pages of the size of the "Cultivator" to be comprehensive.

Mr. Mills has had many pages on the grape question, as to their varieties, the manner of planting, pruning, budding, and grafting, wine grapes, raisin grapes, arbor grapes, also on the blackberry. To repeat all these would be too much, yet if our subcriber to whom we would write this if we had his name, would be more explicit in this question, we could help him greatly. This is strictly the business of the "Cultivator" to give our subscribers the stuff they wish, and we appreciate these requests when they are stated so carefully that we may determine what the subscriber wants.

Sign your name, then read the letter over carefully, and ask yourself, if you were absolutely ignorant of the wishes of the writer, can you determine what is wanted.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

UNFAIR CRITICISM.

The Fullerton News two weeks ago contained an editorial upon the fruit marketing question that is about the most ill-considered utterance put out upon this subject for some time—and there have been many expressions of unfair criticism of co-operative methods in the press since the California Fruit Exchange and the Citrus Union joined in one marketing agency. It is difficult to convey the animus of an article under consideration without extensive quotation, which space will not permit in the crowded columns of the Cultivator. Briefly, the News holds the fruit agency responsible for the low prices received for fruit; asks if the grower is getting a fair deal under the present system of marketing; likens the Citrus Union to the Standard Oil Company; charges that the agency is not competent to exploit the markets, and claims to be still seeking light and hopes, possibly, to get it. Perhaps the Cultivator can aid the News in the matter of the light which all will agree it needs upon this important topic.

Let us first admonish the News that there is no safer policy for it to follow than one adopted by an overwhelming majority of the business men who are running citrus fruit farms in Southern California. These men have fought out and settled every proposition advanced, or, rather, resurrected by the News.

"Red ink sales," so freely bandied about by the Fullerton paper, had been staring exchange, individual shipper and dealer in the face a month before the consolidation into one agency was thought of. In fact, it was the awful condition of the February and March markets that caused the wise leaders in the business of selling oranges to get together in an effort to stem a general calamity. Could we by any occult means see the condition that would have followed a continuation of the policies in vogue on the first of March, no one would have the hardihood to compare the results of the balance of the season with results obtained by the fruit agency. It would be as calamity to partial failure.

The worst feature of the News editorial is that in which it charges the fruit agency with failures that are clearly chargeable to the bad condition of the fruit. This can be controverted by one simple statement of fact, namely, that good, sound fruit arriving in market in condition to keep while retailing brought good prices through the agency the entire season.

Strange that fair-minded men fail to recognize facts, and proceed to distort the public mind without a business-like suggestion for something better. Bear in mind that the News article is wholly critical, and offers no substitute for the present order of things. The Fullerton paper asks if the growers are getting a fair deal under the present plan of marketing fruit. This insinuation is met by the statement that if the News holds that poor, decaying fruit can be sold for sound fruit prices by the agency, then the growers did not get a fair deal. If fruit little better than culls in carrying quantities can be sold for prime fruit, then there is no perishable feature involved, and there is no use of producing anything but bad fruit. The public is anxiously awaiting the evolution of a scheme through which worthless goods can be raised by some hocus-pocus to valuable products. We await the News in its creative powers.

Our contemporary was peculiarly unhappy in likening the Citrus Union or the Fruit Agency to the Standard Oil Company in its operations. No one is compelled to do business with either the union or the exchange, neither by circumstances nor through the aims of these institutions. Neither has anything to do with the production of the commodity which they sell. The Standard Oil Company will not permit any other company to produce oil if it can prevent it. No limitations are set upon the production of oranges by the union or the exchange, but they do offer to

sell the fruit to the best possible advantage to all. As the growers had tried to do the selling act individually until general bankruptcy was staring them in the face, criticism comes with ill grace from anyone who has the interest of the industry at heart. Especialy is fault-finding reprehensible from a community which persisted in ignoring the exchange through all its years of struggles for a foothold in the business of doing what the growers could not do for themselves.

The article says that the combine officers have not and never will endeavor to create a demand or open up new territory. Was there ever a more outrageous statement? The agency has established a great system of drumming up the fruit trade. It is doing more every week of the season to open up new territory than the commission merchants did in a year while they held the whip hand over the growers.

The entire article is devoid of depth and fairness and must have been suggested by some one who is egotistical enough to hold that co-operation is not as effective as individual effort—an idea at variance with everything but silurian practice in this age of the world.

It is also devoid of anything like helpful suggestion, and is a cold-water-pourer only. But the intelligent growers will not follow the false prophets whose advice tends inevitably toward the chaos of commission dealing. According to the doctrine of the News and "a prominent grower," it is safer to deal with a commission man two or three thousand miles away than to deal with a firm of well-known fruit packers at home, which has its thousands invested in packing facilities right in his own neighborhood. The eastern commission man has no property investments here or elsewhere. Will you return to his fold? Not if past experience is consulted.

CLIMATE AND CROP REPORT.

Condensed from the weekly Bulletin issued by California Section of the Climate and Crop Service, in charge of Alexander McAdie.

Sacramento Valley.—Cool weather prevailed during the first of the week, followed by high temperature in the latter part. Grain harvest is nearly completed and the crop is being shipped. The yield of wheat is below average. A fair crop of barley. Hops have improved in the past two weeks, and in the Wheatland district will be an average crop; picking commenced on the 12th. Grape picking has commenced in some places. Fruit drying and canning are progressing. Orange trees are putting on new growth and the crop looks well.

Coast and Bay Sections.—Cool, foggy weather prevailed in the coast districts. Sugar beets, beans and corn are doing well. Hops are not in very satisfactory condition and will probably be below average. Grapes are commencing to ripen in some sections. Nearly all deciduous fruits are yielding large crops, excellent in quality.

San Joaquin Valley.—Clear, warm weather prevailed and was very beneficial to the fruit crop. Heavy shipments of green fruit continue to eastern markets. Grapes have made fine progress and are commencing to ripen. Citrus fruit is making excellent growth. Honey will be about three-fourths crop. Alfalfa hay is plentiful. Stock of all kinds healthy.

Southern California.—Weather conditions were about normal and favorable for crops; the fogs in the coast districts were beneficial to beets and beans. Grain harvest is completed in some sections. Wheat, barley, oats and hay are excellent crops. Sugar beets at Anaheim are reported light, but there is a heavy crop in the Santa Maria district. The bean crop will probably be less than usual owing partly to smaller acreage. Citrus fruits are in good condition. Walnuts have been injured by blight and the crop will be short.

Eureka Summary.—Much grain cut along the coast but the weather is not favorable for harvest; warm in the interior. Hay baling is progressing rapidly. Vegetables average the same as last year. The fruit crop is unusually heavy.

Coast News and Notes

By R. A. Dague, 1045 Regent St., Alameda

Petaluma is shipping about 60,000 dozens of eggs per week.

Inyo county reports one-half of the apricot output of last year.

The Home Telephone Company are going to take the Fresno field.

Corning is erecting a fruit evaporator of 20,000 pounds capacity.

The growers about Los Gatos are talking of a large co-operative store.

The "Petaluma Poultry Journal" is giving a department to the Belgian Hare industry.

Yuba City reports the receipt of 2500 sacks of grain per day. The crop will be larger than anticipated.

T. F. White of Chino has an order for one of his road-oiling machines from Lexington, Kentucky.

The sixth regiment is encamped for its summer drill at Santa Cruz; the seventh regiment at Coronado.

The first shipment of Bellefleur apples will begin in the Pajaro valley about the middle of September.

B. F. Moore, of Pomona, berry grower, supplied twenty tons of blackberries to the Pomona Cannery.

The grain growers of Sutter County are urging the reorganization of the old Grain Growers' Association.

The most destructive forest fire occurred near Nevada City last week. Many acres of timber were destroyed.

Ten thousand acres formerly in a big ranch at Willows is to be subdivided and placed on the market in small holdings.

The Sutter County Almond Growers' Association is advertising for bids for a large almond crop. It will control 150 tons.

There is a great scarcity of horses in Manitoba, and heavy shipments are being made into that section. Some days as high as eight cars.

Watsonville rejoices in the erection of a large number of packing houses for handling the largest crop of apples in its history.

The campaign for spraying in the Pajaro valley has been so successful that those who were opposed to it have entirely changed.

The city of Pasadena is having a little excitement over the strenuous work of its humane society. Several arrests for cruelty to animals have resultd.

A tempest in a tea pot seems to have been stirred in the Highland insane asylum by a discharged employee. Investigation has proved that the charges contain no truth.

A report from Astoria, Oregon, shows an immense run of Royal Chinook salmon. The run is said to have lasted several days, and hundreds of boats are taking advantage

The Tulare county shipments of citrus fruits amount to 896 carloads, of which Lindsay shipped 351, Porterville and near by places 308, Exeter and Lemon Cove 195, Zante 33, and Sultana 112.

Irwindale is becoming the cucumber center for the southern part of the state. The daily shipments from there to Los Angeles amount to 200 or 300 sacks. The net to growers is about $20 per ton.

Banker I. W. Hellman predicts that the financial troubles of Wall Street will in no way affect the prosperity of the country. He also says that the Pacific Coast is not dependent upon Wall Street for its prosperity.

The early prediction that the crop of prunes for this state this year would only be a half crop has been withdrawn and it is now claimed the crop will be very fair. Oregon has prospects of an exceedingly large crop.

The supervisors of Monterey and Santa Cruz counties are considering the advisability of appropriating $500 for further experiments to determine whether the larva of the codling moth, which find lodging in packing houses, may not be successfully exterminated.

One day last week 150,000 boxes of peas were sold at Suisun for $1.00 per box.

Geo. C. Roeding is encouraged at his success this year in shipping fresh figs to Eastern cities.

The work of establishing the poultry experiment station near Petaluma is going forward satisfactorily.

Professor F. L. Beals, of the U. S. Department of Agriculture, is now in Sonoma county studying the bird pests in the orchards and grain fields.

The recent shipment of pears and plums from California to London was a success. The fruit arrived in good condition and sold for good prices.

"Santa Rosa's Pride," Lou Dillon, has won fresh honors at Cleveland, Ohio. Her last achievement was a mile in 2:02¾ against a heavy wind.

Petaluma is discussing the advisability of adopting the "Santa Rosa idea" of having an auction day at home, for the sale of eggs and poultry.

Professor E. W. Major of the animal industry department of the State University is in Northern California purchasing cows for the use of the dairy school.

Secretary Filcher of the State Board of Trade called a meeting of the vineyardists and wine men in San Francisco last week. Plans were adopted for a gigantic exhibit of California wine at St. Louis.

The Union Pacific and Oregon Short Line have announced that they will refuse to carry over their lines consignments of sheep not accompanied by clean bills of health from the United States Bureau of Animal Industry.

The various fruits unions of Santa Clara county, with the Santa Clara County Fruit Exchange, have re-united in re-establishing their common selling agency which went out of existence at the organization of the prune trust These organizations are incorporated bodies.

The Grange, of Healdsburg, at a late meeting, passed resolutions denouncing the adulteration of wines and asking for state legislation o the subject. They instructed their delegates to the State Convention, to be held at St. Helena Aug. 15, to introduce a similar resolution into that assemblage.

At a late sale held by the Santa Rosa Poultry Association the San Francisco buyers combined to keep the bids for eggs below 25 cents per dozen. The Association refused to sell and stopped the auction. They sent a representative to the city who got what the producers demanded

Thos. J. Fisher has taken charge of the Lakeside Hotel, near San Diego, and is putting it in first-class shape for the reception of guests at this delightful resort. The hotel is surrounded with pisturesque grounds, which with the lake, make it one of the most attractive resorts.

E. H. Twight, viticultural expert at the University of California, is authority for the statement that the grape crop for this season will not be as large as has been promised. He said the inroads of phylloxera and the Anaheim disease are such that the output will be seriously cut down.

Business men of the city of Los Angeles are agitating the question of consolidating the city and a portion of the county. This will involve cutting off the northern section in which is Lancaster, also the eastern section with Pomona as a center from Los Angeles county. The move was inspired by a desire for more economical administration of the city and county affairs.

Agents have been scouring the San Joaquin valley buying all the wheat they could . For a time it was not known who were the purchasers. Then the story came out that the mills of California had been caught in a losing proposition on the shipment of flour to the Orient. Early in the season it was thought that it would be easy to buy all the wheat required at from $1.35 to $1.40, but at this writing fancy milling is worth $1.59.

A beet sugar factory is being erected at Caldwell, Idaho, to cost $80,000.

A large smelter is to be built near Bakersfield. There will be two fifty-ton furnaces.

Heavy and long continued rains have nearly ruined the crops in Austria. Ths loss is several million kroners and the end is not yet.

The Guggenhime Company, San Francisco, has purchased the stock of almonds of the Davisville Almond Growers Association, aggregating 238 tons.

Paul Bertali, of Santa Rosa, manufacturer of macaroni, is rapidly extending his business. He now sends monthly to San Francisco 8000 pounds, besides smaller quantities to neighboring towns.

The Packing-house Employes' Union of Fresno, has demanded of the raisin packers that none but union men shall be employed. The wages demanded are 12½ per cent higher than was paid last year and are: For common labor, 22½ cents an hour; women, day labor, 17½ cents an hour; stemmer men, 25 cents an hour; kiln men, 30 cents an hour; packing seeded raisins, 5½ cents for one-pound cartons; larger packages, 7 cents, according to grade.

GENERAL NOTES.

The world's consumption of sugar annually is about 10,000,000 tons.

The 6,000,000 acres of state forests in Prussia yield a net annual profit of $9,000,000.

Bavaria has 2,150,000 acres of forest, from which she derives a net return of $3,222,000 a year.

From over 2,000,000 acres of productive forest owned by the French government a net profit of $1.91 per acre is had yearly.

At a late public sale of hogs at Peru, Indiana, a fine sow sold for $2100. The Standard Farm Company of Logansport was the purchaser.

German exports to the United States during the fiscal year ended July 1st last was $119,778,625, or a net increase of $18,064,561 over the preceding year.

The "Chicago Live Stock World" says the country is facing a shortage in beef cattle, and that we are to return to the prices of the summer of 1902.

Pig iron production during the first half of 1903 was over 9,707,367 tons, and good critics say the outlook for total output of over 20,000,000 tons in 1903 is excellent.

Frederick Vayerhauser, E. H. Harriman, T. B. Walker and Jacob Blodgett have joined forces with James Hill and purchased such enormous quantities of timber lands in the West that they will be able to control the Western lumber market.

There is a dairy farm at Quednau, Prussia, of 450 acres. The buildings, including the barns and outbuildings, are lighted by electricity. The pumping of water, driving of saws, mills for grinding feed, the great churns—all machinery is run by electricity.

A statement prepared by the Bureau of Insular Affairs of the War Department shows the customs revenues in the Philippines for the first four months of 1903 to have been $2,931,782 against $2,901,011 in the same period in 1902, and $1,255,657 in 1899.

A RICH SECTION.

A section of country out of the beaten paths is that along the coast north of San Francisco. The counties in it are Marin, Sonoma, Mendocino and Humboldt. The California Northwestern railroad passes through its richest valleys and its finest scenery.

In the four counties composing this section there are 7,123 square miles, or 4,558,720 acres, and a population of less than 100,000. There is plenty of room for a million. Although we have only two seasons, summer and winter—a dry season and a wet one—no irrigation is required, and no crop has ever been lost through drouth.

R. X. Ryan, Mutual Life building, San Francisco, the general passenger agent of the above named road, freely gives information regarding this rich section.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so faras possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

Nervous System—The nervous apparatus of insects is quite like our own in a general way. There are two kinds of nerve matter in both; the gray cells, which if we liken this system to telegraphy, receive and transmit the messages; and the white fibers, which like the wires of the telegraph carry the dispatch. There are also two parts of the system; the cerebro-ventral, which answers to our cerebro-spinal, brain and spinal cord, and the sympathetic. The latter and the brain of the former recall our own in position, while all but the brain of the former is ventral. Thus what answers to our spiual cord is close along the lower side of the insect body. This consists of a chain or series of ganglia—masses of gray matter—connected by a double cord of white fibers. In our own spinal cord the gray matter is continuous. The brain of the higher insects, bees and ants, is also quite large and complex; we even find quite considerable convolutions. As we study the habits of these higher insects, we do not wonder at the high structural development of the brain.

* * *

Glands—The glands of many insects are phenominal in their development. Thus in the silk-moth caterpillar or larva, the so called silk worm, the silk glands which are only enlarged salivary glands reach back and almost fill the abdomen. In bees there are two pairs of large glands in the head, one of which connect with a similar though larger pair in the thorax. All four of these have a common duct which empties at the very base of the tongue. The secretion from these contains the ferment that digests the nectar or cane sugar and converts it into honey. Thus we see why honey is so desirable as food. It is digested sugar, and requires no digestive effort to fit it for use in our bodies, as we take it for food. We need much sugar, especially when young, I believe we can do no better by our children, than to give them all the honey that they wish at each meal. The other head glands of the bees furnish the digestive ferment that acts on the pollen or proteid food of the bees. This then answers to our gastric juice. The bees and all stinging insects have poison glands which produce the poison. These are large and secrete the poison which is stored in a great poison-sack, located just at the base of the sting. Many insects have glands at the base of hairs which secrete an odorous substance which evidently serves to protect the insect, as the bird does not like it, and so is slow to take these instces, which it refuses unless pushed by extreme hunger.

* * *

Reproductive Organs:—As we should expect these organs are in pairs and are situated high up in the hinder part of the abdomen. In form, position, structure and development they remind us of the same in many of the higher animals, though the ovaries are tubular instead of follicudar, and the testes are follicular instead of tubular. The eggs and sperm cells recall strikingly the same in higher animals. If we use a circle to illustrate a cross-section of an insect, the centre will mark the alimentary canal or digestive track; the heart will show at the top or dorsal region; the breathing tubes extend along the sides and will show at the sides of the circle, while the nervous cord will show below, or at the ventral side. If well back in the abdomen, the reproductive organs would appear high up between the breathing tubes and heart, one on each side.

* * *

SEASIDE INSTITUTE.

This experiment was a decided success in most respects. In fact the only special regret or criticism was the small attendance from the immediate locality. The program was exceptionally strong, and that it was appreciated was evidenced in the close attention paid by the large audience for nine hours each day for a full week. The five series of course lectures were given closest heed, those of Mrs. Minnie E. Sherman attracting exceptional attention. Her style is very taking, her fund of information surprising, while the success which she has attained in dairy lines and fruit production is rarely excelled by any one in any place. We are to be congratulated that she is to be one of our regular institute staff.

It was the unanimous wish of the large, able and representative audience that the Seaside Institute should be an annual function. The wish was also expressed that the manager should be authorized to secure the service of some competent reporter, who should give a full and correct report of the important proceedings of this and the Farmer's Clubs' Institute, and if possible of all the local Institutes.

The two most stirring papers were those of R. C. Alen and Prof. C. B. Sumner. The former one of our most capable and successful farmers, settles the vexed question in favor of the distillate spray, and the latter a masterful presentation of the subject of organization, so pleased the audience that it was voted and stoutly urged that all papers in Southern California be pressed to print the paper in full.

* * *

CABBAGE CATERPILLAR

The gardens about Long Beach are seriously injured by the caterpillar of the cabbage butterfly. Pieris rapae. This common white butterfly, with two black spots on the upper side of the front wings of the female, and one in the male, was imported from Europe only a few years ago, and is now in every state and territory. It is the worst insect pest of the cabbage. The eggs and caterpillars are green, and the chrysalis a yellowish-green. There are two broods and possibly three in this region. If we would have saur krout we must fight. The remedy is Paris green, one ounce to 12 gallons of water with 1-4 pound of lime added, for the caterpillars that work before the cabbages are headed. For the later broods, I would use "bubach" or pyrethrum, one ounce to a two gallon pail of water. I think the danger not great of using Paris green at all times, but others would object, and as bubach is effective, and has no objections, I would only recommend it after the cabbages are headed.

* * *

GALLS ON ROOTS OF MULBERRY.

Subscriber from San Diego sends roots of mulberry thickly beset with tubercles, much like those caused by bacteria on legumes, or root-form of Phylloxera on grapes, or nematoid worms on various plants. Something is surely working to irritate the roots. It is probably nematoid worms or possibly aphids. If the tree seems to suffer, I should try bi-sulphide of carbon as often recommended in the Cultivator for such injuries.

* * *

SURPLUS HONEY.

P. C. Cartter, Monrovia, asks why it is not wise to have honey stored directly in glass jars, and why it is not desirable to sell chunk honey in pails filling the pails with extracted honey. He has a good market for such honey.

It is not practicable to secure honey in jars except for exhibition. It is difficult to get the bees to store in the jars, the jars cost too much, and the glass is stained to serious disfigurement. The common sections are preferable in every way. Chunk honey, as suggested, has been sold often and in quantities. It is not neat and would not be desired by many. There is a prejudice against it as it has been a common form of mixing glucose with honey. The glucose keeps the liquid retainer from candying, which would be desirable. But the glucose is unwholesome and a fraud and we wish none of it. There is no objection in selling chunk honey in pure extracted honey, if the market warrants it.

* * *

AUTUMN INSTITUTES.

The fall series of institutes begin with La Habra, August 17th. On August 26-27 will be held an institute at Santa Barbara inconnection with an exhibit of cattle. Mrs. Minnie Eshelman Sherman, and Prof. Anderson will both be with us. Prof. Anderson will judge the cattle. An institute will be held at Goleta August 28th, and 29th at Carpenteria August 31st and September 1st. On September 2nd and 3rd an institute will be held at Ventura and on the 4th and 5th at Fillmore. On September 7th there will be an institute at Fernando, and on September 8th and 9th, at Tropico. Others will be announced next week. Dr. and Mrs. Sherman will help at all these institutes. Horticulture Inspector Maskew will talk apples. Prof. Anderson will not be able to aid us beyond the Santa Barbara Institute.

* * *

SANOSIN.

We have recent accounts, gained through our German Consul, of very important work now being done in the German laboratories. This looks to nothing less pretentious than the curing of that dreadful disease, tuberculosis. It is reported that a German, dwelling in Australia, noticed that where the eucalyptus abounded consumption was less prevalent, and some of the native tribes use a concoction from various species of eucalyptus quite successfully in curing this dread disease. The account runs that this gentleman commenced experimenting and has succeeded in securing an article composed of carbon, sulphur and eucalyptus extract which is very deadly to the microbe of tuberculosis. Numerous experiments are claimed to have proved that when sanosin is vaporized in a room it has rare curative properties, so that many cases of confirmed consumption have been entirely cured by this treatment. This certainly is a remarkable discovery, if the results are anything like what they are claimed to be.

This leads me to urge the further planting of the eucalyptus in our waste lands and along our California roadsides. If this tree has curative influences against the disease which will ever be more or less prevalent in our delightful, salubrious southland, then surely we have another reason for the liberal planting of the eucalyptus. If we are wise in selecting the varieties we will also have a tree of great economic value and will add to the beauty of our landscape as we cannot do in any other way. I find I am coming more and more to admire the rare grace and beauty of these splendid trees. The eucalyptus is also to be recommended because of its very rapid growth. We must remember, also, that it comes from Australia, whose arid climate is very similar to our own, thus these trees have grown up under neglect of moisture, and are fitted by their very bringing up to resist extremes of heat and drought. Thus it is that no tree will be more sure to thrive under our peculiar conditions than the various species of the eucalyptus. I wish to speak of a few species that I am sure no one will regret having planted. For ornament I am very fond of E. viminalis. We have many of them on our main avenue in Claremont, and, except where that arch despoiler, the electric wire fiend, has mutilated them, they are indeed models of grace and beauty. The trunk is white, the leaves narrow, and the branches drooping. This gives a combination that can hardly fail to attract the attention of the most unobserving. I wish also to recommend E. sideroxylon. I have one of these in front of my house, and often hear people commenting upon its beauty. The foliage is especially attractive and it has the same graceful drooping habits that makes E. viminalis so admired. The rdt gum, E. rostrata, is also a beautiful tree for roadside planting. I feel grateful every time I drive to Pomona, to one of our neighbors, who has had the good sense to plant a fine row of E. rostrata along the road in front of his place. These send out a beautiful rich white bloom in the early spring time, and as the blossoms remain for a long time, they are doubly attractive. These trees are also more symmetrical than are most of the species of eucalyptus. I am not acquainted personally with the habits of E. rudis, but my friend, Prof. A. J. McClatchie, praises this as one of the very best of the eucalypti. He is certainly authority, and upon his authority, as also of Mrs. Minna E. Sherman of Fresno, I do not hesitate to recommend E. rudis to any who contemplate tree planting. Of course, we shall all want Eucalyptus ficifolia. Its brilliant scarlet bloom is so attractive that it ever wins admiration from all who see it. This tree, however, is rather adapted for the home grounds, as it is not a rapid grower, and I understand does not attain the size of the other species, all of which attain majestic proportions. Another species is E. citriodora. This is desirable from its beauty and the pleasant scent of the leaves when pressed. It has the objection, however, of not standing heavy frost. It is likely to kill back if the thermometer goes down to 25 degrees F. during the early years. I know of one in Claremont that has now become quite a sizable tree. It killed back quite badly in its earlier years, but has passed the two last winters of quite severe frost entirely unscathed. I sincerely hope that this article will induce many to set eucalypti. One of our neighbors set a year ago quite a large tract of the common blue gum. Eucalyptus globulus. They were set on stony ground unfit for anything else. They have made a wonderful growth and are now a real ornament to the landscape, and also conceal an unsightly stone heap. If all our people who own such land would follow this gentleman's example it would be an incomparable blessing to our state. It is also worthy of remark that evergreen trees like the eucalyptus may safely be set at any time of the year. We have only to look to it, that the roots are never exposed, but are always kept moist. Then, by giving a little attention to watering for the first two weeks nature and the vigor of this tree will do the rest.

* * *

FOG FRUIT.

I have been repeatedly asked regarding the merits of fog fruit , usually referred to as Lippia repens. It is really Lippia nodiflora. It has been used somewhat as a substitute for lawns. It belongs to the same family as the lantanas and verbenas. They are mostly American and there are many of this genus. The one in question is wide of distribution and grows on very poor soil and with every little water. It is a creeping plant and the stems take root from the nodes. The roots thicken below during the time of rain and thus the plant maintains itself in times of drought. The plant is not resistant to alkali but as stated above is one of the best plants known to stand drought. It will also stand quite a degree of cold. Its temperature range runs from 10 degrees F. to 110 degrees. Good authorities say that it will keep vigorous with less water than any other desirable plant that grows within our borders. It is not a good grazing plant nor does it produce a large amount of foliage. In case we wish to cover a piece of ground with a mat of pleasing vegetation or in case we wish to fix the sand that it may not blow away, this fog fruit may well be secured. Therefore Lippia nodiflora is excelent to plant on reservoirs and on embankments that are liable to be washed. If, as stated, this plant does not develop seed, then surely it cannot become a serious injury. It is not difficult to eradicate. At certain seasons it is covered with bloom that is very attractive to the bees. In case we cannot get enough water to grow a clover lawn, then we may well utilize this Lippia nodiflora.

A fresh egg has a somewhat rough shell; a stale egg is smooth.

California Horticulturally...

John Isaac, Sacramento

BENEFITS OF WINTER IRRIGATION.

Winter irrigation is growing in favor in the Santa Clara valley and it has been demonstrated that those fortunate enough to have a supply of water and wise enough to use it, have sustained no losses from dying trees and have had pretty good crops. For several seasons there was a great shortage in the rainfall here, in common with the rest of the state, and the level of the subterranean water table was lowered to so great an extent that the roots of the trees in many cases stood in dry ground. The annual rainfall was not enough to fill the soil down to the lower level and as a result the trees died from drought, and many, which did not die, were so weakened that they have not yet recovered despite the fact that we have at last had a season of abundant rainfall. Where the soil was filled with water during the winter months and then properly cultivated, the trees have done well and have returned good crops.

* * *

GOOD WORK AGAINST THE CODLING MOTH.

Good reports continue to come from the apple sections of the Pajaro valley in regard to the efficacy of the work being done there this season against the codling moth. Under the direction of Prof. Woodworth, thorough and systematic work in spraying with Paris green has been done, and it is reported that, in some of the orchards treated, there will be not to exceed three to five per cent of wormy fruit. Various compounds have been experimented with and so far it is discovered that there is no better wash than the old reliable Paris green which our orchardists have relied upon for many years. It is something to have learned this, and something, too, to know that by getting pure Paris green and using it with some regard to system, so much can be accomplished as has been done this season. It is a very difficult thing to convince the doubting Thomases and to get these doubters to line up with the workers who have faith. It is these men who hold back and nullify the work of the progressive farmer, for if a man spent ever so much money, time and energy in fighting a pest, and his neighbor stands by and does nothing, he is wasting his time and accomplishing no good. It is in demonstrating that Paris green is the best insecticide to use, in proving that if used properly it is effective, and in getting all or nearly all to work together, that Prof. Woodworth has done yeoman's service in his summer's campaign against the Codling moth in the Pajaro valley this season.

* * *

LIME, SULPHUR AND SALT AN EFFECTIVE WASH.

The California wash for scale pests—salt, sulphur and lime—is winning for itself a great reputation in the East, where for some time it was declared wholly ineffective. All sorts of reasons were adduced to account for its inefficiency east of the Rockies, while it was so perfect a remedy on the Pacific Coast. The difference in climate was finally allowed to be the reason, as they have so much rain in the East that the compound would not remain on the trees long enough to do any good, but this seemed a poor reason to Californians inasmuch as our spraying is done during the rainy season. Continued experiments there, however, have demonstrated all that we have ever claimed for salt, sulphur and lime as a destroyer of San Jose scale and other members of the aspidiotus family. At the last meeting of the Association of Economic Entomologists in Washington, D. C., Prof. A. L. Quaintance, State Entomologist of Maryland, made a report on this wash and stated that in several experiments he had made with it he had found it very effective, practically killing all the scale on the trees sprayed. The scale were not killed at once but many lived some time after the application, and young ones were hatched from eggs laid after the application of the wash, but all gradually died and in the fall the trees were free from the scale, and perfectly bright and clean. In winding up his report he says: "The final outcome of these tests of the wash was quite a surprise. It would appear that results have been expected too soon after the application of the wash, and it further appears that a sufficient amount of the wash probably remains on the trunks and limbs to destroy the larvae coming from those females which escaped the treatment. The final effect of the wash in the two cases cited, and in other cases that have come under my observation, leads me to believe that we have a most valuable treatment for the San Jose scale in the lime, sulphur and salt wash."

* * *

NO LABOR SHORTAGE THIS YEAR

We are now in the midst of the busy season. Canneries, dryers, packing houses are all in full operation, and work in the hop fields, orchards and and vineyards is in full swing. An encouraging feature of the work this season is that, so far, there has been little complaint of lack of help. It is true that very many more people could find employment than are now engaged, but sufficient help has been obtained to make us feel comfortably sure that very little if any of the present season's fruit crop will be lost. Very much apprehension was felt early in the season for fear that there would be a repetition of last year's experience in this mater, but as "forewarned is forarmed" our fruit men have been preparing against a shortage and have done fairly well in avoiding it. A great deal of credit for this is due to the labors of the California Promotion Committee and the Committee on Labor appointed by the Fruit Growers' Convention, who have worked together, and by their united efforts have induced a very large immigration of young people to come to work in the California fields and orchards.

"The insect sees the tiny mite,
And eats him as his natural right;
The chicken sees the insect fair,
And dines upon him, then and there;
Man eats the chicken, if he can;
And such is nature's wondrous plan,
That this same man—perhaps 'tis just—
Is swallowed up by some big trust."
—Coleman's Rural World.

THE "BOSS"

TREE PROTECTOR

Made of Yucca Palm

Is cheap, durable and quickly put on the tree. It prevents Rabbits from destroying your trees. A sure protection against frost, sun-burn, grasshoppers or dry winds. can be easily removed; will last for years.

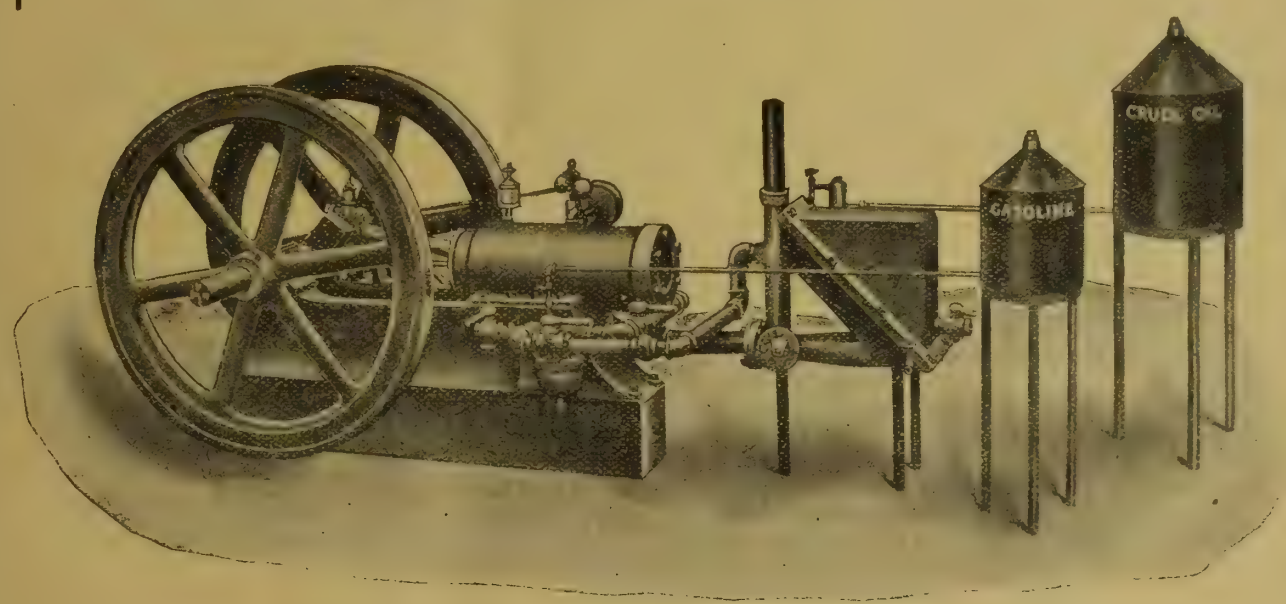
Samson Crude Oil Engines

Are the most reliable and simple engines for all purposes. With our crude oil generator attached, as shown in cut, it is the cheapest power on earth.



We are continually attaching our generators to other makes of engines, even to those which already have crude oil generators, because ours is simpler and requires no attention after the engine is started.
We also manufacture centrifugal pumps of the highest efficiency, for which the SAMSON has a high reputation.

Complete Irrigating Plants

ARE OUR SPECIALTY

We can furnish you just what you need, and can tell you your requirements, as our experience is very large. When you buy the Samson Engine and Pump you get the best, and it costs you no more than would other makes that are often times unreliable. Every part on our engines and pumps has been thoroughly tested and no parts of them have ever broken.

We are continually making extra parts for Eastern-made engines, as we can prove to you if you will call at our works. These parts are expensive to the owners of such engines, and should be taken into consideration before buying.

We have this harvest season placed (4) of our Samson special made harvester engines on combined harvesters owned by J. Brack, Jr., Lodi; W. Journeay, New Hope; Warren Fowler, Lodi; A. A. Sturgeon, French Camp. These engines have made a record for us and have proven what the Samson is. Fifty acres are being threshed daily with each of these rigs and the expense of operation is not as much as with horse power.

We are soliciting orders for these engines for next season. Give us a call when in Stockton, or drop us a card and we will call and see you.

Samson Iron Works Stockton, Cal.

By J. W. Mills, Ontario, Cal.

BUDDING WALNUTS.

Editor Cultivator:—Can you inform me through the Cultivator where a double-bladed knife, as you described some time ago, can be bought. I want it for budding walnuts. Any information you can give regarding time of budding the walnut or other pointers on the subject, will be gratefully received.—W. G. Clark, Riverside.

The double-bladed budding knife you want can be secured from or through the seed and plant firms who advertise in this paper.

The walnut should be budded in the late summer when the bark slips readily. If the trees are kept in a vigorous condition, August and September are the months. The proper way to secure good one-year-old budded trees is to bud the seedlings in the fall and allow the buds to lie dormant over winter. In the spring the top is removed and the whole summer's growth is forced into the bud. We have seen such buds make over fifteen feet growth during the first season in the nursery.

The ring bud that is made with a double-bladed knife is very simple, the cut that removes the bud from the scion is repeated on the stock. The bark is removed from both and the scion bud is inserted in the place where the bark is removed from the stock, and bound with waxed cloth. The double-bladed knife insures a perfect fit.

The patch bud is made by making two parallel cuts around one side of the stock, then cutting a vertical slit so as to make two flaps when the bark is raised. A square piece of bark cut so as to contain a bud in the center, is taken from the scion and placed beneath the flaps of bark on the stock, so that the bud comes directly under the two edges of the flaps. The upper and lower edges of the two sets of barks must match. This will occur if a double-bladed knife is used; if such a knife is not available, have a piece of cork, or some guide, to place where the cuts are to be made.

* * *

CORN WORMS.

Editor Cultivator:—How shall one get rid of the corn worm? Is grape pomace from the winery good as a fertilizer? If not, why?—A. C. Rice.

The corn worm can be controled to a certain extent by dusting dry Paris green into the tassle end of each ear, when the silk is well out. The millers lay their eggs in the "silk" of the ear and when the young worms are first hatch out they eat the
they reach the grains of corn. When once in, there is no remedy except opening the husk and picking them out. That is not practicable, besides it destroys the upper end of the ears.

The refuse from wine grape presses (the pomace) is of little value as a fertilizer, because it does not contain largely of the elements of fertilization that are usually deficient in soils. It is hardly worth paying anything for, but can be used profitably as a fertilizer on the premises as it has to be removed from the vicinity of the presses, and can be scattered in the vineyard or field at that time.

* * *

TOMATO WORM.

Editor Cultivator:—What is the large green worm which is found in tomatoes? I am told that it is the same as is found in green corn.—E. Smith, Whittier.

The large green worm that is often found eating the vines is different from the corn worm. There is a worm that is occasionally found eating the fruit of the tomato, but they are usually confined to the early crop and do very little damage. They are the same as the corn worm. The large green worm that eats the vines belongs to the same species as the Eastern tobacco worm. They are the larvae of the sphinx moth. They are never very numerous but a few of them will do much damage. Close watching early in the season with the removal of all infested tomatoes and large green worms that are on the vines, will prevent any material damage during the balance of the season.

* * *

GRAPE BUDS FAILED.

Editor Cultivator:—I have been studying Bulletin No. 146 on New Methods of Grafting and Budding Vines, and have failed to have any success. I thought probably it was not the right time of year and as the bulletin does not mention the time of year, I would like to know all about that. I suppose my failure was due to the fact that I did it at the wrong time.—Wm. H. Overholtzer.

The bulletin does not state any particular time of the year in which to do the work, but gives accurate directions as to the condition in which the stock should be when budded. The buds should be inserted when the stock is still flexible. At that time a slit can be made lengthwise with the branch and if the bark is loosened along the edge of the slit, the bark will separate readily and bulge out if the branch if properly bent at that point. The buds should be from succulent growth. After they have been inserted and the branch straightened and wrapped with waxed cloth, fully 90 per cent of the buds should grow. When old vines are to be budded to new varieties, the budding must be done in a hurry if many vines are to be worked over, as the buds must be inserted at a point about two leaves from the tips of the new vines. If the work is left till the vines grow out longer, the buds will have to be put out from the stock a corresponding distance, which will make a head that will be too high. When it is desired to bud onto resistant vines for nursery cuttings, the process can be continued all summer long. When old vines are to be budded, different varieties may have to be budded at different times, because some varieties start out earlier than others. For these reasons, no date is given in the bulletin for doing the work.

SONOMA APPLE.

Editor Cultivator:—In Bulletin No. 147 from Berkeley, June, 1902, page 71, mention is made of an apple, "Sonoma." The report says that it is a strong grower and a good bearer. Will you please tell me whether it is a winter apple or not, its color and quality, and if it is the same as the "Gold Ridge Winter."—J. B. Wolfskill.

Sonoma is a late fall apple with us, but under proper conditions would be a winter apple. It has water core with us, consequently will not keep well. It is not very good quality. It cannot compare with the Missouri Pippin, which is not as fine as our Yellow Newton Pippins or White Winter Pearmain. Sonoma is barrel shaped with the calyx cavity often so shallow that it is on the level with the regular surface of the apple. The skin is a dirty yellow, streaked with brown. I do not know the Gold Ridge Winter by that name.

* * *

CURL LEAF OF PEACH.

Editor Cultivator:—What is the cause and cure for curl leaf on the peach?—H. P. Hudson, Escondido.

Curl leaf on peach trees is caused by a fungus. The disease will denude some varieties of peaches of leaves and fruit early in the season. The past spring was most favorable to curl leaf, it being moist and cool during the months when curl leaf is most active. Some varieties are so susceptible that not a single leaf will remain free from the curl, while every peach will be dropped. Other varieties in an adjoining row will remain perfectly immune. Briggs Red May, Hales Early, Tuscan Cling and Yellow Tuscany are always free from it.

The remedy is to spray with Bordeaux mixture. Two sprayings had better be made, one early in the winter and one late, just before the blossoms open. If the trees are infested with scale, lime, sulphur and salt spray can be used as late in the winter as possible, just as the blossoms open. By adding 10 pounds of blue-stone to every 100 gallons of lime, salt and sulphur wash, there will be little if any curl leaf. The above wash is very troublesome to make, and if only fungus troubles affect your trees, Bordeaux mixture is more desirable; it requires no cooking and after the blue-stone is dissolved can be made in a few minutes; 4 lbs. of blue-stone, 4 lbs. of lime and 40 gallons of water make the right proportion. It is best to make the 4 lbs. of lime up to 20 gallons, the blue-stone the same and mix the two while being stirred vigorously. If concentrated solutions are mixed and water added afterward, there will be a heavy percipitate of the lime and blue-stone which will injure the efficiency of the spray.

* * *

ALLIGATOR PEARS AND CUSTARD APPLES.

Editor Cultivator:—What is the best place for Alligator pear trees and the Custard apple or Cheroimyer. What treatment should they have in this climate?—B., Glendale.

The best place for those two fruits is where there is no frost and a good supply of moisture. They are natives of the tropics and tropical conditions must prevail is any degree of success is to be expected. A light frost will not injure the trees, but if it gets down to freezing, those fruits will never reach maturity. There are certain small areas along the foothills in some of the valleys in which those fruits mature. We are told, however, that they do not approach in quality the fruit that is grown in the tropics.

The trees do not require any different treatment than the orange. They like good soil and plenty of moisture.

TRIMMING DEWBERRY.

Editor Cultivator:—When the fruit of the Gardena Dewberry has been gathered, should we cut all growth clean to the ground, or simply cut the old canes, leaving the new growth for next year's crop?—J. M. S., Otay.

This question was submitted to W. M. Gray, the original "Gray's Gardena Dewberry" man, and he gives us the following:

The old and the new growth should all be cut clean to the ground as soon as the crop is taken off. After this date, August 8, I would leave the new growth and cut out all old wood. But if taken early, the removal of all old and new wood destroys nearly all scale.

The wool growers of Tulare County held a meeting last week in which they appointed delegates to go before the commissioner of forest reserves and demonstrate that sheep in the mountains do no damage to the forest.

LONG BEACH
BUSINESS AND CORRESPONDENCE COLLEGE
A select, high-grade school, modern in equipment and methods. Comprehensive and complete Business and Shorthand courses under superior instructors. Delightful location in favorite seaside suburb of Los Angeles; healthy, inexpensive. Enter at any time; catalogue free.
Long Beach Business College
LONG BEACH, CAL.

Be Sure and Get
Woodward's Adjustable Prop Bracket
The Only Bracket That Will Adjust Itself to Any Prop

They are cheaper than any other Prop Bracket that can be made, and will positively not get out of order. No nails or splice to break; no time spent in repairing; can be padded if you wish without nailing. Stand props as near the bottom of trees as possible and they will not be in the way of cultivation. If the Bracket is sprung apart so as to go on part way of the Prop it will take a side hold and will never slip. If the Bracket should be too loose press the sides together so as to make a little friction on the sides of Prop and it will stay in place better while being put up.

Having reduced our price to $17 per thousand, we would be pleased to have a continuance of your patronage and can fill all orders promptly.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE CAL.

SEASIDE PLANTING.

While seaside residents are asking what best to plant in their yards, the observant gardener cannot but wonder why they do not use their eyes instead of making so many inquiries. While at the Long Beach Institute the writer was asked by several about trees for such localities. First comes our native cypress (Cupressus macrocarpa), commonly called "Monterey Cypress" This seems to do well everywhere, and on the coast grows a sturdier form than inland At Terminal Island there are many fine specimens, as there is of several species of acacias, too. Of the latter trees the ones known as A. cyanophylla and A. saligna seem to endure the best, though A. melanoxylon appears to thrive very well close to the water. The common "Blue Gum" and many other eucalypts are excellent, and more species of both euclypts and acacias should be tried.

* * *

APPROPRIATE PLANTING.

Sometimes people go to the other extreme than noted in the above article and plant indiscriminately, without considering locations, climates, soils nor the many other matters to be taken into consideration. The greatest mistakes are made when carrying out extensive plans for "improving" a landscape of considerable area.

Hillsides already covered with fine native shrubs are denuded to make room for introductions from foreign countries that are never so well suited to either soil or climate. Then, too, the same trees are planted solidly at all altitudes and over both hill and dale. Now, nature distributes her vegetation in zones and certain plants reach certain heights and then the hillside covering changes to something else, and so on to the summit. So too, do different trees and shrubs grow in the canyons than on the open hills.

Nature should be aided in her efforts to give us a diversified topography and for this reason canyon floors should be left unplanted with anything tall and in considerable numbers and the surrounding hills should be freely covered. In this manner the hills are made to appear taller and the canyons deeper. Too many plant in the canyons only, because it is hard to start a tree or shrub growth on the hills. If so planted, when the trees attain the same height as the hills on either side, no canyon will appear if viewed from half a mile or more away. Not all (or any, for that matter) hillsides are covered with a solid growth of any one tree or shrub and it is the height of folly to attempt to beautify slopes by such planting. If natually bare, an improvement there certainly will be, but the results will never be really beautiful or harmonize with the landscape. Open glades and masses of native shrubs would vary the otherwise monotonous mass and make an easy transition from the "improvements" to the natural scenery.

* * *

OUR SCARLET LARKSPUR.

Larkspurs are usually from white to dark blue in color, but we have one in Southern California that is a most brilliant scarlet. It is tall growing species, often attaining a height of seven or eight feet, and flowers abundantly. It does not seem to be particular about either soil or location so long as the soil is well drained. It may be found in the hot, dry sand of a southern exposure as well as in the shade of dense underbrush on the north slopes of hills, with pure leaf mold for soil. Its roots are perennial so that once established it will be with you always. Altogether it is one of our most handsome natives and should be in every garden. Those who live near its native habitat should mark its place while in flower and dig the roots at any time from the present to early spring. If dug now they should be packed away in dry sand or soil, in a cool, dry place, and planted out very early in the spring. While at the Long Beach Institute the writer offered free seeds of this flower to all furnishing a self addressed and stamped envelope. Many envelopes were handed in and every day since has brought requests by mail. Plenty of the seeds are yet on hand and the offer is still open to Cultivator subscribers.

* * *

BUILDING SITES.

Now that magnificent country homes are springing up all over our favored land, more attention should be paid to building sites. No amount of skill on the part of the landscapist can overcome great natural defects though they may be lessened if sufficient means are at hand in the shape of "current coin of the realm." A site may command a truly magnificent view in all directions and yet be so void of landscape possibilities as to be totally unfit for a home. At all times a house should be placed where it will look best, if such a place be easy of access; if too hard of approach or forced into an unnatural position, it is merely a house—not a home.

FARM ORGANIZATION.

(Continued from first page)

the common interests of the state? *

* * * *

What, now, does experience teach us as to our influence in legislation? One man may sometimes do much for us. We are thankful that we have such men. Our present Governor has done good work for us. All honor to him. He himself says we should remember one of our own representatives who stood up squarely and fought manfully for our interests and for righteousness, and we will remember him. He is here today, and we will honor him. But how little can one man do, in proportion to a close form of organization whereby our strength becomes concentrated as the strength of one man, and our strength is counted in voters. * * * *

III. You have already anticipated me in the desire to turn from the material side of this question to the intellectual and social side. We must have a living. We need a fair measure of prosperity. But prosperity is not everything. It alone does not insure happiness or well-being. It is a well-known fact that farmers and especially farmers' wives are more subject to mental disorders than any other class. This is because isolation, lack of variety, and of mental occupation. It should not, and need not be. With proper ideals it could not be. Let us have organization and stated gatherings of men and women at no infrequent periods, and let us attend them as religiously as we attend our meals, our sleep and our daily duties, and the routine will be broken up. Fresh thoughts will stimulate us to do thinking ourselves. Our minds will be active and inventive. * * * *

I trust I have made clear these among the many reasons why we should organize, viz., for the sake of economy of production, economy of handling, economy of transportation, and economy of marketing for the securing of proper legislation, state and national, for the promotion of the intellectual and social life. * * * * * *

No farmer, and no farmer's family can afford not to belong to a farmers' club. No extensive rancher will stay away from these meetings if for naught else than from pure business consideration. * * * *

How much less can the smaller rancher, whose success is utterly dependent on the most minute details in all his work, disregard these opportunities for gaining practical knowledge. How much more, too, does the smaller rancher, who as a rule has less of time and less of literature at command, need the intellectual and social stimulus of these meetings.

IV. You ask when is the best time to organize. I reply now. The quicker the better. There is always time for so important a matter even in the busiest season. Organize now. If not in the day time, in the evening. Meet whenever it is most convenient to the greatest number. Meet in the different homes. Let your meetings bring light and joy and helpfulness into many homes, as they sweetly will into all hearts.

The Pomona sewer farm reports its first year as a profitable one.

BEE SUPPLIES—G. G. Wickson & CO 123 N. Main Street, Los Angeles, Cal.

The Champion reports that the beet harvest which began Saturday at Chino will be light for several days. The bulk of delivery thus far having come from the outside districts. Samples so far tested are showing sugar content 15 to 18 per cent.

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

CHRONIC DIARRHOEA.

Editor Cultivator: I have a mare in ordinary condition, but is loose in bowels, especially when driving. Other horses treated as she is are all right. What can I do to relieve her.—J. P. S., Garvanza.

Experiment on different kinds of feed until you get something that suits her. Water at least one hour before driving and start off gently. Take of tannic acid, one ounce; bicarbonate of soda, eight ounces; mix and give one heaping tablespoonful in the feed three times a day.

* * *

FOUNDER.

Editor Cultivator: Cow became lame about six weeks ago in front right foot and leg. This extended up to shoulder. No swelling. First noticed her lagging behind when driven to pasture. Now weak in both legs with soreness in back. Flinches when pressed just forward of hip bones. Run down and weak though appetite is good and holds usual flow of milk. Feed on green peas, oats and alfalfa, and has dry grass and clover hay.—E. Pedrotte, Waddington, Cal.

This condition is caused by abundance of rich food. Allow the cow to have access to some clean threshed wheat straw. Give a purgative and follow this in few days by a tablespoonful of equal parts of potassium nitrate and sodium hyposulphite in the feed twice a day.

* * *

ULCER OF BACK.

Dr. Fenimore: Please give me remedy for my horse; he has an old sore on his back from the harness. It is about as big as a quarter and always forms a crust and underneath it is sore and contains pus. I am a subscriber to the Cultivator since May, 1902, and find it a great help to the farmer or in my case to the man that is a beginner on the farm.—Max Fischer, Santa Rosa.

Clean the wound up, remove all scabs, dead tissue and foreign material. Then apply Squibbs compound alum powder; keep covered with this all the time, and keep harness off of it.

* * *

ECZEMA OF DOG.

Dr. H. D. Fenimore: My Scotch Collie was troubled by what I think was the mange two months ago. I washed him with solution of creoline, gave him castor oil and he got well, but his hair got very thin. Now the trouble has returned. He is pink on the belly and sides, and itches a good deal. Seems well otherwise, lively, has good appetite. Lately has a swelling, size of dollar, on left side of head, under ear. If you can reply through the Cultivator I will be indebted.—E. A. Moore, Redlands.

Repeat the treatment that you cured him with the first time. Give one teaspoonful of the following three times a day after meals: Tinct. nux vomica, ½ dram, Tinct. gentian comp. 3 drams; syrup of cascara sagrada, sufficient to make 4 ounces.

In last week's Cultivator in giving formula for powder for horse with eczema we made error in placing comma in wrong place, so we give corrected formula this week. It should have read:

Give an aloes ball composed of Barbadoes aloes 1 oz., nux vomica, belladonna and ginger, each 1 dram. After that has acted mix eight ounces each of potassium nitrate and hyposulphite of soda and give one tablespoonful in the feed three times a day. Keep the itchy places well shampooed with creoline.

It is not enough to be industrious, so are the ants. What are you industrious about?—Thoreau .

BEE SUPPLIES—G. G. Wickson & Co., 128 N. Main Street. Los Angeles, Cal.

DAIRY AND LIVE STOCK

C. H. SESSIONS, ASSOCIATE EDITOR

CARE OF THE HERD.

It is a wrong idea to believe that a cow testing 5 per cent is a good cow. The cow that gives the most butter fat within a year is the most profitable cow, no matter what her test is. Don't get the idea that a certain breed is the only and best breed. A good cow is a good cow, no matter to what breed she belongs. Select the breed you like best and which is best adapted to your circumstances, and cows that milk ten to eleven months during the year; also they may have only a fair average test.

Important points that a dairyman must keep in mind, are:

1. The bull is half the herd.
2. Raise the calves from your best cows.
3. Sell all your poor cows.
4. Keep your herds in a healthy condition.
5. Feed and milk regularly.
6. Feed only wholesome food and look carefully to the drinking water.
7. Poor food and dirty water give tainted milk and impair the health of the cow.
8. Keep your calves growing.
9. Don't feed warm milk one day and cold the next.
10. If you want a good dairy cow from your calf, get a good, long body with well sprung ribs on your calf.
11. The coat of an animal is a good indication of its condition.
12. Try to have your cows "come in" in fall and winter. Winter dairying pays the best; besides, you have more time to milk in winter than in summer.
13. Try to raise all the hay for your herd.
14. Make the most out of skim milk.
15. Dairying and hog raising are a very good combination.

WORLD'S FAIR LIVE STOCK NEWS.

The National Polled Hereford Breeders' Association is among the breeders' associations making appropriations for special prizes at the World's Fair.

The National White Wyandotte Club will hold its 1904 annual meeting at St. Louis during the World's Fair.

The Club will make liberal provision for World's Fair specia. poultry prizes for that variety.

The American Association of Live Stock Herd Book Secretaries will hold its annual meeting at the World's Fair grounds and at the Southern hotel, St. Louis, August 12 and 13.

The Kentucky Exhibit Association, which has in charge World's Fair matters pertaining to that state, has sent notices to Kentucky breeders and fanciers that the Association will pay the entire expense of sending their stock to St. Louis next year.

Through the advocacy of Chief F. D. Coburn of the Department of Live Stock at the World's Fair, in the face of considerable opposition from some sources, the butter made there next year during the proposed cow demonstration will be judged by giving a possible credit of 15 points in a total score of 100 to "aroma" and 30 to "flavor," instead of ignoring the element of smell or aroma and giving a possible 45 points to flavor alone.

KEEP HENS BUSY.

Loose or shut up hens should be kept busy. Nothing is so miserable as an idle hen, so confined that she cannot interest herself in anything but walking about a filthy, cheerless yard, peering through the slats at the grass she cannot eat, the bug and worm haunted places she cannot explore. No miserable animal ever did its best, or, as a rule did anything above paying for the cost of existence, and few do that. The least that can be done with a shut up hen is to keep her busy and interested in a variety of things thrown in.

"I went to the play last night," said Farmer Begosh, "an' I tell ye it was mighty fine. One of the fellers was a Farmers' Alliance man." "How do you know, Silas?" said his wife. "Because he kep' a-hollerin' every oncet in a while, 'What hoe, without there!'"—Washington Star.

The new-born calf should have its mother's milk, not that of a stripper. It should not suck long. I prefer the calf removed the first day. Give it its mother's milk for the first week, after which skim milk may be added. At the end of the second week a little ground corn may be added. Ground oats are good, but I like ground flaxseed best; mix it with corn before grinding, as it is very sticky to grind alone. I prefer it fed raw.

"You know, Dorothy, these biscuits of yours," he began, as he reached across the breakfast table, and helped himself to the seventh. "Yes?" said his wife, with a weary, feeble smile. "Ah! they're nothing like Mother's." "No?" And the smile was gone. "No. Not a bit. You see, Mother's were heavy and gave me dyspepsia while yours are as light as a feather, and I can eat about—why, what's the matter, Dorothy?" She had fainted.—Kate Field's Washington.

The "Cultivator" has taken some pains to get information as to the worth of beet pulp and molasses as a feed for fattening stock, because some have questioned its advisability, even going so far as to say that calves have been killed by feeding on this material, but after some little inquiry among those who have observed results, we must say that it is entirely healthy, and that no harm comes from feeding it to stock, also that it is a cheap and effective food, if it is fed intelligently. It is said to be especially valueable for pigs and calves, keeping them plump and healthy at a very low cost. Bulletin 125 issued by the department of agriculture says that molasses was used for horses as early as 1830, usually being sprinkled on dry food, first being diluted with water. At first the feed is very limited but it sometimes increases as high as thirty pounds molasses per head, but the ration usually adopted is 15 pounds molasses, 5 pounds bran, and 4 pounds corn. The bulletin estimated that this saves $45 per year per head over the ordinary fee for horses. One owner of horses who has used it more or less liberally says: "So far as I have tried it, it is all right. It takes a little time to get onto the feed—should commence light and gradually increase the molasses until they are started. Have fed in working, a part of the team on molasses and hay and the other part of the same team on hay and grain, and I do not see any difference in the condition of the animals at the end of the work. Poor stock gained much faster and shed off quicker and cleaner than on any other feed I have ever fed.

THOROUGHBRED FLOCK.

I believe every farmer, especially the small farmer, should study the possibilities in his poultry yard. Too many do not give it a thought, think it beneath their dignity or have larger ideas, so leave the poultry question all to the womenfolks.

My experience is: There is nothing pays better on the farm than a good thoroughbred flock of fowls. It pays to have a standard breed of some of the popular varieties.

And I would advise keeping only one breed, studying their characteristics and making a specialty of them.

In this way you come to know their possibilities and can feed and care for them intelligently, whereas, if you have several breeds, or a mongrel flock, there is nothing uniform, and it is impossible to grade the conditions of care, feed, etc., to the best interest of each individual fowl.

Some people do not succeed because they scatter their thoughts and energies too much, or are continually changing from one thing to another.

This is quite apt to be the case with the farmer; it is so easy and natural for him to have too many irons in the fire, in fact, there is no occupation I can think of that has so great a diversity of thought and action.

However, I believe it pays to concentrate our thoughts and energies as much as possible, and make a specialty of something, (we have chosen poultry for ours).

There is always a demand for fancy poultry and eggs at paying prices, and during some part of each year a fancy price is easily obtained.—Ex.

The Native was at the ticket window of a railroad down South, and the smart clerk was champing his bit inside because the native was so exasperatingly deliberate. "How far is it to Wahoo?" he drawled. "Forty-eight miles," snapped the clerk. "What's the price of a ticket?" "One fifty." The native began to go through his pocketbook slowly. "Come, come, hurry up, urged the clerk; "time's money on this road." "Is it?" drawled the native, laying down the price very carefully. "Yes it is." "Well," he said, hauling out the ticket; "if it doesn't make any better money than it does time, I reckon some of you is goin' to get arrested for counterfeitin' one of these days;" and he moved away, dragging his heels on the floor at every step.—Detroit Free Press.

Courtesy is to business and society what oil is to machinery. It makes things run smoothly, for it eliminates the jar and the friction and the nerve-racking noise.

BEE SUPPLIES—G. G. Wickson & Co, 123 N. Main Street, Los Angeles, Cal.

DAIRY NOTES.

The Madera skimming station has been closed.

A movement is on foot to establish a creamery at Westport, Stanislaus county. It will cost about $6,000.

The Hollister creamery has declared a dividend of ten per cent on its stock.

M. R. Williams of Beaumont has moved to Monrovia, bringing with him several head of pure bred, registered Jerseys, and last week added to his herd by buying three registered Jersey heifers from A. B. White.

Wright Bros. of Byonia are building 30-foot silos and have purchased from Wickson & Co. a feed cutter and carrier. They have over 100 cows in their dairy.

The report of the Ferndale creamery Company (Humboldt County) for the first seven months of this year a total sale of butter of 92,676 pounds at an average of nearly 27 cents per pound. The monthly production and the price is as follows:

January 2394 pounds, 32 cents; February 1671 pounds, 31½ cents; March 8873 pounds, 25½ cents; April 17,387 pounds, 22 cents; May 21,445 pounds, 24½ cents; June 20,742 pounds, 26 cents; July 20,164 pounds at an average of 26 cents. There are about six hundred cows which contribute to the creamery.

The Excelsior Creamery (Co-operative) of Ferndale, Humboldt Co., reports as follows: Gross shipments of butter: January 6114 pounds; February 5541 pounds; March 21,253 pounds; April 40,594 pounds; May 47,889 pounds; June 44,261 pounds. There are thirty-six patrons of the creamery with 1400 cows. The average price for March was 24.92 cents, April 21.41 cents; May 23.45 cents; June 24.63 cents.

POINTS FOR BUTTER MAKERS.

Hot water poured into dirty milk vessels cooks the cheesy matter and makes it gum and stick.

Rinse all vessels with cold water before scalding or steaming. This is more necessary in washing woodenware, such as churns and trays than in treating tin surfaces.

Accuracy in dealing with temperatures and cleanliness in handling milk and milk vessels will alone secure a high quality in butter or cheese. This seems so simple that many people will never try to understand how or why this is true.

In salting butter, do not salt it to suit your own taste. Be satisfied if it pleases the purchaser's palate. Make him want your butter so bad that he will part with 30 or 35 cents for every pound you send him. Much depends upon the salting of butter. Very soft butter should be highly salted to cover its many defects. Salt, like charity, covers a multitude of short-comings.—Dairy and Produce Review.

SURE:

We note the following in the Farmers' Advocate, which it says it received from a Missouri lady. We don't doubt it is a sure cure for caked bag, at the same time we would like a report from Prof. Majors of the State University as to his idea of its efficiency: "If your Cow's bag is caked Jist take a sand rock be careful and notice how it is lying on groond and take it and rub the cows bag good With the side of the stone that was down on the groond and then put it back Jist as it was in 24 hours the Cake will be all ought. I know this to be good try them. If I see this in print I Will come agin."

Every man, woman and child who has anything to do with the work of churn, ladle, package, cloth and should be cleanly and neat. Uncleanliness is the rock upon which thousands go down. It is possible to do some things in a slovenly manner and yet succeed fairly well. This is not true in buttermaking. Every pail, can, formula for powder for horse with worker must be scrupulously free from anything which will impart a taint to the finished product. The hands especially must be clean.

TWO THOUSAND POUNDS A MINUTE

A. R. Coulson Tells About the New Mixing Machine and Why It Had to Be Built.

The large mixing machine recently completed is something new and it took a long time and lots of expense to make it work. This is the best mixing machine on the Pacific Coast, and it works so well that no doubt that many of the other mills will copy after it.

This electric machine will mix a ton of feed in less than a minute, more evenly and thoroughly than a man with a shovel could mix it in half a day.

Although this great machine cost nearly $1000, it will make a great saving in labor which will make up for the cost of the machine in a few months. Where it cost $1 a ton to mix feed by hand labor this machine will mix it at a cost of 25c a ton.

It was absolutely necessary to have this machine, no matter what it cost, because the trade on balanced rations for poultry and stock was increasing so fast that they could not be made fast enough with six men working by hand labor. Besides, a machine like this one mixes it more thoroughly and satisfactorily than could be accomplished otherwise.

My enterprise is bringing me success. Not only am I successful myself, but those who follow my directions and use my poultry foods are successful too.

This is shown by the ever increasing trade on my balanced rations for poultry.

C. J. McCarthy says he has made more money out of his hens since he has been feeding Coulson's food for laying hens than ever before. He is well satisfied with Coulson's balanced rations for poultry.

D. H. Ward of Cotati has been feeding Coulson's balanced rations for about a year, and has had such splendid success and made his hens pay so well that many of the other poultrymen have gone to him to find out what he feeds to make the hens do so well. Mr. Ward recommends Coulson's balanced ration for poultry.

E. D. Callon of Fallon, who has about 5000 head of poultry, has used a number of tons of Coulson's' poultry foods and recommends it to be all right.

Geo. W. Gaston of Two Rock has 2500 laying hens which are paying him well. Mr. Gaston has fed about 300 sacks of Coulson's balanced rations for poultry and recommends it to be all right.

A. M. Shread, assistant postmaster at Jacksonville, San Joaquin county, writes: After having used Coulson's balanced ration for poultry I wish to say that it is all that it is recommended to be, and that really it is the best food that one can feed, and it is quite a saving on other food stuff, as it is richer and gives better results."

D. F. Colley at Downey, Los Angeles county, when sending for another ton of Coulson's egg food for laying hens, writes: "My hens are doing well now and I think Coulson's food is what makes them lay so, and I do not want to get out of it. The hens like it and it don't take much to fill them up, as it is a richer food. It costs me 50 cents a sack freight so make the price as cheap as possible."

L. J. Howell at Hollister has used over 100 sacks of Coulson's poultry foods and his hens are laying an average of 60 per cent, that is 60 eggs a day for each 100 hens.

Miss K. L. Richardson, an enterprising young lady at Malaga, four miles from Fresno, is making her poultry venture a success. Miss Richardson has ordered over 200 sacks of Coulson's balanced rations for poultry during the last four months.

S. W. Morgan, a breeder of fancy poultry near San Diego, has a supply of Coulson's poultry foods shipped by steamer every three or four weeks.

Many of the fancy breeders in Ventura and Los Angeles county now feed Coulson's balanced rations for poultry.

Mrs. Riley at Biggs, Butte county, orders ten or twelve sacks of Coulson's egg food at a time to be sent by freight.

Many other parties in Placer county, Toulumne county and Yolo county, order a supply to be sent by freight once a month.

Cnopius & Co., Santa Rosa, write: "Please quote us your lowest price on a full carload of Coulson's balanced ration for hens." This firm has already sold over 1000 sacks of Coulson's food.

Extracts from letters:

"We are entirely out of Coulson's egg food and Coulson's chick food and our customers are howling for it. So please see that our order goes forward at once by first freight."

"Enclosed find check for $168.70 to pay for last shipment of Coulson's egg food."

"Please ship at once to Germain Seed Co. by steamer to Los Angeles, 20 bags of Coulson's balanced ration egg food. There is quite a demand for it."

W. T. Park, of West street, one of Petaluma's progressive poultrymen, proved by actual experiment that Coulson's food for hens would make hens lay and grow feathers at the same time.

He bought from a neighbor a flock of 50 hens which were all run down. Their combs were black and they were a hard looking lot. He put them in a pen by themselves and fed them Coulson's egg and feather food and in two weeks they were all growing new feathers and over half of them were laying. Mr. Park uses Coulson's food right along.

There are hundreds of others that are using Coulson's poultry foods right along and are making a success of it.

Coulson's balanced ration for poultry is now on sale at most up-to-date feed stores, or if not, you can order from factory and have it sent by freight.

Zartman & Co. are building a new advertising wagon for Mr. Coulson. It is to cost about $125 and to have a low top and the inside is to be fitted up with shelves and a door on the end so this wagon inside will look like a little store. Charles Mills will have charge of this wagon and will take a four month's trip down in the southern part of the state as far as Mexico. Another wagon similar to this will be built for the northern country.

If you are not using Coulson's balanced ration, why not give it a trial and make more profit out of your poultry. Coulson's food will be as cheap as any other good feed and it will make your poultry give you double the returns on the cost of feed.

Ask your feed dealer for Coulson's food and don't let them sell you something else which they may say is just as good, because they want to sell you something that they can make more money on.

Remember it is Coulson's that you heard so much about, it is Coulson's that gives such good results, and it is Coulson's food that you want.

Following are a few items at random as samples from my daily mail and given here to show what people think of my poultry foods:

Hollister, Cal., July 1, 1903.

A. R. Coulson. Dear Sir: Please ship to me at your earliest convenience one carload, 350 sacks, Coulson's Egg and Feather Food. R. C. GURY.

The Western Union Telegraph Co.

Salinas, July 15, 1903.

A. R. Coulson, Petaluma, Cal.—Ship to W. J. Fair, Salinas, one carload, 350 sacks, Egg and Feather Food and 25 sacks Chick Food.

CHAS. MILES.

L. S. Butler writes from Los Gatos: "I have used half a ton of Coulson's Egg and Feather Food and like it very well. Will soon want more of it."

John Lants of Sacramento writes: "I have used Coulson's and other kinds of egg food, but Coulson's is the best."

Hollister, Cal., July 11, 1903.

To Whom it May Concern:

I, the undersigned, started to feed Coulson's Egg and Feather Food to 250 chickens which were moulting. At the end of ten days I found that my egg production was increased 50 eggs and am fully satisfied with said food.

H. A. Hall.

Hollister, Cal., July 10, 1903.

To whom it may concern:

I, the undersigned, have fed Coulson's Egg and Feather Food to my flock of poultry consisting of 1000 for six months and can cheerfully recommend the feed to any one raising poultry as a cheaper feed and an egg producing feed. Signed, W. K. Goff.

Calistoga, July 11, 1903.

A. R. Coulson—Dear Sir: Enclosed find $7.75 for which please send by freight 5 sacks more of your Egg and Feather Food for moulting hens. So far I am well pleased with results. Yours respectfully,

MRS. E. BANTA.

Santa Rosa, July 13, 1903.

A. R. Coulson—Dear Sir: I write to tell you I have been using your food for about a year and am well pleased with results. I have been keeping hens for over 20 years and never had them do as well as they have since I have used your food. Yours Respectfully, G. J. CUNNINGHAM,

D H. Ward, one of the most successful poultry raisers at Cotati, has been feeding Coulson's Egg and Feather Food for 1 year and has used about 200 sacks of it. He recommends it to all parties raising poultry as it proves to be the most satisfactory and economical of all feeds. Last winter when eggs were bringing 55 cents a dozen Mr. Ward had 500 laying hens that laid an average of nearly 250 egs a day, and were fed on Coulson's Balanced Ration Egg Food.

C. N. Davis says that by feeding his hens Coulson's Egg Food for two weeks the hens have doubled the egg supply and are moulting too.

$500 IN GOLD.

Hollister, Cal., July 9, 1903.

A. R. Coulson—Dear Sir: I send you today $500 in gold by Wells Fargo Express, money collected for Coulson's Egg Food sold at Hollister. Your respectfully, CHAS. S. MILES.

Haywards, July 22, 1903.

A. R. Coulson—Dear Sir: Enclosed find check in payment for last lot of Egg Food. Please ship at once one carload, 350 sacks, Egg and Feather Food; also 1 dozen packages condition powder, 1 dozen cans Coulson's Disinfectant, 1 dozen 50c bottles of Roup Cure.

The Egg Food is selling well here. It gives good satisfaction and we have quite a demand for it. Yours Respectfully,

Kavanagh, Shuey and Gibson.

(By telegraph.) Malaga, Fresno county, July 24, 1903.

A. R. Coulson: Ship to R. Porter, Malaga, 1 car load Egg Food.

This Feed now for sale by over one hundred stores in California. If your dealer doesn't keep it, write for prices and have it sent to you by freight.

A. R. COULSON

772-774 Main St., Petaluma, Cal. Long Distance Telephone, Black 1303

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

WOMAN'S WORK IN THE POULTRY YARD.

The following was written for a friend who wrote me, "I am glad to see by your letter that you are making strawberry jam and that you are a housekeeper as well as a poultry-keeper." Another writes, "How do you manage your work?" I think as this is purely a woman's chapter on woman's work, we will ask the men readers to skip it, and will describe

A DAY ON THE WHITE PLUME RANCH.

July 24. Rose at 5:15, set the breakfast on, oatmeal mush, shirred eggs, hot rolls, coffee, peaches and comb honey; whilst breakfast was cooking rushed out to feed brooder chicks, nine brooders, two hens and baby turkeys. After breakfast mixed feed for the fowls in the fattening coops, cleaned their feed bowls and watered them; also cleaned up under the coops. Then went to the sitting hens. They are sitting in nine barrels, all in a row in one yard, with a shade of palm branches over them. The moment I entered the yard I saw that two of the hens were sitting "light," almost standing; I knew that meant that the eggs were hatching. Carefully lifting the biddies off, I gathered the ducklings, for these eggs were from Indian Runner ducks, and not due for two days, into my apron, removing the empty egg shells and leaving those that were pipped to hatch by the next day. After filling up the feed box with corn and giving the hens fresh water, I carried the soft little ducklings into the house and proceeded to punch a hole in the web of their tender feet, so I might be sure of their pedigree when they reach maturity. I left them by the kitchen stove in my little maternity box, which has sheltered many a wee chick, duckling, turkey and guinea. It is only a little box with cotton batting at the bottom and a piece of flannel for a cover.

I went out to get the brooder ready, for, as these babies had come sooner than I expected, owing to the heat of the weather, their older brothers were still in the brooder. Although they had no artificial heat they slept in it. After cleaning and sanding it and lighting the lamp, I brought the new babies out and left them safe under the hover to sleep and grow for the first twenty-four hours.

Asking my helper if he were ready to assist me in dusting and fumigating the chicks in three of the colony houses, and finding he could help me in about twenty minutes, I ran in, cleared the breakfast table, washed dishes, gave a hasty sweeping to pantry, kitchen and porch, gave the tiny turkeys a little more food—they require little and often—and commenced a two hours' unpleasant task of looking over and cleaning the three-months-old chickens. Yes, I will confess they had some head lice and occasionally one had even a few yellow lice. It is inexcusable, I know, but if every chick on the place died, I had to leave killing lice to welcome my first little grand-daughter, and every day for the last two weeks has found me loving and admiring the prettiest and best baby girl that I have ever seen. This is for my sisters in the poultry yard!

Killing lice is no fun, but I will describe my way of doing it with chicks ten weeks old or older. I have three good sized packing cases, each capable of holding twenty-five young fowls comfortably. I spread newspapers over the bottom, paint the paper with Lee's lice killer, cover this lightly with straw to prevent the fowls soiling themselves, as mine are white, put them into the box and cover the top with canvass or old carpet. Leave them in for from two to three hours. But as I confessed my chicks had head lice, and as this interesting kind of louse has a habit of burrowing its head into the roots of the feathers, it does not always inhale the deadly vapor. In fact, one man told me he found some of these lice alive on a cockerel that he had the misfortune to suffocate in fumigating with Lee's lice killer. The cockerel succumbed to the fumes, but the lice did not. I have found that by rubbing either "buhach" or "Lambert's Death to Lice" onto the feathers of the head, the lice will come out and drop off, and wishing to make thorough work of it, I took each chick, seventy-five, held it on a newspaper on top of the aforesaid packing case. The powder was in a tin baking powder can with perforated cover. I sprinkled the powder well on the head, rubbing it in, also under the wings and around the vent, and then slipped the chick into the box where it remained from two to three hours, and emerged perfectly free from vermin.

It took me two hours to clean three colony houses of chicks.

Leaving the chicks to fumigate, I ran in, beat up a johnny-cake, set on potatoes and corn to boil, and whilst the dinner was cooking fed the baby turkeys, brooder chicks, took a look at the wee ducklings, visited the sitting hens and gathered in more little ducklings, my helper meanwhile feeding the ten breeding pens of White Plymouth Rocks and all the colony houses, ducks and turkeys.

The noon feed is green clover or alfalfa or lawn clippings, with three times a week green ground bone. Set on dinner, beefsteak, corn and potatoes, sliced cucumbers, johnny-cake and syrup and fruit. The trees in the poultry yards are loaded with great luscious plums or peaches; we and the hens have a liberal supply. The fowls enjoy the shade and take their dust baths under the trees daily.

After dinner let the chicks out of the fumigating boxes, gathered the eggs, washed dishes and straightened up and then instead of my usual nap drove over to see my grand-daughter.

Back in time for evening feed. The evening feed was a mash composed of one bucketful of boiled beans, two of bran, two of cut clover, a handful of salt, two of charcoal. This was for the hens and half-grown chicks. The baby turks had chopped onion, bread crumbs, hard-boiled egg and wheat. The ducks, one part corn meal, two parts bran, two parts cut clover, two handfuls sand.

Fed, gathered the eggs, got supper, cold meat, sliced tomatoes and cucumbers, bread and butter, honey, fruit and tea. Locked up chickens, washed dishes, and finally after dark sat down and answered about a dozen letters before retiring for the night. And so ended a busy, happy day at the White Plume Ranch.

Of course every morning is not spent killing lice, but with every morning comes work of some kind, packing and shipping eggs, crating and shipping fowls, killing and plucking. Then there is housekeeping, putting up fruit and jam and jelly making, pickling and preserving. For several years I supplied a quantity of sweet pickles jams and jellies to the Woman's Exchange, but have not for about a year. I am spending more time with my White Rocks, Indian Runner Ducks, White Holland turkeys and English Runt pigeons. Quite a large family to care for.

POULTRY NOTES.

To appear in a good condition a fowl must be perfectly healthy.

A hen is in her best condition when she is industriously at work.

One advantage, at least, with the poultry business, is that it is not subject to extremes.

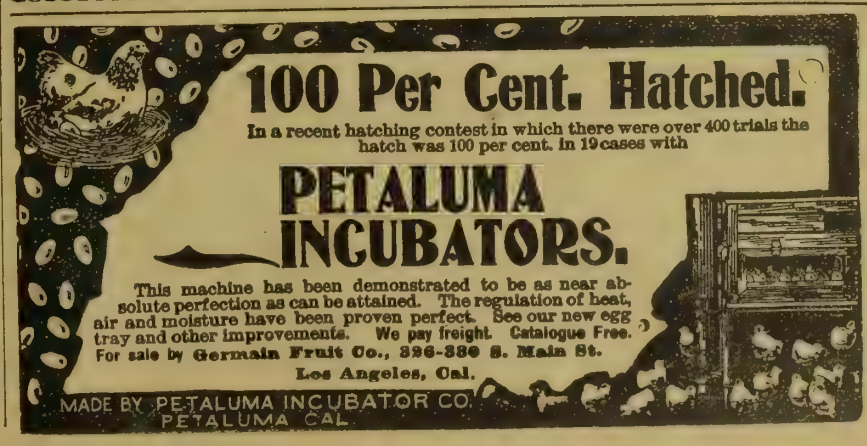
CAPTAIN MITCHELL
SANTA BARBARA, CAL.



A QUESTION OF BREED.

Editor Cultivator: What months in the year is it most advisable to hatch White Leghorn chickens, with the object in view of having winter eggs and to sell off the hens as fast as they become a year old? Is there any other breed of fowls superior to the white leghorn for this purpose and if so what is it?—N. A. C. Jacinto.

I used to keep white leghorns, standard breed, I found February, March and April the best months for hatching for late fall and winter eggs. I was not satisfied with leghorns, as the hen when her laying days are past (profitably) is too small for table use and I discarded white leghorns for white Plymouth Rocks, which I find more profitable in eggs and for market purposes. They are better winter layers than leghorns and nearly twice the weight when dressed.

[Of course this last question is a disputed one. That is, in Mrs. Basley's hands the White Rocks have proved best. Geo. Albers shows conclusively that the Black Minorca beats the world, under his management. Captain Mitchell of Santa Barbara, cannot decide, so adds to his Barred Rocks three other breeds. Likewise G. Y. Lytle of this city makes a success of White Leghorns and Rocks with White Wyandottes a strong favorite. Jacob Kreger of Anaheim sticks to White Leghorns. Petaluma, the biggest poultry center of the world runs entirely to White Leghorns. These all and many others make great success of their chosen breeds. Some with the same breeds make a failure. This, if, Mrs. Basley will pardon the editor, he would like to add that the breed of stock is not so important as the breed of man or woman who runs the yard. Study your conditions, your market, your needs, then choose the best fowl and make it a success.—Ed.]

* * *

PIGEONS.

Please let me know through the columns of the Cultivator whether wild radish seed will harm pigeons or not, also what is the trouble with pigeons when they become droopy, get awful poor and die, mostly young birds, also a remedy for this.—G. S. B., Watsonville.

The wild radish, raphanus raphanistrum, is not indigenous, but is introduced into California. It belongs to the mustard family, the Cruciferae, which is not poisonous. It may be used sparingly for pigeon and for poultry food.

I cannot diagnose your trouble without more information as to your methods of feeding and your surroundings. Something is radically wrong. The pigeons are not receiving proper care or food are affected with worms or lice and mites. Do they have salt, charcoal, grit? Plenty of fresh or running water? Clean houses? Are they closely inbred?

* * *

SQUABS.

Will you kindly answer for me through the columns of the Cultivator, relative to squabs? Is the raising of squabs for market a safe venture? How about the market for squabs? Is the demand sufficient to guarantee a ready sale?—G. G. McL., Carpinteria.

Mr. Johnson the owner of seventeen thousand pigeons at Los Angeles, the largest pigeon ranch in the world, has had no difficulty in disposing of his squabs, in fact he was not able to supply some of the largest hotels. He gets $3.00 a dozen retail or $2.50 a dozen wholesale. Consequently I infer it would be a safe venture here, but I do not know what your market would be. Personally I found raising the large English Runt pigeons in small numbers exceedingly profitable, mine have raised eight broods per year, and I would advise any one starting to have some of them as the squabs are one third heavier and larger than the common pigeon.

Unclean eggs should be washed or wiped when gathered.

Sand is not a substitute for gravel in the poultry yard. The fowls always select the extra sharp pieces.

Feathers and combs are largely a matter of fancy, but egg laying and chicken raising are matters of business.

Ground floors are best for chickens; hence there is no advantage in building the houses with two stories.—Ex.

THE PLODDER'S PETITION.

Lord, let me not be too content
With life in trifling service spent--
Make me aspire!
When days with petty cares are filled,
Let me with fleeting thoughts be thrilled
of something higher!
Help me to long for mental grace
To struggle with the commonplace
I daily find.
May little deeds not bring to fruit
A crop of little thought to suit
A shriveled mind.
I do not ask for place among
Great thinkers who have taught and sung,
And scorned to bend
Under the trifles of the hour—
I only would not lose the power
To comprehend.
—Helen Gilbert in the Independent.

DO SOMETHING FOR SOMEBODY.

Do something for somebody, somewhere,
While jogging along life's road;
Help some one to carry his burden,
And lighter will grow your load.
Do something for somebody gladly,
'T'will sweeten your every care;
In sharing the sorrows of others,
Your own are less hard to bear.
Do something for somebody, striving
To help where the way seems long;
And the homeless hearts that languish
Cheer up with a little song.
Do something for somebody always,
Whatever may be your creed;—
There's nothing on earth will help you
So much as a kindly deed.

THE OLD SURVEYOR'S STORY.

The time is not so far past as to be beyond the recollection of many persons still living, when the extension of railways through new and sparsely inhabited portions of the country was often bitterly opposed by the settlers. The law which authorized the condemnation of land for "right of way" in case of persistent failure to secure it on terms of ordinary bargain and sale, was largely responsible for this unfriendly attitude. Land owners resented what they considered as an unwarrantable trespass upon their rights in the forcible partition of their acres by the iron bands which should weld their independent freeholds with civilization upon which many of them, with the true spirit of the pioneer, had eagerly turned their backs. It followed that the men who undertook to map out the course of a prospective railroad were often viewed with suspicion or treated with open hostility.

An old surveyor, now in his restful seventies, is fond of relating among other reminiscences of early hardships and exposures, this little story:

"I was never beaten but once; and then by a woman. That was the time I got this pretty mark"—pointing to a deep, white scar beginning just over his left temple and reaching obliquely downward to the edge of the right eyebrow—"to carry about with me all the days of my life."

"We were running the line of a certain road through a cup-shaped valley between two ranges of hills. The rich bottom land was owned by the O'Shales, an Irishman and his wife, who had secured it on a squatter's claim. By rights I should have put the wife first, for this was surely a case where 'the gray mare was the better horse.' Mrs. O'Shale was tall and straight, a powerful figure of a woman, with strong, masculine features, snapping black eyes, and a splendid shock of hair of the same color.

"From the first she was determined that the road should not cross her farm. No other route, however, could possibly be considered, since to go around it meant tunneling through the hills. Considerable time was consumed in vain attempts to effect a conciliation, before the officers of the company in despair determined to take advantage of their legal privileges, and I was directed to proceed with my work.

"Then began a series of annoyances. Our stakes were repeatedly pulled up and their marks obliterated; the packhorses picketed near our camp were mysteriously set loose at night; once a valuable instrument was tampered with. In the end we were forced to detail one of our party as watch while the others slept.

"One morning O'Shale and his son, a well-grown lad of 18, carried their rifles to the field where we were to operate. As we were about scaling the rail fence, the old man called out to us, "Don't come over! If you do, we'll shoot!'

" 'Pshaw! you wouldn't shoot a man in cold blood?' I answered, at the same time throwing a leg over the rail, 'let's talk it over!'

" 'Not a worrd, sorr!" blustered O'Shale, whom, notwithstanding his apparent boldness I knew to be an arrant coward. 'Step yer fut on the ground at yer peril!'

" 'Wait a minute!' I rejoined, following up my advantage with the other leg, while my companions cautiously imitated my example. By dint of continual talk and almost imperceptible advances we finally succeeded in approaching near enough to rush, at a concerted signal, upon the men and disarm them, after which we proceeded with our measurements amid a fusilade of harmless abuse.

"The next day, on returning at evening from a side expedition, we found that our camp had burned. Blankets, supplies, cooking equipage and some papers and instruments were all a heap of smoking ashes. Of course we had no absolute proof of foul play. A spark from our own breakfast fire might possibly have started the blaze, yet we could scarcely doubt that the catastrophe was only another move in the O'Shale campaign of hindrances.

BROWNSBERGER HOME SCHOOL
STENOGRAPHIC BOOKKEEPING
AND CLASSICAL COLLEGE PREPARATORY DEPTS.
953-955-957 West Seventh St., Los Angeles, Cal.
Pleasant study in the midst of the most beautiful home-like surroundings. Day and evening sessions. Shorthand made easy by famous "Chalk Talks" by the Principal. Machine at home free of charge. Spanish at lowest rates. Every graduate in a position. Ten teachers. Largest capacity in the city. The Bookkeeping is the famous Bridget System. Classical College Preparatory Dept. fits for State University. Send for illustrated Catalogue. FLORIDA BROWNSBERGER, Principal.

SOUTHERN PACIFIC
CHOICE OF 3 ROUTES
EAST AND WEST
"SUNSET" Via El Paso and New Orleans
"OGDEN" Via San Francisco and Portland
"SHASTA"
The service on these trains is perfect. The time is the fastest. The scenery most beautiful. The tourist car service appeals most directly to those who desire to travel at a high rate of speed, but prefer to economize a little on sleeping car accommodations The Southern Pacific runs personally conducted tourist excursions every day in the week at reduced rates to various points in the east, without change, via all routes. A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.
SOUTHERN PACIFIC
261 SOUTH SPRING ST.

"Application at the farm house for temporary shelter and food met with an unqualified refusal.

" 'An' is it milluk ye're wantin'?' cried Mrs O'Shale, barring the doorway with her muscular figure and brandishing a stewpan by way of emphasis. 'Sure, an' it's the nerrve that ye have wid ye! Whin onst ye'd git yer ingines schreechin' acrost the fields, it's not a milluk-givin' crathure that'd be left on the place at all, at all! Didn't me cousin Kelpie tell me as how ivéry one o' her cows wint dry o' fright whin the railroad was opened through the pasture? Bad 'cess to it! An' eggs?? Hear the mon! Cousin Kelpie's Black Spanish fowls, a dozen of 'em, sailed squawkin' over the barnyard fence for all the worrld like a flock of aigles, an' away they went into the woods where the skunks an' the weasles made short work of 'em! An' two o' her suckin' pigs, the innocent craythurs, crawled under the fince an' was run over in the same day, let alone a lamb that straggled through the gap. No, sor! ye can go back fastin' to the place where ye came from, for it's not a bite o vittles that ye'll be gittin' from Bridget O'Shale!' and she banged the door in our faces.

"The situation was serious. A half dozen tired and hungry men, and the next farmhouse five miles away! Suddenly one of us made a fortunate discovery. From the heart of the ash heap was drawn forth a joint of jerked beef roasted to a cinder on the outside, but still containing an eatable remnant within. The tough and blackened morsel was divided into equal portions, with which we were obliged to content ourselves before lying down to sleep on the bare ground. Next morning we set off breakfastless to recruit our supplies.

"But there was more trouble in store for us. Our line must rightly not only bisect the farm but pass directly through the house itself. Here, however, the law in the case was favorable to the occupants. Landed property might be forcibly appropriated and appraised, but an inhabited house was inviolable. At last, after much vexations and expensive delay, the company directed me to yield the point and run a second line on a curve around the cabin.

"This was but just completed, when, almost with the swiftness of Aladdin's castle, a rough shanty rose under Mrs. O'Shale's direction directly upon the new line. She sent for a married son and his wife, and placing them in charge of the homestead, removed her immediate family with a few necessary goods and chattels into the temporary structure and set up housekeeping there.

"This was 'the last straw.' Determining to take the law into my own hands and risk the consequences, I warned my resourceful enemy to move out of the shanty within 24 hours on pain of having it pulled down over her head. This action was all the more necessary since the construction crew was already within a few miles of us. She obstinately and defiantly refused, she declared. 'I've heard tell that an house where I like upon me own land!' she declared. 'I'ce heard tell that an Englishman's house is his castle, an' by the same sign an Irishwoman's is her'n in this free land of Amerikey!'

"She was just bringing a pitcher of water from the spring when I ordered my men to begin the work of demolition. Turning with a really superb motion, she stood in the rude doorway like some wild creature at bay, while the roof boards began to clatter upon the ground. I shall never forget her looks. Her whole body seemed to dilate, her long, black hair broke from its comb and streamed down her shoulders, and her eyes shone like two fires. She tried vainly to speak, but anger choker her and no articulate words came to her relief. With a swift, unpremeditated movement she raised her powerful arm and flung the earthen pitcher with unerring aim full into my face. I sank to the ground unconscious, with the blood streaming from a jagged wound in my forehead.

"I was taken up for dead, but finding that life still remained, my men managed with great difficulty to convey me to the nearest town, where I lay for a long time in the hospital.

"My life had hung so critically in the balance that Mrs. O'Shale, thoroughly frightened lest she might have to answer the charge of murder, had yielded every point in dispute with commendable meekness.

"Oddly enough, I found it difficult to harbor any lasting resentment against the woman who had brought me so near to my death. Much might be pardoned an ignorant, untrained creature who had lived through the cruel evictions of her native island, and having established herself after incredible hardships in a 'free country,' now believed her rights a second time invaded.

"After my recovery, I was called to a distant state, and only ten years later returned to pay a visit to the scene of my unfortunate experiences.

"So rapid had been the development of the country that I found it not easy to recognize familiar landmarks. Growing crops waved where forests had stood unbroken, and prosperous-looking houses and barns dotted the landscape.

"I left the train at a tidy little station, where the station master stood upon the platform apparently in the role of a hospitable host. He was a good-looking fellow, whose features seemed unaccountably familiar. The clew which my own memory would doubtless soon have supplied was given by a fellow passenger who alighted with me.

" 'Hullo, O'Shale!' said he, 'anything doing?'

"I gave the master a frank stare and then held out my hand. "Michael,' said I, 'have you forgotten Singleton?' I hope you and your father haven't any guns waiting for me this time.'

"The young man stared, looked keenly into my face, and blushed under his tan.

" 'Mr. Singleton,' he answered, 'this is mighty unexpected. But I'm glad to see you indeed, and'—he hesitated and stammered—'if you'll let by-gones, be by-gones, and do us the honor to call, my father and mother will be proud of your kindness.'

" 'Why, certainly! That's my errand here.'

" 'I wish I could take you over, but I can't leave the office. The up-train is due in 20 minutes. But the house is right over there beyond that grove of trees—the white one with green blinds. You can't miss it.'

"I could hardly believe my eyes. Could yonder large and commodious dwelling with its clustering outbuildings have replaced the log cabin and the shanty.

"Mrs. O'Shale herself answered my knock. Her black hair showed threads of silver, her dress was neat and becoming and her whole expression had softened. She recognized me instantly.

" 'The saints be praised!' she exclaimed. 'If it ain't Mr. Singleton himself! Many's the time, sorr, that I've prayed for this day. Me sin's laid heavy on me soul. O Lord, forgive me! is that me wurrk?' she screamed, as the removal of my hat discovered the scar. 'And all the time ye an' yer company was the best friends we had, if we'd but known. The worth o' the land's mor'n doubled since the railroad come through. Pat sold off a ten-acre lot the ither day for more money than the hull farm would 'ave brought when you was here. We've got the house an' the barns, an' a snug bit o' money in the bank, an' it's the foine wages entirely that Mike do be gettin' at the station. Ah! but it's meself as was a wicked fool! Mr. Singleton, I want to hear ye say that ye don't bear no ill will.'

" 'Not a bit, Mrs. O'Shale!' I answered with hearty truthfulness. 'And now I wonder if I could have the glass of milk I asked for so long ago! Or are your cows all dry, and your hens all flown away to the weasels?'

" 'Ah, Mr. Singleton! Git along wid ye for makin' game of a poor owld woman! Come inside and set down in the armchair whilst I blow the horn for Pat. Ha's hoein' over there in the potater patch. Set ye down, I say, till I do be puttin' on the tay-kettle.' "—Orange Judd Farmer.

No stream from
Its source flows seaward,
How lonely so-ever its course,
But some land is gladdened.
No star ever rose and set
Without influence somewhere,
And no life can be pure in its purpose,
And strong in its strife,
And all life not be purer and stronger thereby.

—Owen Meredith.

Glasses will not become clear if put into hot water when milky.

HINTS ON JELLY MAKING.

To extract the juice, place fruit in the kettle with just enough water to keep from burning, stir often and let remain on the fire until thoroughly scalded; or a better but rather slower method is to place it in a stone jar set within a kettle of tepid water, boil until the fruit is well softened, stirring frequently, and then strain a small quantity at a time through a strong coarse flannel or cotton bag wrung out of hot water, after which let it drain, and squeeze it with the hands as it cools, emptying the bag and rinsing it off each time it is used.

The larger fruits, such as apples and quinces, should be cut in pieces, cores removed if at all defective, water added to just cover them, boil gently until tender, turned into a bag and placed to drain for three or four hours or over night. Make not over two or three pints of jelly at a time, as larger quantities require longer boiling.

As a general rule, allow equal measures, sugar and juice. Boil juice rapidly ten minutes from the first moment of boiling, skim, add sugar, and boil ten minutes longer; or spread the sugar in a large dripping pan, set in the oven, stir often to prevent burning, boil the juice just twenty minutes, add the hot sugar, let boil up once, and pour into the jelly glasses immediately, as a thin skin forms over the surface which keeps out the air; cool quickly and set in a dry, cool, dark place.

Jelly should be examined toward the end of summer, and if there are any signs of fermentation, reboil.

Jelly needs more attention in damp, rainy seasons. To test jelly, drop a little in a glass of cold water, and if it immediately falls to the bottom, it is done, or drop in a saucer, and set on ice, or in a cool place; if it does not spread, but remains rounded, it is finished.

Some strain through the bag into the glasses, but this involves waste, and if skimming is carefully done it is not necessary. A little butter or lard rubbed on the outside of glasses or cans will enable one to pour in the boiling fruit or liquid, the first spoon or two slowly, without breaking the glass.

If jelly is not very firm, let it stand in the sun covered with window glass or pieces of mosquito netting for a few days. Never attempt to make jelly in damp or cloudy weather if firmness and clearness are desired.

Use a wooden or silver spoon to stir, dip with earthen cup, and cook in a porcelain-lined kettle.

Currants and berries should be made up as soon as picked; never let them stand over night.

When ready to put away, cover with pieces of tissue paper cut to fit and closely pressed upon the jelly, and put on the lid or cover with thick paper, brushed on the inside with the white of an egg, and turned down on the outside of the glass.

* * *

In making fig jam use ¾ of a pound of sugar to one of fruit after it is pealed and washed.

JELLY STOCK FROM CRAB APPLES.

Jelly Stock From Crab Apples.—Take three quarts of crab apples—not too sweet—add water till you can see it around the sides of the vessel and cook till soft. Use only the juice that will drain off through a colander as squeezing the fruit makes the jelly cloudy. Add the juice from three boxes of raspberries or strawberries which has been cooked and strained, and proceed as in any jelly making. This makes a delicious and also economical jelly. The pulp of the crab apples, if not crushed in the draining off the first juice for the jelly, will make good apple sauce.

HOMELY HINTS.

The best way to remove the charcoal from the bottom of your burned cake is to scrape it off with a grater.

The easiest way to clean a coffee pot is to boil in it water containing soda.

If you put lye into the water you soak your saucepans with, you will have no trouble washing it the next morning.

Soap suds take the new look from silver.

Windows will never be clear again if washed when the sun is shining directly on them.

Tissue paper is the best to polish mirrors.

SOUTHERN REFINING CO.

P. O. Box 9, Station C. Los Angeles, Cal.

San Francisco Markets.

Dairy.

San Francisco, Aug. 13.

Butter is proving a disappointment not only to the producer but to the speculator who invested heavily in April and May at 21 to 25 cents, and placed in cold storage for the regular summer rise in price. The market held up in those months some three or four cents higher than last year but the speculation in the past had always proved so profitable that it was all picked up at the big spring prices. This year, however, the big spring prices encouraged early shipments from the East, which were of such volume that the summer market has been held far below that of the past. Hence disappointment on the part of speculators and incidentally, this time, on the part of the producers.

Quotations are.

BUTTER—Per lb:

Creamery, extras	.25	@25½
Creamery, firsts	.24	@24½
Creamery, seconds	.22	@23
Dairy, extras	.22	@23
Dairy firsts	.20	@21

Eggs and Poultry.

Eggs seem to be holding the same prices during the week. Best quoted at 27 and 28 cents. Some large purchases have been made in the country for prices as low as 25 cents. The Santa Rosa auction plan by which the eggs are sold at home to the highest bidder is being considered by the Petaluma people and may result in its adoption there. Quotations are:

EGGS—Per doz:

Ranch, selected, large	.27	@28
Ranch, good to choice	.25	@26
Store	.19	@22
Eastern	.18	@21

Fruits and Vegetables.

Strawberries seem to be much lighter in receipt than last week, with consequent stiffening of prices and firming of markets. Blackberries are in sufficient supply and keep the prices low, and sales rather slow. Deciduous fruit is coming in in large quantities, and as a rule in excelent quality. Bartlett pears are arriving freely. Strictly fancy fruit is a very small proportion of the receipt. It commands the highest quotations, and is quickly cleaned up. "Mediums" seem to be a drag in the market. Grapes are now coming in from all sections, and the demand seems to keep pace with the supply. Prices have a wide range; some sweet water grapes from Martinez sold at $1.00 per box. Watermelons are now plentiful, and at much lower prices. Maximum quotations given below are only for the very fancy stock. Cantaloupes and nutmegs are in heavy supply, and usually sold below quotations. Peaches are in heavy receipt, much of the fruit being overripe for good sales.

There are few changes in the prices of vegetables; the fancy stock commanding slightly higer prices than last week. Tomatoes are in moderate supply, with liberal demand for best grades. Green corn sells quickly at quotations.

DECIDUOUS FRUITS.—Apples, per box, common to choice, 40@80c; fancy, $1@1.10; Crabapples, per box, 30@65c.

PEACHES—Per box, 25@60; basket, 20@35c; bulk, per ton, Freestones, $15@20; Clingstones $15@25.

PEARS—Per box, No. 1 Bartlett, 75c@1.10; common, 25@60; bulk, per ton, $20@40; other varieties, per box, 30@60c.

PLUMS—Per box or crate, 35@85c, as to variety.

FIGS—Per box, $1@1.25 for small and $1.75 @2 for large boxes.

APRICOTS—Per box, 40@50c.

CANTALOUPES—Per crate, 75c@$1.75.

NUTMEG MELONS—Per box, 30@50c.

WATERMELONS—Per 100, $5@15.

GRAPES—Per box or crate: Seedless, 50c@ $1; Black, 50@90c; Fontainbleau, 50@75c; Tokay, 65@75c; Sweet water, $1.

BERRIES—Per chest: Strawberries: Large varieties, $3@4.50; Blackberries, $2@3.50; Raspberries, $4@6; Huckleberries, per lb., 6@8c.

TROPICAL FRUITS—Bananas, per bunch, Hawaiian, 75c@$1.50; Bluefields, $1@2.50; Pineapples, per doz., $1@2; Dates, Fard, per lb., 7@9c; do, Persian, 6@6½c.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, $1.50@3, as to quality. Valencias, $2@$3; St. Michaels, $2@3; Seedlings and Mediterranean Sweets, $1@1.50; Lemons, 75c @2.50; Grape Fruit, $1@2; Limes, $4@4.50.

Dried Fruits, Nuts, Etc.

There is very little trading in Dried Fruits and prices remain unchanged.

DRIED FRUITS—Prices for carload lots f. o. b. at California common shipping points, in bags for 1902 crop, are, per lb., as follows:

Apples—Evaporated, 5@6½c; Sun Dried, 3@ 4c.

Apricots—Royal, choice to fancy, new, 6¾ @9c; old, 6½@7c; Moorparks, choice, 9@10c.

Apricots—Royal, choice to fancy, new, 6¾ @8c; old, 6½@7c; Moorparks, choice, nominal:

Peaches—4¼@6½c.

Pears—4¾@9½c.

Plums—Pitted, 4½@6c; unpitted, 1@1½c.

Nectarines—Whites, 4@5½c.

Figs—White, 5½@6c; Black, 5c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1902 crop: Loose Muscatels, 50-lb boxes, per lb., 2-crown, 5½c; 3-crown, 5¾c; 4-crown, 6c; Seedless, loose Muscatels, 5c; London Layers, 20-lb boxes, per box, 2-crown, $1.40; 3-crown, $1.50; fancy clusters, 4-crown, $2; Dehesa, 5-crown, $2.50; Imperials, 6-crown, $3. These prices are subject to change without notice. Seeded, f. o. b. at Fresno, per lb.: Fancy, 16 7¾c; 12 oz., 6¼c; bulk, 7½c; choice, 16 oz., 7½c; 12 oz., 6c; bulk, 7¼c.

NUTS.—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Pecans, 11@12c; Peanuts, Eastern, 5½@6c; do, California, 5@ 6c; California Walnuts, soft shells, 12@13c; Chestnuts, Italian, nominal.

HONEY—New Comb, White per lb., 13@14c Light Amber, 12½@13c; Extracted Water White, 6@6½c; Light Amber, 5½@6c; Dark Amber, nominal.

BEESWAX—Per lb., 32c.

Live Stock.

There has been no change in the live stock market other than hogs are slightly off. There are liberal stocks on hand and the market is lively.

Quotations are:

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 7@7½c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@8½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES.—Light, per lb., 6@5½c, gross weight; heavy, 4½@4¾c, gross weight.

SHEEP—Per lb.: Fat Wethers, No. 1, 4@ 4¼c, gross weight; Ewes, No. 1, 3¾@4c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb. live weight.

HOGS—Per lb.: Hard grain fed, weighing alive 140 lbs and over, 6@6¼c; weighing under 130 lbs, 5¾@6c; weighing 260 to 350 lbs, 5½ @6c; rough heavy, 4½@5c.

Hay and Feed Stuffs.

HAY—Prices on new Hay, per ton: Wheat, $11@14; Wheat and Oat, $10.50@12.50; Oat, $8.50@12.50; Barley, $8.50@11; Clover, $8@10; Alfalfa, $9@10.50; Stock, $8@9.

falfa, $9@10.50; Stock, $8@9.

STRAW—Good to choice, per bale, 45@60c.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

FEED CORN MEAL—Choice grades, per ton, $33.50@34.50.

GROUND BARLEY—Per ton, $23@24.

MIDDLINGS—Per ton, $28@30.

BRAN—Per ton, $24.50@25.50.

CRACKED CORN—Choice quality, per ton, $34.50@35.50.

BEANS—Prices per ctl: Large Whites, $2.90 @3.10; small do, $3@3.30; Peas, $3.30@3.50; Lima, $3.40@3.55; Red, $2.90@3; Pink, $3@3.10; Bayo, $3.50@3.70; Blackeyes, $2.75@3; Red Kidneys, nominal.

Cereals.

FLOUR—Net Cash, Family Extras, $4.60@ 4 85 per bbl.; Bakers' Extras, $4.40@4.60; Oregon and Washington, $3.90@4.40.

WHEAT—New Crop: No. 1 Shipping, per ctl, $1.46¼; choice, $1.48¾; White Milling, good to choice, $1.52½@1.62½.

BARLEY—New Crop: Choice, No. 1 Feed, $1,03¾@1.06¼; Shipping, $1.10@1.17½; Brewing, No. 1, $1.17½@1 20; Chevalier, nominal.

CORN—Good to choice, per ctl: California, new large Yellow, $1.57½@1.62½; small do, $1.75@1.77½; White, $1.55@1.62½.

OATS—Feed, good to choice White, $1.22½@ $1.32½; White Milling, $1.32½@1.37½; Red, $1.15@1.30; Black, $1.12½@1.20 for Feed and $1.25@1.35 for seed.

RYE—Good to choice, per ctl., $1.20@1.25.

Hops.

The prices for new crop are 18 @20c per lb, according to quality.

Eastern Markets.

New York General Market.

CHICAGO, Aug. 12.—Trading in wheat today was fairly active, and the general sentiment was inclined to the bull side under the influence of continued light receipts and a better cash and export demand. The opening was somewhat irregular, the distant deliveries being steady to firm, while the September option was easier as a result of lower cables. September was off ⅛ to ¼ at the start, opening at 79¾@79⅞, selling up early to 80¼@80⅜. The advance was due mainly to active demand for December and May, with but little on the market. On the advances there was realizing in all months, but the feature was the heavy liquidation of September, which resulted in that month declining to 79½. Notwithstanding the large amount thrown on the market, the declines were only temporary, reactions occurring whenever the selling had ceased. The strength in corn was a help in advancing prices late in the day, and caused a firm close, September being up ¼ to ⅜ at 80¼@80⅜. The sentiment in the corn pit was decidedly bullish on the cold weather throughout the corn section, snow being reported at Omaha. The close was at the top figures, September being ¾ higher, at 52⅞. There was only a moderate trade in oats, but prices were firm throughout the day, due partly to the strength in corn and partly to the lack of offerings. September closed ⅝ higher, at 34⅞. A liberal run of hogs and easier prices at the yards caused lower prices in provisions. Trading was extremely quiet, and the market showed little fluctuation.

Cash quotations were as follows: Flour was steady; No. 2 spring wheat, 82@83; No. 3, 77@ 81; No. 2 red, 78¼@79¾; No. 2 corn, 52⅝@53; No. 2 yellow, 53⅝; No. 2 oats, 35¼; No. 3 white, 34¾@36; No. 2 rye, 51¾@53; fair to choice malting barley, 47@53.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	31,400	8,700
Wheat, bushels	377,500	30,700
Corn, "	214,200	234,000
Oats, "	391,500	151,000
Rye,	12,900	4,300
Barley, "	14,300	800

On the Produce Exchange today the butter market was firm; creamery, 14@19; dairy, 13 @17; eggs, firm, 12@15; cheese, steady, 10½@ 11¾.

Chicago Live Stock.

CHICAGO, Aug. 12.—Cattle -Receipts, 19,-000, including 2000 Texans; with best grades steady; others slow; good to prime steers, 5.00@5.45; poor to medium, 3.60@4.80; stockers and feeders, 2.50@4.25; cows, 1.50@ 4.50; heifers, 2.00@4.75; canners, 1.50@2.70, bulls, 2.00@4.25; calves, 2.50@6.75; Texas fed steers, 3.25@4.50; western steers, 3.50@4.25. Hogs—Receipts, today, 37,000; tomorrow, 25,-000; left over, 3000; market mostly 10c lower; mixed and butchers, 5.10@5.75; good to choice heavy, 5.45@5.65; rough heavy, 5.00@5.40, light, 5.40@5.75; bulk of sales, 5.30@5.50. Sheep—Receipts, 15,000; sheep and lambs steady; good to choice wethers, 3.25@3.75; fair

to choice mixed, 2.50@3.25; western sheep, 2.75@3.60; native lambs, 3.25@6.00; western lambs, 4.30@5.65.

California Dried Fruits.

NEW YORK, Aug. 12.—The market for evaporated apples is quiet, but steady. Common, 4¾@5½. Prime, 5¾@6; choice, 6¼@6½; fancy, 6¾@7½. Prunes steady to firm. Quotations range from 3@7 for all grades. Apricots continue firm; new crop, choice, 9½; old crop, 9@9¾ for choice and 10 for fancy. Peaches are dull and unchanged at 7@7½ for choice and 8@10½ for fancy.

CITRUS MARKETS

ORANGE MARKET.

The week has shown somewhat heavier arrivals at auctions and easier prices, not only on account of oranges being more plentiful, but other fruits are on the markets in large quantities. There has been a decline of 35 to 50 cents per box. Markets are not in strong tone.

Western markets are showing a fair amount of activity and taking good stock at satisfactory prices. The market generally being fairly well cleaned up under the lighter shipments that have been going forward, and conditions are favorable.

LEMON MARKET.

Lemons continue to drag, western dealers being unable to use them except in very limited quantities, and anything diverted to auction points meeting with disastrous results, especially when showing quite heavy decay. The weather continues cool and unfavorable for lemons and prospects are for low prices, even for limited shipments at present, only good keeping stock wanted. Weak, decaying stock will not bring expenses.

AUCTION SALES.

NEW YORK, AUGUST 6.

A. C. G. Fr. Ex., Stag Valencias, $4.20. Pointer, $3.15. Hunter, $2.35.

NEW ORLEANS, AUGUST 11.

Market steady.
D. M. Fr. Ex., Violet Valencias, $3.15.

Shipments for season ending August 10, 21,383, of which 2,438 were lemons. Shipments for last season, same date, 16,822, of which 1469 were lemons.

A fearful railroad wreck occurred in Michigan last week in which the Wallace Bros. Circus was wrecked and many of the employees killed.

The crowning of Pope Pius X occurred at Rome last Sunday amidst the geratest splendor and pomp.

Kansas suffered another terrible tornado last week, two being killed and a vast number injured.

Lieutenant General Nelson A. Miles has relinquished the command of the United States army. Lieutenant General S. B. M. Young is now in command.

BUSINESS NOTES.

The recent invention of the beet puller, of the Killefer-Griffith Mfg. Co., of Los Angeles, has proved an entire success in the fields about Oxnard and Salinas. This puller is manufactured for the purpose of loosening two rows of beets at one time, and requires slightly more power than the one for lifting one row at a time. It has been tried in hard ground as well as in sandy, and has been found to stand the test, and it has proved a complete success with far less draft than anticipated. The Killefer-Griffith people believe in putting up a machine which will stand the work which it has to do.

* * *

As a pointer as to what advertising will do, A. R. Coulson writes us that he is selling more chick and poultry food than he can possibly supply. This is notwithstanding his new machinery and improved mixtures, which he recently established.

* * *

Mr. Rogers says that the Tilton cot is the very best canning variety of that fruit, as it remains very firm when peeled and cooked and has an excellent flavor peculiar to its variety alone. In drying, the fruit is a dark yellow color at the pit, giving it an appearance very tempting when packed and the fruit is much desired by packing house men.—Hanford Journal.

Surf Bathing

Ever try it? The first plunge in the surf makes you catch your breath, but the fun you have after you're in, its indescribable. It's one of the pleasures that can be indulged in every day in the year at Terminal Island. Temperature of water always the same. New bathing suits at the bath house. Private retiring room for ladies. Hotels all open. The

The Combination of Orchard and Dairy

As a rule the production of lemons has been considered as in a class by itself, and the production of milk as in a class by itself, and each located in sections which give best returns for that line. Of course, this must be true within certain limits, that is, we cannot raise lemons in a low, pasture land, which is supposed to be best adapted for the most economical returns in dairying. Neither may we with greatest economy conduct a dairy on a sandy loam of the frostless uplands where lemons are supposed to secure best returns for their owners. But that there may possibly be a merging of the two lines of business, under such conditions that both are benefitted and made more profitable, we believe is being proved in California today.

To be sure, the most economical product of feed for the dairy must be in the rich lands where the water is abundant and cheap; but by little economy and intensive farming, root-crops, and corn may be raised between young orchard trees which aid materially in the production of a rich flow of milk.

We have heard it said that with fertilizer at the price usually charged for it, if dairy stock will support itself by a direct product, the waste material alone would furnish abundant profit for the orchardist who will grow the largest and best crops. For instance, bran which costs $20 to $25 per ton, has more than one- half of its value thrown upon the manure pile.

This combination of dairying and orcharding is not common, but believing it has points worthy of consideration we write this week of one experiment which is working out successfully.

With the number of lemons in Southern California being rebudded to oranges it is gratifying occasionally to come in contact with those who are making a success of the lemon. Several cases where success is being made have been mentioned in the Cultivator, and it now proposes to refer in a few words to one orchard from which some of the finest fruit in Southern California has been shipped. This has been made to a certain extent possible by the manufacture of manure on the ranch by the above mentioned plan and has resulted in giving it an enviable reputation, and as well has resulted in desirable returns to the owner. The orchard referred to is that on the Leffingwell ranch, of Whittier, of which C. W. Leffingwell, Jr., is the manager. This orchard comprises about 500 acres of land, on part of it being 20,000 citrus trees, of which not far from 15,000 are lemons, almost entirely of the Eureka variety. The Villa Franca are also planted, but it is not so great a favorite as the Eureka.

It was the pleasure of a Cultivator representative to make a visit to this ranch this week, and to inspect Mr. Leffingwell's method of handling his orchard and of handling the fruit in the packing house. The orchard is on a rather heavy soil, but it is a soil which requires but little irrigation, if given good care. Up to this time this year it has had but one irrigation, and the general appearance of the trees is such that there is no question, but they have had an abundance of water. The foreman, F. W. Gray, gave us something of an idea of the manner of irrigation.

The water for irrigation is supplied from one well, about 300 feet deep. The lift is 100 feet but this is readily accomplished and the quantity of water needed is supplied by a powerful pumping plant. The furrows, of which there is only one on each side of the row of trees, are made as deeply as possible with a large furrowing shovel, which, in the irrigation given this year, was followed by a sub-soil plow, which broke up the soil and the "plow sole" to a further depth of six or eight inches.

The next irrigation will be handled somewhat differently. The sub-soiler will be used to cross the orchard at an angle with the flow of water, then as the water trickles down one furrow it is caught by these cross furrows and all the soil between the furrows on either side of the trees is thoroughly soaked. This method has been proved successful by excavation in the soil which showed that the water reached nearly all parts of the ground. The cultivation which followed the irrigation was both deep and thorough, and a perfect mulch of dry dust is kept on top of the moist soil.

At the time of the visit there were two power-spraying outfits at work applying a two and oe-half per cent. solution of distillate spray. This spray has proved so eminently satisfactory that Mr. Leffingwell champions its cause as the best method of controlling the black scale. One thing is sure, the part of the orchard which had been sprayed for several days showed the immediate results of the spraying to be beneficial, in this, that the smut which before covered the leaves, rattled off at the brushing of the trees, or even from the rustling of the wind. The two spraying outfits are each manned by two Japanese workmen, and are kept supplied constantly with water and distillate by one wagon.

The lemons are all cut to size, each picker being supplied with a ring, which gives in the packing house a remarkably uniform size of lemons.

The method of handling the lemons is that followed by the Limoniera ranch at Santa Paula, and gives results that are truly remarkable. Lee Williams, foreman of the packing house, informed us that he could handle November lemons so that the following June they would be as bright and fresh as any market would demand, and the per cent. of decay in that length of time has not been to exceed one-fortieth of one per cent. This he says he is enabled to do by this tent method.

The fruit as it comes from the orchard is at once placed through the washer. The method of handling the fruit is to dump it in a long and deep vat of water, from which an automatic feeder lifts the fruit to the tables of the power washer propelled by an electric motor. The fruit is constantly dumped in the vat at the end farthest from the machine, and by the time it reaches the brushes it has the smut and dirt thoroughly loosened, so that nearly all the fruit comes out perfectly bright and clean. It passes from the brusher to the endless carrier, and from that to the trays which are on a level with it. There is absolutely no falling or bumping around of the fruit, neither in this machine or in any other part of the packing house. This extreme care of handling is one occasion for the slight percentage of loss in the packing house. How this slight loss can be continued in the refrigerator cars, and in the eastern markets, is a question which our lemon people would like to solve. As yet it seems impossible to give the fruit this care after it leaves the California packing house.

At the side of the trays, after the fruit is delivered from the endless carrier, stand the workmen who give the first grading of the fruit. This is determined by the color or degree of ripeness. If the fruit is wished for immediate shipment, it is placed in the sweat room, where a temperature of 90 to 92 degrees is maintained day and night for about six or seven days. The object of this is to hasten the coloring of the green fruit and to make it ready for immediate marketing. The effect upon the keeping quality of the fruit is not in the least injurious, the only point which is regretted at all, is that most of the stems drop from the fruit, giving it something of the appearance of the "drops," but the trade readily understands this, and there is no decay, such as comes from the fruit pulled from the trees.

If the fruit is not wanted for immediate shipment, the different grades of colors are placed in their respective tents, and enclosed by drawing the tent down on all sides. Then begins the eternal watchfulness, which is necessary to keep just the amount of moisture necessary to prevent the fruit from wilting, and not enough to encourage the growth of the rot fungus. It seems that temperature has but slight effect upon the keeping of the fruit, but that moisture has all to do with it.

When ready for market the fruit is

INSTITUTES.

Since the dates given in our last issue of the Southern California Institutes, there have been some changes made which may be noted in the corrected lists given below. We may first say that in Northern and Central California the dates have not as yet been arranged, at least only one, which is at Pacific Grove, Monterey county, on August 26 and 27. This will be conducted by D. T. Fowler, who has charge of all the Northern California Institutes. Regarding these Institutes, Superintendent E. J. Wickson writes: "We do not find it desirable to do much in September and so will begin very soon and canvass to fix dates in the following months according to the wishes of the localities. You can say, however, if you desire to make an item on the subject, that correspondence is requested from all localities and that we would like to have a statement of the week or month which is most acceptable and will try and make appointments so far as possible to meet local desires."

Regarding the dates of the Southern California Institutes, Prof. Cook furnishes the following: Goleta, August 28-29: Carpinteria, August 31 and September 1; Ventura, September 2-3; Fillmore, September 4-5; Fernando, September 7; Tropico, September 8; San Dimas, September 9-10; and Upland September 11-12.

LOS ANGELES POULTRY SHOW.

The Los Angeles County Poultry Association makes definite announcement that it has secured Hazard's Pavilion, and will hold a poultry show on December 7-12, and plans are laid for good t..ings this year to make up for no show last year. The members of the Board of Directors are: Henry Albers, Eugene Germain, Chas. T. Paul, S. R. Kellam, Harry E Rose, George Pomeroy and Henry W. Kruckeberg.

These men take hold of the movement thus early with a vim which promises complete success of this exhibition. Hazard's Pavilion is the biggest show room in Southern California, and is admirably lighted and adapted for big shows. H. W. Kruckeberg is secretary of the association.

WELCOME G. A. R.

The veteran has the State. And he is welcome to it. May he so appreciate the heartiness and completeness of the welcome that he will wish to accept it for the remainder of his life.

It is seventeen years since the last assemblage of the Grand Army on this coast. Should it be another seventeen years before the next coming there will be a vast increase in the roll—up yonder. And the march will be slower.

To those who are here, we say that California has the best on earth to give you. It's none too good for you. Stay and enjoy our fruits, our flowers and our tempered breezes.

We all say—Welcome.

THE CANAL TREATY REJECTED.

With disappointment the news of the rejection of the canal treaty by the Colombian government is received. It means sure delay and possible defeat of the Panama canal. It may mean the possible taking up of the Nicaragua route, which if done without too great delay, will give to Californians and many others their first desire.

Under the law, the President is instructed to accept the Nicaragua route if unable to complete its arrangements with the Colombian people. The unanimous rejection of the treaty by the Colombian Senate would indicate that the rejection is final. We hope negotiations will be opened at once with Nicaragua.

Late dispatches of a private nature state that the Colombian Senate on the evening of the 13th appointed a committee of three senators to come to an agreement with the House of Representatives for the purpose of passing a bill authorizing the government of Colombia to make a treaty in the form approved in advance by both houses of Congress.

Whether this means a new treaty or amendments of such a nature as to prevent its acceptance by this country remains to be seen.

SUCCESSFUL MARKETING.

J. M. S., of Otay, Cal., asks the following: "What is the meaning of the combine between the Association and the commission or f.o.b. men? How are the growers to be benefitted by the union, if present condition of the market is a sample?"

The question asked by J. M. S., we believe to be pertinent and timely. It is one that is uppermost in the minds of a number of growers—of exchange members as well as outsiders.

To answer the question a good many points of view must be taken of the citrus industry.

What was the cause of the formation of the Exchange?

Why the selling delivered plan?

Why did the f.o.b. and commission houses join in forming the Citrus Union and that body merge with the Exchange in forming the California Fruit Agency.

Then the latter part of the question—"how are the growers to be benefitted by the union if present condition of the market is a sample," calls up another list of questions.

What was the cause of the poor demand for citrus fruits this year?

What caused the holding back of the fruit in the early part of the season, causing a glut in the latter part?

What was the cause of the poor keeping quality of the fruit as well as the poor flavor?

The answer to all these questions is known to almost every grower.

The present selling delivered plan of citrus fruits was evolved by the Exchange several years ago, when the f.o.b. and commission sales had been proved failures. This plan had been declared impracticable by the commission houses and outside growers, yet in the formation of the fruit agency the plan of handling the fruit by the Exchange was adopted and the Exchange officers and selling agents continued.

The forming of the Fruit Agency and adoption of its selling plan was a complete acknowledgment of its superiority.

The cause of the low prices received this year was not—and we believe the growers agree with us in saying it—the fault of the agency.

Poor quality, holding back of fruit before the formation of the agency and a consequent glut was not in the marketing end of the transaction.

The Cultivator does not mean for an instant to say that no mistakes have been made by the Exchange. We are not here to apologize or explain away mistakes, nor gloss over any irregularity that may occur. The growers in the Exchange have access to the reports and can tell whether their fruits are being handled to the best advantage. The annual meetings are now being held, the reports read and contracts entered into for the coming season. Attend your annual meeting, get at the inside facts before you register your kick, then if you don't like the way things have been managed make your protest, and make it hard.

But there is one very important proposition the Cultivator wishes to impress on the growers at this time, and that is, the crop for next season promises to be a big one—35,000 cars is the prediction. What are you going to do with it? To successfully market that number of cars will need a magnificent organization, one that can handle the old and exploit new markets.

We are not attempting to extenuate any shortcomings in any direction, but we do wish to impress on the growers that until they can find a better plan of marketing they sould be slow in knocking on a proposition that is managed by men admittedly able and honest and who are working for the best interests of the citrus industry.

THE STATE FAIR.

On Monday, August 31, the State Fair at Sacramento will open. Only a little over a week from this issue of the Cultivator. An honest effort is made to produce a fair which will be true to name—an Agricultural Fair.

How this will be received by the producers of the State remains to be seen. The "fairs of the past few years have been in no way a credit to the State. Worse, they have been largely gatherings of jockeys, pool sellers and gamblers. How much this has prejudiced agriculturists against it we do not know.

We trust the present movement for a for-sure fair will be heartily seconded. But if this support is not as complete as it should be the first year there should not be discouragement. The Pacific Rural Press says:

"If the fair should be allowed to fail after shuch an effort the conclusion would be almost irresistible that the people care little for it and that it had better be forsaken. This would place California in the position of abandoning an annual exposition of its progress which would, in the mind of the country at large, remove California from the list of progressive States, and, with interests depending so largely upon agricultural development, this would be exceedingly unfortunate and injurious."

But we trust such conclusion will not be reached, should this first year under its reorganization prove less successful than hoped.

The California Promotion Committee, also the State Board of Trade and other bodies are joining in making the fair a success. Let the farmer encourage it. The new premium list has many attractive features. Secretary Lowden will mail copies to all requesting them.

A meeting is called for September 8 to be held in Chicago, for the purpose of considering the formation of a mammoth Farmers' Co-operative Association, to include all farmers of the country. Dollar wheat, 60 cent corn and 40 cent oats throughout the year is one of the claims of the prime movers. We hope this is a case of co-operation and not of crankiness.

We note that Highland Park, a beautiful suburb of Los Angeles, has formed an improvement association and is working for more well-kept roadways and roadsides. This particular association is only one of many such associations which are accomplishing results. Public sentiment is a power and these clubs create sentiment.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

AS A SHEET ANCHOR.

Those growers who have sacrificed their time and talents for the last few years in building up the scores of co-operative institutions which give existence and authority to the organizations formed for selling the products of their orchards will never have to fight over the same grounds again. As ways and means of conducting the next campaign of marketing citrus fruits come under discussion this summer, none are found advocating the abandonment of co-operative marketing. This is the first year since the co-operative movement began that no one is found presenting a new scheme to supplant the selling agency devised ten years ago in the wisdom of the co-operators. There are a few free lances who have never entered into the spirit of mutuality that has achieved such stable results for the citrus fruit industry, and whatever of criticism is found against the plan adopted last spring comes from them. The only public discussion heard this season upon the fruit marketing question is before the farmers' institutes, and the advisability of co-operation along the lines established several years ago seems to have been answered finally in the affirmative. Just see what two years have brought about. In the spring of 1901 a deep-laid scheme was hatched, apparently by those who had no interest in the business either as growers or shippers, to destroy the co-operative spirit among the fruit producers. We were treated in big black headlines to "Faulty Methods of Marketing," "Evils of consignment Shipping," "A French Model," "David Lubin With Us," and a dozen others calculated to catch the unwary and weaken the co-operative idea. But the effort was ridiculed by the growers and made light of by the shippers whom it was voluntarily set forth to benefit.

Only two years of inevitable grinding on toward the finish were required to settle it. The questions of selling delivered and selling f.o.b. would not down with one-half of the fruit in the hands of the Exchange and the other under control of the shippers. It did not occur to the average grower then that it could never be settled under these conditions or under any conditions other than the control of the entire output of fruit by one authority. Neither did it appear that distribution of the fruit could ever be properly acomplished till one authority had control of it. Nor did there seem an end to the war between the co-operative growers and the so-called independents. The former had striven for years to secure a greater proportion of the growers, but could not so long as there were other means of their disposing of their fruit. But the climax came last February, and since the promulgation of the union, one wonders how the crash had been staved off so long, with these two great factors in opposition at every market center in the country. The expected may have happened sooner than was contemplated, but none the less inevitably. For the dealers had the same right to continue handling the fruit for one-half the growers that the Exchange had for the other. In this dilemma only three things were possible: The disorganization of the Exchange; the adherence to the Exchange of all the outside growers, or consolidation into one selling agency. The latter was what occurred, and unless the critics can controvert the fact as set forth in this sentence no other solution has ever been possible. Thus we see the futility of the criticism—sporadic and harmless to all—indulged in by those growers who would not unite with the Exchange and have no better place to offer than that now in successful operation. Those who carp about consolidation should remember that they themselves were prime factors years ago in shaping the ends just reached and from which conclusion of the question there was no escape. It comes

with ill grace, then, for these former outsiders to try to undo their own doing, inadvertently as they may have been forming conditions that could culminate in no other way than in the consolidation of the two great forces that faced each other for years with so much loss to the entire industry But few will hold back now that events, clearly the outcome of the growers' own acts, have compelled amalgamation to avoid destruction. All thoughtful, conservative growers will accept the new plan, and only those who think the genius of selling fruit rests with the individual wll fail to give all posible assistance to the work of the California Fruit Agency.

A Cultivator representative strayed into the F. rmer's club meeting last week held at the home of A. D. Bishop near Santa Ana. Mr. Bishop is president of the club. Roy Bishop gave an interesting talk upon manuring, nitrofying, and de-nitrofying bacteria; he also exhibited, under microscope, the white, red, and black scale, and the little insects that destroy the scale. Music and refreshments came in the last part of the evening and every one had a good time. The ladies and future farmers and farmer's wives were present and enjoyed themselves. One suggestion made by Dr. Wall was that one could make the best budding cloth by using strips of cloth dipped in hot beeswax and wrung out. He claims tnat resin spoils budding.

GENERAL NOTES.

The apple crop of New York State is said to be about one-half of the average crop.

There will be an irrigation demonstration prepared by the government for exhibit at the St. Louis Exposition.

The Battleship Massachusetts suffered from a collision witn a submerged rock while near Bar Harbor, Maine.

Apples are dropping very badly in nearly all Eastern apple sections, and there is a probability for a very light crop.

Turkey is having new trouble from another outbreak in Macedonia. Russia is intending to take a strong hand in the matter.

W. H. Mills has been appointed chief of the department of forestry for the California exhibit at the St. Louis Exposition.

The officers of the National Irrigation Congress have made an offer of a loving cup, valued at $500 for the best and largest exhibit oi green fruits at the National Irrigation Congress.

Professor Elwood Mead, in charge of the irrigation investigations for the U. S. Department of Agriculture, has left this country for a trip in southern Europe. While there he will investigate irrigation institutions.

A matter for general congratulation is the broad national attitude which the Eastern press has assumed in treating the irrigation problem since the subject was brought prominently before the country by its discussion in Congress, followed by the passage of the National Irrigation Act.

The American Forestry Association will hold its annual meeting at Minneapolis, Minn., beginning next Tuesday, and hold three days. The program includes several papers on "Taxation and Private Forestry," "Government Aid to Private Forestry;" "Forest Culture in Agricultural Colleges;" "Trees, Plants," and many other matters which mean much to the future preservation of our water sheds and lumber supply.

The Bureau of Forestry is now maintaining a force on the mountains about Pasadena, surveying, and planning for the establishment of a forest tree nursery. Their investigations are looking toward the best varieties for certain conditions, how best to plant, propagate, protect from forest fires, etc. L. C. Miller, who is in charge of the party, says the work will be completed by November. There are immense posibilities of protecting our water supply in these mountain ranges.

Coast News and Notes

By R. A. Dague, 1045 Regent St., Alameda

Over an inch of rain fell in the Yucapai Valley last week.

Wastonville shipped three cars of prunes to Germany last week.

The net returns of the melon output of Coachella is over $40,000.

San Bernardino reports the honey crop will be one-third of the average.

Ocean Park is taking steps to incorporate as a city of the sixth class.

Ventura County Board of Supervisors have passed a rigid anti-saloon law.

The Julian apple section promises the biggest and finest apple crop in years.

The crop of beans in Ventura County this year is estimatea at 500,000 sacks.

Jeffries remains the boss slugger. Hog cholera is still raging in Kings County.

About forty tons of Sardines are handled every week in the cannery at San Pedro.

Early predictions are being verified as to an immense apple crop at Watsonville.

The hop louse is still abundant in Somona county, notwithstanding this, a fair crop will be harvested.

The "man hunt" for the escapes from the State prison, not proving profitable, has been abandoned.

Santa Cruz is establishing a tent city, which had been made so popular in Coronado and Catalina Island.

The Santa Rosa Poultry Association is now selling its eggs in San Francisco direct, instead of by the former auction plan.

The Walnut Asociation of Oxnard is overhauling and repairing its warehouse. The output of this year will be far below the average.

Los Angeles County School Board has ordered the discontinuance of the vertical style of hand writting. Doubtless many other Boards will follow this example.

Claremont, the seat of Pomona College has just completed a large number of mains which now gives it one of the best domestic water systems in California.

There are now thirty-four rangers doing guard duty in the San Gabriel and San Bernardino forest reserves. These reserves comprise over a million and a quarter of acres.

Monterey County has refused to make the $250 appropriation for experiments to kill the codling moth in packing houses. Santa Cruz is working along that line however.

The Banning Company, owners of the famous Catalina Island propose to erect a magnificent new hotel at the isthmus. This will make the isthmus a strong rival of Avalon.

The raisin growers of Fresno are still hoping to have this year's contract signed up by sufficient producers to make it effective. The hope, however, is not so strong as it was early in the season.

The Co-Operative Telephone Company of Pomona, which was first organized in a farmer's club meeting, is now ready for operation, and is said to be one of the finest installed plants in California.

The black leg disease has invaded Nevada City section, and hundreds of head of cattle are dying as a result. Vaccination of the stock not yet diseased is being carried on as rapidly as possible, in the hope of saving some of the stock.

The Santa Clara valley section is discussing the prices of prunes for the coming year. Packers wish a two and one-half and two and three-fourths cent basis, while the growers are yet holding for three and one-fourth to three and one-half cents. It is probable a 3 cent compromise will be made.

There is an epidemic of typhoid fever in and near McCloud, Siskiyou county. Several deaths have occurred.

It is estimated that the celery crop of Orange county this year will be 2200 acres as compared to 1800 acres last year.

Santa Rosa is advertising for bids for the installation of a pump that will have a capacity of 2,500,000 gallons a day.

One of the Stockton canneries employes 400 hands. At this writing a half million cans of apricots have been put up.

Mr. Harry, State Grange Organizer, is hard at work in the Santa Clara valley organizing farmers into co-operative associations.

The apricot crop in the vicinity of Haywards proved to be the most profitable for many years. The prices ranged from $27.50 to $30.00 per ton.

Mr. Griffith, live stock inspector of Kings county reports that stock in his county is in a very healthy condition with the exception of swine. The cholera is still very serious.

George E. Colby, chemist, in the Agricultural Department of the University has just issued a bulletin on "Arsenical Insecticides." It contains a thorough treatise on Paris green, its use and abuse, also formulas.

There is now on exhibition in the rooms of the Oakland Board of Trade, left there by W. S. Fake, a sample of "Vegetable Marrow." The vegetable is shaped like a water melon and it grows on a vine like a squash.

Fresh fruit shipments from California are still keeping up. The Southern Pacific alone sends eastward one hundred car loads each day. The officials calculate that during the season they will ship a total of 8000 car loads.

Twelve thousand acres of land has been reserved by the U. S. Government on which to experiment in irrigation work. The land is located in the bend of the Colorado river north of the Yuma reservation in San Diego county.

The Hunt Cannery near Haywards is next to the largest fruit cannery in the world. During the busy season 1100 employes are kept at work. The average output is 3600 cases per day with two dozen quart cans to the case.

The blackleg disease is very bad among the cattle in the vicinity of Chicago Park. The hills are dotted with dead animals. A large number of men are kept busy cremating the dead bodies while others are vaccinating the healthy cattle.

Large quantities of redwood lumber is being shipped to Europe from Eureka. Last Saturday the "Grasmere" carried 869,049 feet of rough, clear redwood lumber, valued at over $25,000. This cargo makes a total of 3,311,343 feet, valued at $86,073.49.

The Davisville Almond Growers' Association has sold the entire almond crop of its members .. the following prices: Nonpariel, 10¾ cents; I. X. L., 10⅛ cents; Peerless, 9; Routier, 8; Drake, 8 8-10; Ne Plus Ultra, 9⅞; Texas Prolific, 8¼; Languedoc, 8¾; Golden State, 8¼.

Three years ago A. Hagirman, of Livermore, planted the Moravian barley as an experiment. The first year's yield was 350 pounds from a five pound sample; the second, 8000 pounds from 350 pounds of seed. The barley this year reaches the standard weight of fifty-four pounds to the bushel.

A count taken by Prof. Clarke this week of the wormy fruit on a properly sprayed Gravenstein apple tree and that of an adjoining tree which had not been sprayed showed the former to have but 3-10 of one per cent. of wormy apples while the latter showed a 14 per cent. loss.—Watsonville Pajaronian.

NATIONAL BEEKEEPERS.

The National Beekeepers' Association have held their thirty-fourth annual convention in the city of Los Angeles this week. There was an informal gathering largely of California beekeepers, discussing California marketing problems and other local questions on Tuesday. This was in charge of the California National Honey Producers' Asociation which handles most of the output of this State. This is purely a co-operative organization of the producers.

The subject of cans or barrels as a means of packing was discussed, and sentiment was divided. It is said by those who have experimented that the barrel would affect a saving of about half in the present cost of packing.

On Tuesday evening the formal welcome and reception was tendered to the National Association. The orchestra of the First Methodist Sunday school furnished the music, much to the pleasure of six or seven hundred people gathered there. The meeting was calld to order by T. O. Anderson. of the State Association, and welcome was extended to California by Prof. A. J. Cook. Pres. W. Z. Hutchinson of the National Association made a brief response, as did J. W. York, secretary of the National Association. Other short talks were made by A. I. Root, Dr. Miller and Mr. France. Wednesday morning the business of the session opened in earnest with Pres. Hutchinson in the chair. The election of officers resulted in J. V. Harris, of Grand Junction, Colo., being elected president; Chas. Dedant, of Hamilton, Ill., vice-president; Geo. W. Brodbeck, of Los Angeles, secretary.

One of the features of Wednesday were the talks on co-operation. It was led by Prof. Cook, who showed the great advantage of proceeding on the same or similar lines to the Southern California Fruit Exchange, and to further strengthen his position, called on J. A. Reid of the Semi-Tropic Fruit Exchange, to give the work of that system of marketing productions. J. F. McIntyre, of Sespe spoke on "How to Make a Production of the Extract of Honey. A. I. Root of Medina, Ohio, J. S. Harbison of San Diego, N. E. France of Wisconsin, Homer H. Hyde of Texas, and other noted bee people spoke.

The attendance was most gratifying, there being over 200 delegates and representatives of every State in the Union. The annual production of the Beekeeper's represented amounts to over $25,000,000.

The Campbell Visitor says: "It is really amazing the magnitude of the fruit business of this county, and to think it is but one of the many fruit counties in California. Just take the packing houses along the railroads from Los Gatos to San Jose—a distance of ten miles or less. Los Gatos has the Hooke Cannery Company and the Curtiss Packing Company. Campbell has in súccession the Campbell Fruit Growers' Union (the largest fruit drying plant in the world), the Central Santa Clara Packing Company, the J. C. Ainsley Packing Company (which send over 1,000,000 cans of fruit to England yearly), the Royal Packing Company just north of town, and scattered along the track toward San Jose are the following very extensive fruit concerns: George F. Frank, George N. Herbert, Santa Clara County Fruit Exchange, California Canneries Company, the Ernst Luehning Company, and the Griffin & Skelley Company. The output of all the large concerns is beyond belief to one unacquainted with the magnitude of the fruit business as carried on in Santa Clara county. Then around the railroad track in San Jose fruit warehouses string out in great length. From present appearances it won't be very long before the entire track between here and San Jose will be lined with warehouses of various kinds.

Every farmer boy wants to be a school teacher, every school teacher hopes to be an editor, every editor would like to be a banker, every banker would like to be a magnate, and every trust magnate hopes some day to own a farm and have chickens and cows and pigs and horses to look after. We end where we began.—Saline County (Kan.) Index.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

Continued.

We now have the great phylum or branch arthropoda well before us. We note that they have jointed bodies with jointed feet, which is true of no other animals. We note that the insects breathe air and so differ from crustacea. They have six legs always when mature, and so are unlike myriapods with their numerous legs and different from spiders which, if we except mites, always have eight legs, and though the mites have six legs when they first hatch, they always, after the first molt, have the eight legs.

All the air breathing arthropods except spiders have antennae, while insects alone of these classes have in maturity compound eyes. They often have the simple eyes, while myriapods and arachnids have no other. The insects or Hexapoda are well separated by having a distinct head, thorax and abdomen, and are peculiar in passing through quite marked transformations. We have seen, however, that some go through much more complete metamorphoses than do others. When mature, insects are generally characterized by wings, and we have seen that some have mouth organs fitted for biting. We say that these have typical mouth organs, and are mandibulate. Others have these organs modified to fit them for sucking and so are called haustellate.

* * *

Lace-Wings or Neuroptera—These are most familiar to us in the dragon flies, or darning needles, or devil's darning needles as they are variously called. All have noticed their graceful flight, as they curve about the ponds or reservoirs, or swoop down on their insect prey. The lace-wings are well named, as all four wings are netted veined. That is, they not only have the long veins that stretch from base to tip of wings, but very numerous cross-veins, so that each wing, and there are always four, looks not unlike lace or a net. Usually the front or primary wings are largest, but in many lace-wings, and in these dragon flies, the reverse is true; the lined wings are the larger. The scientific name which the great naturalist, Linnaeus, gave to this order, Neuroptera, is also very happy, as it means nerve-wings, referring to the numerous nerves, or the ample neuration. As in all orders, so here, there are many that have no wings. This is true of the workers and soldiers among white ants, though the queens and males have the netted veined wings. We must remember that the white ants are very different from the common or true ants, which latter belong to the same order as do the bees and wasps.

These lace-wings also have typical mouth organs, and so are mandibulate. We note the large upper lip or labrum, under lip or labium, which in the larvae and pupae of dragon flies is very long and curiously modified. It looks not unlike a long-handled dipper, and the handle is possessed of a hinge, so the bowl part of this curious animal dipper can double over and cover and hide the strong jaws. When our picnic was held last spring at the Curtis or Edgemont ranch one of the Curtis lads showed me this curious arrangement, which he had discovered, and wished me to explain it, which I was glad to do. The two pairs of jaws, mandibles and maxillae, which, as we remember, move sidewise, are very large and strong, so that these young dragon flies are well armed for their savage work, as they are powerful marauders in the pools and ponds and capture and devour many a smaller and often a larger inhabitant of the self-same pool.

All lace-wings or neuroptera have the typical mouth organs which fit them well to capture and devour their insect prey, for as we shall see all the insects of this order, if we except the one family of white ants are insectivorous, that is, all feed on other insects and so we may say all are our friends. The dragon flies, however, carry this a little too far, as they often catch and feed on the honey bees. This is specially true in the Southern States, where no little harm is done. Yet even these dragon flies do more good than evil, and that too in regions where the evil is most conspicuous.

In transformations, some of the lace-wings are complete, as we note in the ant-lions and aphis lions, while in others the metamorphoses are incomplete, as we notice in the dragon flies. The former we know as neuroptera proper, the latter as pseudo neuroptera, or false neuroptera. Thus we have these two sub-orders of the great order of lace wings or neuroptera. The larvae and pupae are very different from the imago in the first, and the pupae are inactive. While in the second, as seen in the dragon-fly family the larvae, pupae, and imago are much alike, and the pupae are always active, with habits like those of the larvae and imago.

Since I gave the talks here at Long Beach on insects I have heard of more than one boy and girl who are taking an earnest hold on the study of insects. I hope others are commencing, and that many will be led by these articles to the same pleasurable study.

* * * *

GOOD CULTURE.

Mrs. S., Long Beach, asked me to visit her lemon orchard, and advise her as to the needs to make it more vigorous and profitable. I found it well marked with variegated leaf and dieback. It is somewhat foul with scale but not enough to explain its unthrift. The cause of its decline was not far to seek.

It is crying loud for good, thorough deep culture. The land is rich clay loam, yet it is hard and intractable. There is no chance for the air to penetrate, and so bacterial action, or the necessary nitrification is almost wholly absent in the soil. Again the capillary tubules are all intact, and the loss of water through evaporation is enormous. The adoption of good thorough tillage with a generous application of stable manure to furnish humus and loosen up the soil would pay a tremendous per cent on the outlay. Mrs. S. asked me if I would spray, and if so when. I answered that it were well to kill the black scale, and that a single spraying about the 25th of August would kill nearly if not all, if it is thoroughly done, as the eggs were nearly all hatched and as yet all were so immature that all would be killed. Yet I would hesitate to spray an orchard in such unthrift, as it would surely drop many leaves. The first thing is to mellow up the soil and give a good deep irrigation; then as the trees brighten up, give a good spraying with a 2½ or 3 per cent distillate spray.

* * * *

THRIFTY CONDITION FOR SPRAYING.

I visited several of the orchards about the sightly Signal Hill, south east of Long Beach. That it is a splendid citrus region is apparent to the trained eye, and is also shown by such splendid orchards as that of Mr. Sommers. Here good culture and excellent thrift are companions. Some others look sickly. Such orchards will give no profit and are an eye-sore to the passer-by, and a blot on the landscape. I saw one orchard in this ill condition that was being sprayed. Spraying such orchards will give ill repute to spraying as they will drop their leaves. No orchard should be either sprayed or fumigated, except when in first-class thrift, and no orchardist can ever afford to have his orchard in any other condition.

* * * *

SECURING BULLETINS.

Yale I. Thorp, Norwalk, asks how he may procure Bulletins. I am glad to answer, and urge all to secure these valuable helps. For State Bulletins write Dr. E. W. Hilgard, Department Agriculture, Berkeley, California; for United States Bulletins address Department of Agriculture, Washington, D. C. The Bulletins of Florida are of great value in our state. One just issued on White Fly, aleyrodes citri, should be carefully read by every orange grower in California.

* * * *

BEE MOTH.

S. A. Hinkle, Pacific Beach, asks how to keep bee-moth caterpillars from disturbing the bees and how to rid a colony of them. Good strong colonies will rarely be injured. Thus a good bee-keeper will have little concern. In looking over a colony, if a caterpillar is seen it should be dug out. If a colony is badly infested (it will usually be a weak queenless colony) the bees should be shaken off and the comb sulphured to kill all the caterpillars. The sovereign cure is: "Keep all colonies strong."

* * * *

HORTICULTURAL COMMISSION.

It was my privilege to attend the monthly meeting of the Horticultural Commissioners and Inspectors last Saturday. The report on the South African chalcid—Scutelista cyanea—was very encouraging. Mr. Wood's discovery that the Rhizobii were exterminating the Pulvinaria scale in the apple orchard about Downey, where it is a serious pest, was very interesting. Surely these monthly conferences are very valuable.

COMBINATION OF ORCHARD AND DAIRY.

Continued from first page)

again sorted into three grades, fancy, choice, and standard; or Mr. Leffingwell's brand is "Triple L," Triple X," "Triple E," respectively. There is no grading as to sizes until it reaches the bins of the packers, that is, except the invariable grading which is done in the orchard as the fruit is picked.

One handicap of Mr. Leffingwell's economical handling of lemons has been the haul of four and a half miles to the railroad, but now with the electric line running its grade stakes across the corner of the ranch, he hopes he may be able soon to have a siding running direct to the packing house, and to switch the refrigerator car over the electric line from the main overland railroad. As it is now, four four-horse loads are required to transport to the railroad packed fruit for each car. It is all done, however, on wagons provided with springs, so that the fruit reaches the cars all in good condition.

The system of pruning is illustrated by the photo of one of the 7-year-old trees. E. A. Williams has charge of the pruning under Mr. Leffingwell's direction. The system is a modification of the Baromo method. That is instead of having four main leaders with one general head he prunes out from the four leaders then encourages from the center another system of leaders, thus giving "decks" which may amount to four or more as the tree gets older. The general form of the tree is shown in the cut on first page.

From the lemons we turn to the dairying feature of the ranch. This was started by Mr. Leffingwell more as a fad than with the idea of profit. But it has proved one of the best paying features of the ranch. On the dairy page of this issue will be found a cut of Winksetta, which is the pride of the ranch, and on first page appears Sergeant Fox, the head of the herd. There is also Vela Hastings, whose report as a dairy cow is a most enviable one. Another heifer from Brown Bessie's Marigold is supposed to have a future, which will make a reputation outside of this ranch. The cream is separated on the ranch, and in fact the products of the dairy are consumed on the ranch. Notwithstanding this, care in the dairy is equal to that where the product goes to market.

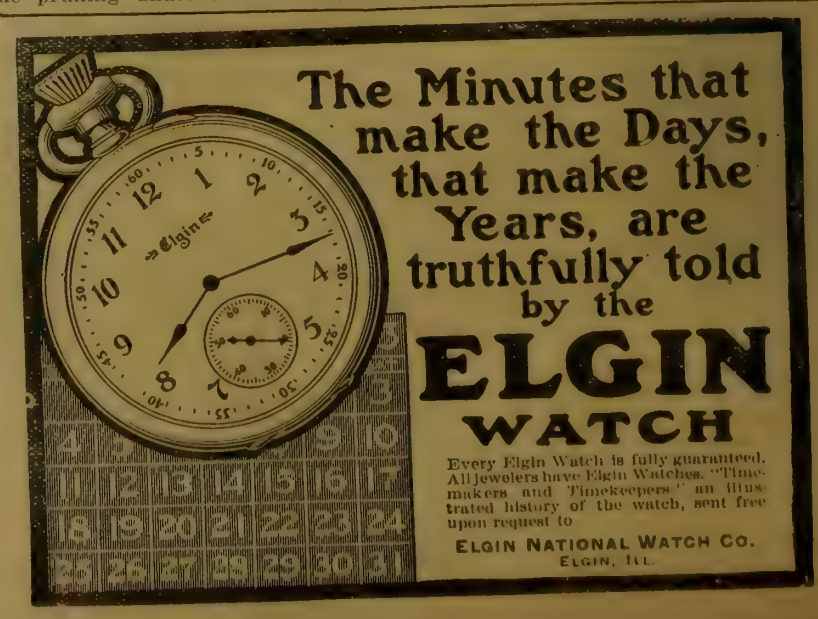
The cost of lifting the water is so great that Mr. Leffingwell has never raised alfalfa on his place, but grows most of his own feed in the form of corn. Sometimes he uses it as silage, but at present it is being used as fodder. Another feed is in mangles and other root crops. Of course to supply nitrogen a limited feed of bran is given each day, and occasionally alfalfa is bought.

The manure is hauled direct from the stables without composting to the fields and spread. Mr. Leffingwell considers that there is no loss as there may be in composting, and there is economy in handling at once and placing where it does the most good. To further utilize the waste of the dairy, a large herd, nearly seventy, of Berkshire hogs are kept, and at the head of the herd of one of Session's prize winners. These various departments of the ranch are each under the charge of a manager, and Mr. Leffingwell keeps an oversight of even the details of the business. In addition to Mr. Gray, the foreman, and the others mentioned, Mr. Fairchild, is bookkeeper and secretary to Mr. Leffingwell, and aids in keeping the accounts of the ranch.

A large number of viticulturists of the Calistoga district held a mass meeting on the 12th inst., at which they passed the following resolution:

"We, the viticulturists of Calistoga and vicinity, in mass meeting assembled at the Hotel Calistoga, August 12th, for the purpose of discussing the new and mysterious disease claimed to exist in our vicinity by Professor E. H. Twight of the Agricultural Department of our State, do hereby resolve that we know of no new and mysterious disease in this county.

A secret meeting of the wheat buyers of the North Pacific Coast was held at Tacoma tne 12th inst. They agreed to advance the price of flour 20 cents per barrel. They claim that while there is a shortage in the wheat crop yet wheat is in this country two cents per bushel above what the foreign market will stand.



California Horticulturally...

John Isaac, Sacramento

PRUNE CONDITIONS IN SANTA CLARA.

Prune conditions through the Santa Clara valey continue to improve as the season advances, and while there will not be a full crop of prunes through this section, the crop is turning out very much better than was looked for in the beginning of the season. It was then stated that the output would fall to one-half or one-fourth of a full crop. We now learn from parties who have covered the field and who are competent to judge, that there will be a fairly good crop in the valley as a whole, and that the fruit is running very much to large sizes. In a few small locations trees are bearing very slightly, and it is this that will bring down the average. The question of a profitable market is still a serious matter, but with a short crop reported from the prune sections of Europe, there will probably be a demand for California stock there, which will stiffen the local market. The prune growers are alive to the fact that in order to get any sort of a price for their products they must work together and efforts are making to bring them together in some sort of acceptable organization.

* * *

ENEMIES OF SAN JOSE SCALE.

Entomologist Marlatt, of the Department of Agriculture, at Washington, has introduced from China a lady-bird enemy of the San Jose scale from which great results are expected. This is the Chilicorus similis. The same insect was introduced into this state some ten or twelve years ago by Prof. Koebele, during one of his expeditions in search for beneficial insects for the State Board of Horticulture. It was established in several parts of the state, but afterwards no track was kept of it, as a much more efficient enemy of the San Jose scale was found in the Aphelinus fuscipennis, a very small internal parasite which working inside of the scale destroyed the eggs of the pest and soon reduced it below the danger line. The San Jose scale is no longer a pest in California, and even in the section from which it derives its popular name it is almost impossible to find examples of it. The little internal enemy started its work some twenty years ago, and it was a long time before it overtook the scale, but gradually the scale began to disappear and few people knew why. Some who ascribe everything to our climate, said that was the cause, that we had so good a climate that no bad thing could exist in it, while all good things thrive. But for all that, the San Jose scale got a foothold here and spread in the same climate in which it afterward disappeared. It may be that the Aphelinus will not do so well in the east as in California, and that the lady-bird may prove an efficient check on the pest there. With our long seasons the Aphelinus has from one to three more broods in a season than it does in the east and this is a great advantage to it in its work. The little fellow, however, has done some good work in the east and in a report made by Prof. W. G. Johnson, now editor of the American Agriculturist, before the Association of Economic Entomologists, some few years ago, he spoke very highly of the work of this parasite and entertained hopes that it would accomplish in the east what it had done in California.

* * * *

SOME HINTS FOR YOUNG FRUIT GROWERS.

The young orchardist, who has a new orchard to lay out, has many advantages over the older men in the business, in that it will not be necessary for him to carry on any costly experiments. He has before him the examples of the successful fruit grower and is enabled to avoid all the mistakes that have strewn the way to success with wrecks and losses. He knows just what varieties to put out for profit, just what kinds will do best in his particular locality. Planting, pruning, and cultivating are now reduced to a science and we know just how to do it. But in making these discoveries there have been endless experiments and countless failures. The new man is sure of his footing. His neighbors have shown him the way and he has the opportunity to establish an orchard and that his neighbors can never hope to approach. And it will well repay any one who is thinking of embarking in the orchard business to study the conditions of the neighborhood where he intends to locate and to visit some of those who have fought their way to success in that section and get some practical hints from them. And so liberal are our fruit growers as a rule, that they willingly give away knowledge that it has cost them hundreds of dollars in time and losses to acquire. There are yet ample opportunities for success in fruit raising and while there may sometimes be seasons of depression, the fruit acreage will continue to increase and a paying market be found for the product. But it is imperative that the man new to the business avail himself of the experience which has already been acquired and he will then avoid fatal mistakes. He should first decide as to what section he intends to locate in, then what varieties do best there. If it is in the early section, he wants to grow early fruit for the market, if in the interior valleys then he must grow canning or drying varieties. In some sections grapes do best, in others prunes, and so on and he will do well to conform largely to the varieties which experience has demonstrated are best for that special locality. There are at the present time many people investigating the fruit industry in the northern counties and a few hints of this kind may be of service to them.

WHITEWASH.

A good whitewash for chicken house, barn or fence is made as follows. It's old and has been given before but will bear repetitnon:

A good whitewash can be made by slacking ½ bushel of lime in warm water and enough cold water to make it thin enough to spread well. Add to the mixture ½ peck of salt, and stir until dissolved. Strain through fine sieve. This can be put on with a brush or more quickly with a spray pump if the surface is rough.

Some people head off a fit of misery by finding fault with other people.

If you get the worst of it make the best of it.

INSURANCE AT COST

We are furnishing Insurance to the farmers of Los Angeles county that is

Safe, Sound and Conservative

Over 2,000 farm buildings in this county are covered by policies in our company, at a cost, during the past four years of only 5 cents per hundred dollars per year. Why pay big salaaies and dividends to eastern officers and stockholders? Before your present policy expires drop us a postal card and we will send you full information of the mutual plan.

LOS ANGELES COUNTY FARMERS MUTUAL FIRE ASS'N

Chartered by the State

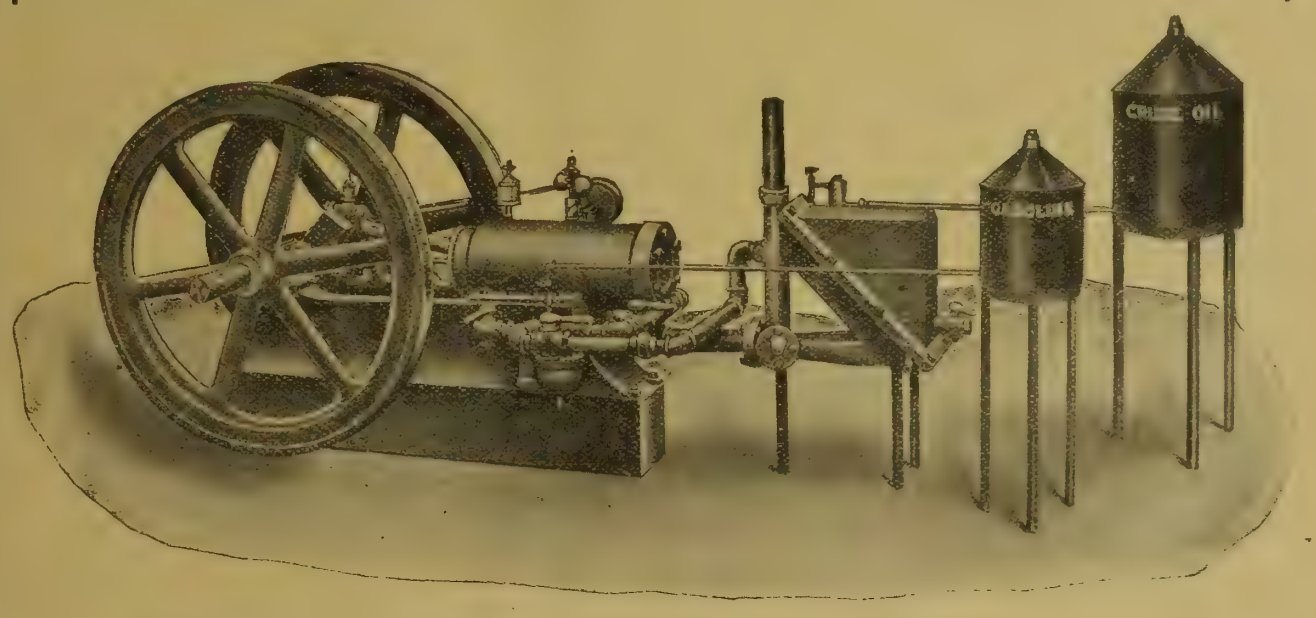
G. F. CROMER, Secy.

207 Currier Bldg. Los Angeles, Cal.

Most of us are in sympathy with that man who said the problem of his life was how to make both ends meat.

Samson Crude Oil Engines

Are the most reliable and simple engines for all purposes. With our crude oil generator attached, as shown in cut, it is the cheapest power on earth.



We are continually attaching our generators to other makes of engines, even to those which already have crude oil generators, because ours is simpler and requires no attention after the engine is started.
We also manufacture centrifugal pumps of the highest efficiency, for which the SAMSON has a high reputation.

Complete Irrigating Plants

ARE OUR SPECIALTY

We can furnish you just what you need, and can tell you your requirements, as our experience is very large. When you buy the Samson Engine and Pump you get the best, and it costs you no more than would other makes that are often times unreliable. Every part on our engines and pumps has been thoroughly tested and no parts of them have ever broken.

We are continually making extra parts for Eastern-made engines, as we can prove to you if you will call at our works. These parts are expensive to the owners of such engines, and should be taken into consideration before buying.

We have this harvest season placed (4) of our Samson special made harvester engines on combined harvesters owned by J. Brack, Jr., Lodi; W. Journeay, New Hope; Warren Fowler, Lodi; A. A. Sturgeon, French Camp. These engines have made a record for us and have proven what the Samson is. Fifty acres are being threshed daily with each of these rigs and the expense of operation is not as much as with horse power.

We are soliciting orders for these engines for next season. Give us a call when in Stockton, or drop us a card and we will call and see you.

Samson Iron Works Stockton, Cal.

By J. W. Mills, Ontario, Cal.

NORMAND'S YELLOW PLUM.

Editor Cultivator—Under separate cover, I send you a plum over which there is some dispute as to name. I wish you to identify it. It is an excellent plum and I wish to know positively before planting out any trees. Should I wish to work peach trees over to plums or peaches, which is the better way, to graft, or bud?

E. H. Fosdick, Los Angeles.

The plum you send is Normand's yellow, and as you say, is a good plum. It is a Japanese plum that will bear itself to death if allowed to. The quality is always good if given sufficient water, but will become mealy if allowed to suffer for water.

We very much favor cutting off the tops of either peach or plum trees and budding the sprouts when it is desired to change them to some other variety. This is especially true in the case of branches over one inch in diameter. If a graft will not heal or grow over the top of the stump within six or eight months from the time it is inserted, the heart of the stump is sure to decay. That weakens the tree and makes it short lived. Grafts which finally grow over a dead stump do not remain vigorous.

* * *

BLIGHTED LOGAN BERRIES.

Editor Cultivator: Some time ago I saw an inquiry in the Cultivator regarding blighted Logan berries. I lost about one-third of a crop this year from a blight and should like to know some remedy. The vines are on gravelly ground but have been fertilized some and are in fairly thrifty condition.

The berries began to blight when the crop was about half ripe and the thriftier vines seemed to blight as bad or worse than those on the lightest soil. I enclose a sample, and while they are from the second crop, they seem to be affected the same as the former. Walter W. Coke, Pasadena.

The berries arrived in fairly good condition, but the disease that caused them to blight in all probability does not affect the fruit directly. Nearly, if not all of the blights, except sunscald, result from interference with the flow of sap. The blights that are so destructive in berry patches of the East, come from a growth of bacterial disease within the plant. Raspberry anthracnose affects that berry just as you describe the trouble that you have with your Logan berries. If you will send us some of the canes on which the berries were blighted, we may be able to give you some information on the subject. Send the specimens by mail to the Southern California Agricultural Experiment Station at Ontario, and we will give you definite information on the subject.

* * *

THE BEST STRAWBERRIES.

Editor Cultivator: Will you please inform me which are the best strawberries for color and flavor, also which are self-fertilizing and which need others set with them and which will be best to set. Oliver Thornton, Norwalk.

The list of strawberries is too long to name and tell which are self-fertilizing and which are not. Brandywine has proved to be the best market berry for the Los Angeles trade. Lady Thompson is also an excellent berry. Laxton's Noble is also taking well with commercial growers and no doubt will do well in your section. If you plant these three varieties, they (the flowers) will all be fertilized. They are, after several years trial, still being grown in the berry growing districts around Los Angeles. They are all prolific, handsome in color and are as good in flavor as any berries that we know of for commercial purposes.

For the home garden, any of the above are good. The dollar berry is a good family sort. It blooms and bears by itself during almost the entire year. The color and flavor are both good. Of course strawberries can be made very poor in flavor by injudicious irrigation. They are never so sweet immediately after an irrigation

"S. N. Caceres of National City, and T. J. Swayne of Colorado, have each planted a small grove of mulberry trees, and they are going to experiment with silk worms. If their experiments prove successful they intend to go into the business on a large scale. Can the Cultivator give any facts on silk worm culture in California?"

The Cultivator has no regular writer making a study of Sericulture, but if the business develops as there is some promise it may, there will be a future for this industry that the Cultivator will be compelled to give it special attention. We would refer the gentleman who asks these questions and any others interested to Bulletin 165, "Culture of the Silk Worm," issued by the National Department of Agriculture. This is a pamphlet of 32 pages, and will give more information than the Cultivator possibly could. Address Secretary of Agriculture, Washington, D. C.

RED ANTS.

Mrs. Swenson of Lakeside, San Diego County, asks what is the best method of getting rid of red ants both large and small?

Buhach scattered about the cupboard or in runways of the ants is usually effective. Saturated solution of bichloride of mercury painted about the cracks and borders of room and in runways is also good. Another is, dissolve two pounds of alum in three quarts hot water and apply while hot with brush as above or wherever the vermin harbor.

SPLIT PEACH PIT INVESTIGATION

The State Experiment Station is engaged in investigating the occurrence and possible causes of the splitting of peach pits in California. Definite information regarding the occurrence of the trouble is needed in order to determine, if possible, the exact conditions which bring it about. Whether it is due to some organism, fungus or bacteria or whether it is due simply to adverse climatic or soil conditions, has not yet been determined. It is therefore hoped that this circular will reach all peach growers in the State so far as practicable, and it is urgently desired that they will give all information in their possession, by filling out as fully as possible, the blanks which will be sent upon application.

The above is from a circular sent by the State University and on it are questions with blanks for answering.

From the questions we quote: Location of orchard, age of trees, varieties which have split pits, varieties free from split pits. Soil: whether plowed and when, how cultivated and when, Irrigation: when and how applied and quantity of water given. Have you observed that the production of split pits following irrigation, or have you noticed that the time of applying the water has any effect. Unfavorable climatic influences during the present season: Frost or rains during bloom, late frosts, drouth, cold or hot, dry winds, etc., also seasonable rainfall, percentages of split pits in varieties grown in 1903. Are there any individual trees or any variety in your neighborhood, which produce fruit free from splits, how long has your orchard been producing split pits.

This investigation is in charge of Prof. A. V. Stubenrauch, who desires to get in touch with all peach growers.

HOW TO BE POPULAR.

Don't contradict people, even if you're sure you are right.

Don't be inquisitive about the affairs of even your most intimate friend.

Don't underrate anything because you don't possess it.

Don't believe that everybody else in the world is happier than you.

Don't conclude that you have never had any opportunities in life.

Don't repeat gossip even if it does interest a crowd.

Don't go untidy on the plea that everybody knows you.

Don't be rude to your inferiors in social position.

Don't overdress or underdress.

Don't jeer at anybody's religious belief.

CLIMATE AND CROP REPORT

Condensed from the weekly Bulletin issued by California Section of the Climate and Crop Service, in charge of Alexander McAdie.

Sacramento Valley—The weather during last week was comparatively cool, but favorable for fruit and all farming operations. Grain harvest is completed except in a few places, and thrashing is progressing rapidly. Hop picking has commenced in some sections and will be general during the present week. The cool weather has been beneficial to deciduous fruits, which have developed slowly and are of good size and flavor. Grapes are ripening rapidly and harvest is progressing in some sections. Early grapes are being shipped in carload lots from Sacramento. Citrus fruits are in good condition.

Coast and bay sections—Cool weather continued during the week, but a higher temperature prevalied at the close. Fogs in the coast districts beneficial to hops, corn and potatoes. Hops have made wonderful improvement recently and the crop will exceed early estimates. The cool weather has retarded the ripening of grapes. Picking and shipping are in progress. The peach crop in Sonoma county is very large; it is reported that many tons of the orange clings will go to waste, as the canneries refuse to handle them.

San Joaquin Valley.—The weather during the past week has been clear and warm during the day, and cool at night. The fruit crop is ripening fast. The deciduous fruit crop is of excellent quality, but in some sections lighter than last year. Watermelons are being shipped in large quantities from the Fresno district. Potatoes and onions are a good crop. Egyptian corn will be a large crop. Stock of all kinds are healthy and in good condition. Irrigating water is scarce.

Southern California.—Warm, sunny weather prevailed during the week in the interior, but along the coast it was cooler and foggy. Heavy crops of wheat, oats, barley and hay are reported in nearly all districts. Sugar beet harvest is progressing rapidly. In the vicinity of Anaheim the crop is somewhat lighter. Beans, corn and vegetables are doing well. Peaches are maturing, and other deciduous fruits are in good condition. Walnuts are dropping, owing to blight. Citrus fruits are thrifty, and young oranges are showing satisfactory growth.

Eureka Summary.—Grain threshing and hay baling are progressing. August unusualy cool and cloudy along the coast where grain ripened slowly, but very rapidly in the interior. Vegetables yielding average crop.

The California Portland Cement Company is now enlarging its plant and will soon be able to turn out from 600 to 1000 barrels of cement per day. The present output is about 450 barrels. The improvements now being made will increase the capacity to the full 600 barrels, this with other improvements will enable this company to keep pace with the vast demands of this product. Competent engineers have declared this cement to be one of the strongest and the best cement for foundation work, there is made. Lately the demand has been so great that by running the machinery to its fullest capacity, it has only been possible to keep in sight of the advanced orders.

De worst ob de imitation ladies isn't always found among de scrub ladies or de kitchen maids.—Son.

BEE SUPPLIES—G. G. Wickson & Co, 123 N. Main Street. Los Angeles, Cal.

TO FIX PRICES ON PRUNES.

The Farmers' Club held a largely attended meeting at San Jose last Saturday to hear the reports of President F. W. Crandall of the Sorosis Fruit Co., and Col. Philo M. Hersey, President of the Santa Clara County Fruit Exchange, who had just returned from a long trip to Europe and the east to get at the exact status of the market conditions and what they could expect in the way of demand and prices.

Both speakers agreed that growers should not sell nor contract to sell unless they got good prices. The merchants are willing to pay a good price provided they know that competitor cannot buy at a lower figure. There is very litle holdover from last year, and Bosnia and Servia will be short; France will be very short, not only on prunes but on apples and all other fruits. In the Eastern States apples are short everywhere with the exception of Michigan and New York.

In foreign markets the California prunes well packed, true to number and not loaded with sulphur, were gaining over its continental competitors.

Col. Hersey said the growers should get 3⅛ cents or more as a basis price. This would leave two and three-fourths cents net to the grower. He thinks an even higher price can be secured, but there would be danger of a large holdover.

Mr. Crandall said the price did not depend upon New York merchants, but on the California growers. He urged that growers stand together and not sell until a price could be agreed upon.

At the meeting a committee of five were appointed to establish a bureau of information on crop and market conditions.

* * *

On the same day the above meeting was held at San Jose, the growers from around Los Gatos held a meeting to organize a co-operative company, when an organization was perfected and nearly 300 tons of fruit were pledged, with prospects of 200 tons more to be added. This organization will install its own grader and packing machinery.

* * *

The San Jose Mercury says the prices set by the Campbell Fruit Growers Union for this year's prunes are three and three-fourths cents basis for four sizes for the October delivery.

STATE FAIR NOTES.

All those interested in the raising of the standard of livestock in this State should attend the State Fair. A higher degree of general excellence in dairy and beef cattle means the addition of many thousands of dollars in value to the farmers and dairymen of the State.

From present indications the demand for room for stalling livestock designed for exhibition at the State Fair will tax heavily the ability of the Society to furnish it as so many have signified their intention of bringing stock to the Fair. Last year a number of additional sheds were constructed at the Park for the accommodation of pure-bred beef and dairy breeds of cattle.

Prof. W. L. Carlyle, of the Bureau of Animal Industry of Wisconsin, who gave such universal satisfaction by his judging of stock at the State Fair last year, has been secured again by the Directors for the approaching Fair.

Breeders of livestock are taking great interest in the coming State Fair and California breeders will not have a walkover, by any means. Parties from other States who are engaged in breeding fine cattle have signified their intention of coming to this State to contest the palm of superiority with home breeders. Oregon will send a herd which has cost the owners a fabulous amount of money.

The exhibits of pure-bred fowls at the approaching State Fair promise to exceed in magnitude aything hitherto made in this part of the State, as promises of over two thousand of all varieties have been received, including both land and water birds, and the competition for prizes is sure to be keen.

The apiarian department at the State Fair promises to be an interesting one.

We can help make people bright by our keenness, but we can never accomplish anything toward making people good except by our tenderness.—C. H. Parkhurst, D.D.

Don't believe all the evil you hear.

NAMES OF FARMERS WANTED.

We want every farmer to read "THE PACIFIC TREE AND VINE," one of the best journals on horticulture, poultry, dairying and home-making published in the West. Twenty-first year. Thirty-two large pages. Subscription 50 cents. Send us five names and addresses and 10 cents for a six months' trial subscription to 918 I street, San Francisco, Cal.

Scott's Wax A SURE CURE FOR Gum Disease

Made after the formula of Mr. John Scott, late Horticultural Commissioner, by

S. M. WOODBRIDGE, Ph. D., So. Pasadena, Cal.

DIRECTIONS—Cut away the diseased parts of the tree, allow to dry, and apply melted wax with a brush.

The Vernon Nursery

We will offer 100,000 deciduous fruit trees for sale next season

If you are thinking of planting it will pay you to give us a call before placing your order

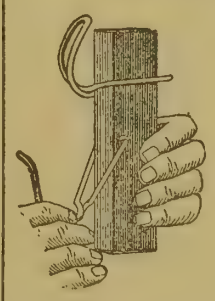
We are headquarters for all kinds of deciduous fruit trees, nuts, grapevines, berry vines and blue gums

A day spent looking over our nursery will be money well invested

A. YARNELL,

Station K, **LOS ANGELES, Cal.**

Be Sure and Get



Woodward's Adjustable Prop Bracket

The Only Bracket That Will Adjust Itself to Any Prop

They are cheaper than any other Prop Bracket that can be made, and will positively not get out of order. No nails or splice to break; no time spent in repairing; can be padded if you wish without nailing. Stand props as near the bottom of trees as possible and they will not be in the way of cultivation. If the Bracket is sprung apart so as to go on partway of the Prop it will take a side hold and will never slip. If the Bracket should be too loose press the sides together so as to make a little friction on the sides of Prop and it will stay in place better while being put up.

Having reduced our price to $17 per thousand, we would be pleased to have a continuance of your patronage and can fill all orders promptly.

J. K. Woodward & Co.

171 NinthSt. Riverside, Cal

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

DECAYED TOOTH.

Editor Cultivator:—I have a Jersey cow 9 years old which came fresh in April, appeared all right but was thin in flesh and did not give much milk; had her dehorned about May 1. She bled profusely but not long and soon after had a swelling on one side of the left jaw; it goes away and comes again. She eats slowly and don t eat more than one-half as much as the other cows, chews her cud as if she had bone in her mouth. The saliva runs out of her mouth, but not very much. She is always loose in her bowels, drinks only every other day. She is getting very thin. Please answer through the Cultivator.—J. D. S., Escondido.

Extract the decayed tooth or irritating object in her mouth, and keep her milking.

CONJUNCTIVITIS.

Editor Cultivator:—A valuable young mare has running eyes. Afflicted for the past year. Under lids are pinkish, sometimes swollen. Is becoming near sighted, shies constantly. Perfectly healthy otherwise. —C. B., San Jose.

Take of sodium hyposulphate 10 grains, distilled water one ounce. Use a quill, camelshair brush and put two or three brushfuls in the eyes three times a day, by holding the lids open with thumb and fingers. Continue the treatment for some time.

California produces seeds to the value of more than $2,000,000. We dictate prices to the world in onion, lettuce, celery and sweet pea seed. In Central California there are about 15,000 acres devoted to the raising of plant and flower seeds.

The Agricultural Department of the State University has received many complaints from bean growers and others of the ravages of small insects.

There is shipped to Eastern markets from California each year from 200 to 500 car loads of honey.

It is now calculated that the total apricot crop of California this year will aggregate about 500 car loads, or only about 40 per cent. of the output last year. Of this amount Ventura county has over 100 car loads.

The California Promotion Committee for nine months ending June 1, 1903, received 42,873 letters inquiring about California. Of this number 4303 came from New York; 3194 from Ohio; 2947 from Pennsylvania.

Orange county has the distinction of having so far raised the largest water melon in California. It weighed 150 pounds and measured five and a half feet in length and four feet and nine inches in circumference.

At this time California has 3,925,000 acres of land under irrigation.

In the canning establishments of Fresno recently the girls employed frequently complained of colic. Dr. Aiken, the City Health Officer began an investigation and found that considerable quantities of caustic soda solution was used to quickly peal the fruit. It is believed that it is this process which affects the health of the employees.

The State Board of Health will take steps to interest the authorities of every city in California in a campaign of extermination of rats as they are unquestionably breeders of disease and spreaders of contagious troubles.

The Pacific Sealing Company report that the salmon pack this year will be short. So far out 98,000 cases have been packed—a shortage of 125,000 as compared to the catch at this date last year.

O. C. Hyatt, of Oakland, has invented a "fruit-picker." The contrivance is attached to a pole and has a finger lever and wire attachment that manipulates a cup-shaped receptacle for the fruit.

DAIRY AND LIVE STOCK

C. B. SESSIONS, ASSOCIATE EDITOR

GREATER CARE IN HANDLING MILK.

The Illinois Agricultural Experiment Station has issued a bulletin of hints on the exercising of greater care as to cleanliness in the dairy. From a sanitary standpoint there is need of improvement.

From the bulletin we quote: No other food will absorb bad odors so quickly as will dairy products, or deteriorate more rapidly under adverse conditions.

Milk being an excellent medium for the growth of bacteria, it is of special importance that it be kept as free from germs as possible.

No other food is produced under conditions where it is so difficult to prevent contamination.

Since the largest amount of contamination comes from the udder during milking it is important that all udders be washed before milking. In the production of milk for direct consumption this is imperative.

The average weight of dirt which falls from muddy udders during milking, is 90 times greater than that which falls from the same udders after washing, and when the udders are slightly soiled it averages 22 times greater.

It is essential to the production of clean milk that the cows be kept out of the mud. The barnyard should have natural surface drainage and should be covered with a coat of gravel or cinders sufficiently deep to form a hard surface at all seasons of the year.

Stables of costly construction are not necessary, but they should be whitewashed at least once a year. In order to acomplish this successfully the sides and ceiling must have a firm tight surface to which the whitewash can be applied.

The floor of the milking stable should be smooth and solid. The platform on wnich the scows stand should be of such length that all droppings will fall into the gutter, thus preventing the cows from becoming soiled when lying down. The stables should be cleaned regularly each day.

As soon as drawn, the milk should be removed from the stable to a clean room provided for the purpose and aerated and cooled at once to 60 degrees F. or below.

All dairy utensils and everything with which the milk comes in contact should be rinsed, thoroughly washed, and sterilized after each using.

Bottles used in delivering milk for direct consumpttion must be thoroughly washed and sterilized after each using to avoid the danger of carrying disease from one house to another.

Every creamery, cheese factory, dairy, and milk depot should have a solid impervious floor. The floor should be well drained by being pitched to a gutter which is connected with a good system of well-trapped sewerage.

The walls for at least three feet above the floor should be of some smooth, impervious material; if of wood above this, they should be kept well painted to facilitate cleaning.

Milk should be conveyed through open conductors whenever possible. When a pump and closed pipes are used they should be so constructed as to be easily taken down and cleaned each day.

Milk cans should be washed, and sterilized with steam at the factory, and some other receptacle should be used to return the whey and skim milk to the farm. If the cans are used for this purpose they should, by all means, be emptied as soon as they reach the farm, thoroughly washed and scalded, and placed on a rack in an inverted position with the covers off.

Dairy markets should be developed by selling products of known standards put up in such forms that the consumer will get the original package and know its grade or quality.—[Kansas Farmer.

BEE SUPPLIES—G. G. Wickson & CO., 143 N. Main Street, Los Angeles, Cal.

Dairying brings in a constant income. The man who sells crops of any kind has to wait until he can market his product once a year. There is little satisfaction in this. It is unbusiness-like to go without cash for fifty-one weeks and then have a lot of money come in at one time. The dairyman has an income nearly or quite fifty-two weeks in the year.

Skill and brain work get better pay in dairying than in any other branch in farming. To produce fine dairy products requires something besides hard work. The dairyman must have knowledge and skill, and must exercise great care.

There is more room at the top, greater opportunity to improve, than in any other kind of hard work. Cows produce from 150 to 500 pounds of butter per year, and butter sells for from ten cents to a dollor per pound. No branch of agriculture shows anything like this or gives such a chance to rise.

The first advantage of dairying is that it takes less fertility from the soil than other branches of farming.

A ton of wheat takes $7 out of the farm and sells for less than $16. A ton of butter takes fifty cents worth of plant food from the farm and sells for from $400 to $600. Comment is needless.

A GOOD JERSEY.

Winksetta's Princess No. 121658 has just completed the first nine months of her milking period, in the herd of W. Leffingwell, Jr., at Whittier with results as follows: milk, 7377.5· estimated butter, 85 per cent. fat, 473.18 lbs. This record is very good on the face of it, but when the circumstances under which it was made, are considered, it is truly remarkable. Winksetta's Princess was moved thirty-five

miles to her new home during the period, and her feed materially changed. She had run with the herd in a corral, and had no especial care. Her grain ration has not averaged over nine pounds per day, and most of that was bran. She was laid up once with an abscess on her jaw, and had her hip knocked down during this period by an acident. What she could do if carefully nursed along, with forced feeding, nobody knows, but as she can handle an enormous amount of grain, and is wonderfully persistent, Mr. Leffingwell believes she could be forced to yield 60 pounds of butter in a year. Mr. L., however, does not believe in such forced tests, and values a cow only for what she can do in dairy form, on a moderate grain ration, such as will not impair her vitality or qualities as a breeder. In other words, he believes in feeding or breeding to secure permanent improvement as opposed to immediate commercial results at the expense of progress.

HOG NOTES.

With hogs, as with other stock, the cost of keep increase with age.

It is not the best of economy to feed all sizes of hogs together.

A mixed ration will make cheaper pork than corn alone.

In no case should pigs be allowed to become muddy in their nest.

Know that every hog comes to his feed at every feeding.

Pigs will thrive better on a variety of feed, including slops, than on any other ration.

If a hog is off feed, try to ascertain the cause. Try a change of rations.

A brood sow will thrive better, keep healthier, and bring better pigs if she has plenty of exercise.

If the farmer cannot grow clover, it will be best not to attempt to keep many hogs.

It is hardly possible to improve any of the standard breed of hogs by a single cross.

While a good, thrifty condition is essential in a breeding boar, an excess of fat is detrimental.

An abundance of good feed, mixed with a good deal of care and attention, will make a young pig thrive.

A sow with a mean, cross temperament is always hard to deal with, and her disposition often causes the loss of a litter.

A ground floor, especially in winter, is preferable, for the reason that the soil retains the heat and is much warmer than plank.

While it is not always best to give the boar the range of the pasture with the rest of the hogs, he should have plenty of room for exercise.

For a breeder the short-built, compact sow is objectionable, because she cannot assimilate sufficient food to maintain a large litter.

To secure good, strong constitutions, the animals should have a strong, firm bone and in size to be in proportion to the general size of the animal.

Bran, oats and oil meal, with good pasturage, makes a good summer feed for growing pigs, even up to the time to begin feeding to fatten.

Corn meal mixes so poorly that it makes a very poor slop. It settles to the bottom of the barrel or bucket so quickly that it is hard to handle with any satisfaction.

BEE SUPPLIES—G. G. Wickson & Co, 123 N. Main Street, Los Angeles, Cal.

THE FARMERS' INSTITUTE AT LA HABRA.

It was the pleasure of a Cultivator representative to drop in for a few moments to the Farmers' institute held on Monday at the school house in La Habra valley, just east of Whittier. The delightful little valley, about four or five miles wide, and ten or twelve miles long, is one of the little protected spots where nature seems to combine many good features. One thing that has always been lacking is the water supply, and it is not as abundant yet as desired, though recently a system has been completed by which many parts of the valley are reached by irrigation water.

The display of vegetables and fruits made at the school house was so large and of such magnificent production that it is apparent that the La Habra people are not absolutely dependent upon any artificial wetting of the ground. This display was composed of pumpkins, watermelons, potatoes, corn and fruits of nearly all kinds, grown without irrigation.

The attendance by the people of La Habra was such that standing room was at a premium. The program, as is usual with these institutes, was made up in part by Prof. Cook and other outside speakers, but largely by local talent. The Cultivator hasn't room for the whole program, but we wish to make a few notes from a talk made by Mr. Leffingwell on dairy farming in that section.

He asked first if that particular section is best adapted for dairying, which he answered in the negative. He said there is nothing like alfalfa as an economical and efficient feed for the dairy cow. But at the price at which water is sold in that valley, it could not be grown. He did argue, however, that as a means of livelihood, until the orchard trees are bearing, there is no equal to the keeping of a few cows; it means certain income, although, as he said, it is not the most agreeable kind of work, in that, that it is confining every day in the year, but as walnut orchards require ten years to arrive at perfect bearing age, something must be grown between the trees meantime. That is unless one has means to live by.

For feed which may be grown between the trees, he spoke of pumpkins, beets, and other root crops and corn for silage. Where five or more cows are kept, the speaker was unqualifiedly in favor of the home separator. He said that he had used it for years, and he had no thought of being without it, and would not even if he had but one cow. It required but a few moments to do the separating, and but a very few more to do the cleaning of the machine. The saving of the cream, specially in hot weather, amply justified the expense.

In the absence of alfalfa, oil cake, cocoanut meal cake were recommended; also the addition of four to eight pounds of bran to supply the needed nitrogen. This latter in case of no alfalfa feed. The yield of butter per year may vary from 150 to 500 pounds of butter. One cow of Mr. Leffingwell's gave a return of 404 pounds, worth in the market $121; another, a heifer, brought in $113, another during nine months gave a total of 7377 pounds of milk, which made 473 pounds of butter, worth $117.95.

These of course are very exceptional figures, and only possible when the very highest grade of cows are used. The average cow, handled by the ordinary rancher, should yield at least 270 to 280 pounds.

One other paper which we wish to give the benefit of later was "Walnut Disease," by E. G. Ware.

Men who mind their own business have very litle competition.

HOGS ON ALFALFA.

Editor Cultivator: Can you give any information as to how many hogs can be kept on one acre of alfalfa grown on good rich bottom land?—W. W. Vernon, San Luis Obispo.

The answer given to that question at the recent Farmers' Institute held at La Habra, was that one acre would support eight hogs. Whether this means with the best conditions, such as rich bottom lands, etc., we cannot say.

Coulson's No. 3 Condition Powder For Poultry

This is one of the Greatest Poultry Foods in the World

The secret formula was invented and is known only by A. R. COULSON, manufacturing chemist. The principal parts are compounded by him, after which they are mixed under his personal care in a large electric mixing machine which mixes half a ton of it in ten minutes. It is put into sacks, packages and cans as soon as it comes out of the mixing machine.

This Condition Powder is Different From Any Other Condition Powder or Egg Food

This condition powder has given such satisfaction that it is used the year round by over a thousand different poultrymen who buy package after package of it. Some of the largest poultrymen use a hundred pounds of it a month. They mix one small cupful in the feed for 100 fowls, which makes them digest food better and lay more eggs and keep healthy.

This Condition Powder Will Cure Sick Fowls

Quicker than any other remedy, it will cure Roup, Cholera, Indigestion, Leg Weakness, Appoplexy, Swell Head, etc., quicker than anything else as it acts on the liver and cleanses the disease and poisonous impurities from the system, purifies the blood and gives the fowls appetite and ambition. It cures roup and swell head because it breaks up the cold and also gives them appetite to eat and helps to digest what they do eat thus giving them strength and health.

When Fed to Healthy Hens

By its aid to digestion it enables the hens to get more strength out of the food; thus they will lay more eggs. Their combs will become bright red and healthy looking, showing good circulation and healthy livers. A great many hens are too fat and lazy; they should be given a good dose of this condition powder along with some protein feed and let them change that fat into eggs. This condition powder develops the pullets and gets the old hens down to business.

This is the Season of the Year That is Hard on the Chickens

A great many chickens and hens will get sick and die during the next two or three months unless the proper precautions are taken. Some will get other diseases.

Disease is easier prevented than cured.

A Dose in Time Saves Nine

To prevent disease and also to cure before too far gone put **COULSON'S NO. 3 CONDITION POWDER** in the feed, a little every day or a good dose twice a week. The moulting season is now at hand and the moult is a great strain on the fowl.

Coulson's Number 3 Condition Powder is the Best Tonic For Moulting Hens

It also contains the ingredients that will make the FEATHERS GROW. It is worth its weight in gold for moulting hens. No matter what food you use mix with it a little of COULSON'S No. 3 CONDITION POWDERS, during the moulting season.

It will increase your profits.

It assures assimilation of the food elements needed for egg and feather making.

It is good common sense to take care of the hens and feed them properly. They will pay you back.

COULSON'S No. 3 CONDITION POWDER makes the hens get down to business, moult quickly and get back to laying in the fall. Try it once and you will always want to use it when you see its beneficial results. We make tons of this condition powder and can furnish you with any quantity.

PRICES—1 pound can 25c. 3 pound can 50c
5 pound package 75c 7 pound pail $1.00
10 pound package $1.35 25 pound package $3.00
50 pound sack $5.50 100 pounds $10.50

SPECIAL OFFER

10 pounds sent, express prepaid, to your nearest express office station in California for $1.50.

25 pounds sent, express prepaid for $3.25. Larger quantities shipped by freight.

The Moult.

It is a great strain on the body of the fowl, and unless properly nourished with the right kind of feed, many hens will die during the moulting season.

It will pay you to spend a little extra on feed at this season and save the hens.

COULSON'S EGG AND FEATHER FOOD is what your hens need, and they need it bad at this season of the year. Poultrymen who fed

COULSON'S EGG AND FEATHER FOOD

last year during the moulting season will feed it again this year, you bet, for they know it is the boss feed to bring out the feathers in a hurry and give the hens a beautiful, glossy plumage. You can always tell a flock of hens that have been fed on COULSON'S EGG AND FEATHER FOOD as they have so much nicer feathers and better appearance.

Can you afford to neglect your hens, when you know that Coulson's Egg and Feather Food must be good, as there are 3000 sacks a month of it being used?

Ask for it at the feed stores, or send to factory.

A. R. COULSON & CO., Petaluma, Cal.

Testimonial

Malaga, July 24, '03.

To whom it may concern:—We, the undersigned, have been using Coulson's Egg and Feather Food since last February, (six months) and find that it does everything that is claimed for it and we are very much pleased with it.

Signed MISS L. M. STUDDARD.
MISS K. L. RICHARDSON.

A. R. COULSON & CO.

Manufacturing Chemists

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

PREPARING FOR EXHIBITION

Success in the show room depends greatly on the exhibitor. First he must be a lover of his birds if he expects much out of the business. He must know a good specimen from a poor one. A good, true fancier is born not made.

In the fall, October, I cull my flock for the last time until there is nothing left but birds I desire for breeding and exhibition purposes. The cockerels are separated from the pullets, and placed in the cockerel pens—yards made for that purpose, large enough to accommodate the number I have and fitted with a good warm, dry house. The pullets are placed in their winter quarters, being careful not to crowd too many in a pen. I now go over and select my exhibition cockerels. This is done fully two months or ten weeks before show season. Each bird is weighed and placed in a separate conditioning coop. When placed in this coop the weight of the cockrell is carefully marked on a card which is attached to his coop.

These coops are arranged so that no direct sunlight strikes them. The same system of feeding is kept up but now I feed the mash at noon and whole corn at night, giving them all they will eat up clean at a feed. Each bird is weighed once a week, and the record made on the card provided. Some weeks one will gain as much as a pound, others a half, but within thirty days you should have put from a pound and a half to two pounds on a bird. Three weeks before I desire to show, any birds I find not up to weight I begin to feed a little heavier and change the feed. I place a tablespoonful of sugar to each bird in the mash. This causes them to take on fat, which can be easily gotten rid of by discontinuing the sugar. I now feed five times a day, adding a feed of corn, bread soaked in milk, and another of hard boiled eggs. They will now add weight rapidly, and there will be no danger of developing too large comb, as would be the result from feeding raw meat, the milk and egg answering the purpose of meat and not endangering the condition of the bird as would raw meat.

The pullets are placed in houses, not being allowed the outside run, and fed and weighed in like manner, placing six to eight in a pen, supplying them with clean straw as often as needed, also grit and oyster shell. It is well to remember that pullets will not do so well—not take on flesh so fast—when confined to a single pen as will the male. They will fret and worry, and at the end of a month will not weigh one ounce more than when first confined. There are exceptions to this rule, but usually the best results come from allowing several of them together.

At the time I select my show birds I go over each specimen, noticing closely if any feathers are broken. If any are found they are pulled out, as they have ample time to grow in again. No stubs on shanks or down between the toes must appear, as many a good specimen has been "thrown out" in the show room for this disqualification, and from among the stock of old breeders too. You will occasionally find this defect among all the breeds, the old time Barred Rocks and Brown Leghorns even throw down between the toes and stubs on the shanks. Therefore do not be conceited and think your birds are so much better than others, but look them over carefully and kill any bird you find with these defects.

Your birds should be handled, groomed and petted each day. Teach them to pose for you. They must not be afraid to be handled, so they will stand erect when posed to do so, to show their carriage well. Here is where you find "typical carriage" of much value. Take a specimen that has been roughly handled and abused every time you go around his coop he crouches down in a dark corner, with tail down and feathers all ruffled up, and you are sadly reminded why this section was placed on the score card. I always treat my birds with as much kindness as possible, and find that it is much appreciated by them, and that I am fully repaid for my trouble in the show room. A carefully groomed bird shows to the greatest advantage and will get all that is coming to them when the judge passes on the class while the bird that has not been petted and handled will not show their good qualities and strong points in shape and lose much thereby. After the birds have become used to their new quarters, about twice each day place a pedestal in front of the cage, open the door and coax the bird out by talking to it and offering feed in your hand. When you place your hand in the cage, put it under them rather than over, and petting one, always keep your hand below the eyes. They do not like to be rubbed on the back or tail, and it is only after they are perfectly gentle that they will allow it. First place the fingers under the throat, gently rubbing upwards; after the bird gets used to this, place your hand well down between the legs and draw it up the reverse of way the feathers lay. If bird seems uneasy, gently repeat rubbing of the throat again and again until you have your bird sufficiently tame to allow of more thorough handling, then pose him in different positions until you feel you have found the one best suited to him, and in the future only pose him in that one position. At first you will have some difficulty in getting him to stand as you desire, but gradually he will pose for you all right. Just as soon as you get him to stand in correct position study to keep him there. Move back a step or two from the cage with uplifted hand and finger pointing direct at the bird, move up and rub him under the throat, repeating the operation, and in a comparatively short time you will find you can pose a bird and go back thirty yards, and have him stand in position for a full minute and never move. Always use the same tone of voice; always assume the same position when training and above all things keep your temper if you expect to succeed. Should the bird fly down, back him up in some corner and talk to him all the time until you have him in your hands again. Do not run after him but use this gentler method, and you will soon gain his confidence. There is some work about this, but it is the only system of teaching the birds to pose as he should.—Theo. Hewes in From Shell to Show Room.

The Health Department of the City of Los Angeles has ordered the removal of the pigeon ranch located at Arroyo Seco, near Los Angeles. This is the largest collection of pigeons in the world, and has been quite a picturesque feature of suburban Los Angeles. The removal is ordered because of the contamination of the Los Angeles river.

If poultry and garden truck can not be raised on the same piece of ground, and they can not very well, poultry and orchard go well together. The one helps the other and the two make a profit.

STANDARD REVISION.

What is the "Standard" and what is meant by the "revision of the Standard?"

The American Standard of Perfection is a book issued and copyrighted by the American Poultry Association, giving a full description of each of the popular breeds known in America. This book is revised about every ten years. That is the descriptions are carefully studied over by committees appointed for that purpose of breeders or judges of the different varieties.

This year these committees are in session, and to assist them in their labors they have asked for the opinions of the large breeders of fancy poultry, and the discussions, especially on the plumage of the Barred Rocks, have been very animated.

The question as to the wisdom of having an illustrated Standard or not has been decided in the affirmative and some of the finest artists have been engaged to make pictures of the most popular breeds.

The illustrated Standard will be a great boon to beginners in the poultry business, especially to those desiring to raise prize-winners. We can then take a fowl, put it into a coop, sit down with the Standard of Perfection open, compare with the picture and with the description and judge for ourselves how nearly ours resembles the perfect fowl. Choose those nearest perfection for the show room or for the breeding pen. A poultry raiser cannot afford to be without the American Standard of Perfection.

* * *

Poultry breeders, to make a success of it, must keep on improving their flock every year; there is no standing still in the poultry business. It is either a climbing up to success or a slipping back down hill into mediocrity or even into failure.

One great means of success is the poultry show. It is a satisfaction to those that win, is a stimulus to those who see the winners to keep on improving their own breeds.

The shows are an education, and it gives us great pleasure to note that the Los Angeles County Poultry Association has engaged Hazard's Pavilion for a large poultry exhibition.

THE CHICKEN SHOW.

"What is a chicken show," she asked.
Her pa looked wise and smiled.
"'Tis where the chicken cranks all meet,
And fuss and cuss the judge, my child."
—Francis E. Bates in Poultry Gazette.

Do not allow a lot of hens that persist in sitting after it is too late in the season to occupy the nests in the chicken houses. They will succeed in hatching a brood of vermin, no matter how clean the premises. A Few Hens says, "When a hen sits it is her vacation"—better make them spend the time in a shady back yard, where there are no nests to get into, and let a cockerel keep company with them.

If cleanliness, good care and proper feeding are properly observed there will be little chance to "doctor" fowls.

Do not allow ducks to run in the same yard with chickens; they will befoul the drinking water and cause trouble in other ways also.

There should be more brooms worn out in the poultry yard than there are.

Clean water in clean drinking vessels is strictly necessary at all times.

Cleanliness in the poultry yard and houses is the key to success; the lack of it invites all kinds of diseases.

See that fowls and chicks have good, freshly turned up and finely pulverized earth dust baths in shady places.

Continue the preventive methods to keep down vermin; no matter how favorable the indications may be they are not there.

Management has as much to do with success as good stock, houses and proper feeding. Management is the regulator or safety valve of any business.

It is claimed that when they have a free range, a bushel of grain will feed a hen one year.

THE CITY POET ON THE FARM

Oh, for a life in the country free,
Where the sighing wind in the sweet-corn tree
Mingles its music, drowsy and low,
With the song of the milkmaid, as, to and fro,
Through the sunny pastures she skips about,
Milking the milkweeds with many a spout.

How sweet are the wee white Leghorn lambs,
That scamper about with the half-grown hams,
Barking in glee at the farmer's lad
As he wades in the brooklet, fishing for shad,
While out through the barnyard come strident notes,
For the farmer is busy a-shearing the shotes.

Oh, a country life is the life for me,
Where the neighing calves go frisking free:
The swallows cackle at sunset hour,
As they sip the dew from the whole wheat flour,
And early to roost the ravens go,
For at morn they must clap their wings and crow. —The Journalist.

POCKETSFUL OF SUNSHINE

A pocketful of sunshine
Is better far than gold;
It drowns the daily sorrows
Of the young and of the old;
It fills the world with pleasure,
In field, in lane, and street,
And brightens every prospect
Of the mortals that we meet.

A pocketful of sunshine
Can make the world akin,
And lifts a load of sorrow
From the burdened backs of sin;
Diffusing light and knowledge
Through thorny paths of life;
It gilds with silver lining
The storm clouds of strife.
Ladies' Home Journal.

THE PLOUGHMAN

He draws a jagged wound across earth's tender breast,
And drops to warm embrace the grains of corn.
With salve of sun and rain the wound is gently dressed,
Then—miracle of God—a crop is born.
By Edwin Carlile Litsey.

AFTER THE WEDDING.

The wedding was over. The bride and groom had driven away in a multihued shower of confetti. With light words of congratulation fresh on their lips the guests in their turn had departed from the Jenkins mansion, leaving in their hosts' breasts an awful emptiness suggestive of lonely tomorrows and next days.

Silently the bridegroom's father and mother got into their waiting carriage. Both were deep in thought. What the occasion meant for them however, neither Mr. nor Mrs. Ellery had grasped. The ceremony occupied their minds as a present fact, not as a forerunner of the future. Their son was still their only son, his wife was the girl whom he had just married with ostentation that had broken in upon the sober routine which the Ellerys had come of late years to regard as life.

As they went homeward through the streets that looked strange under the flickering gleam of the arc lights the mother tried by words to grope her way through the feeling of change that was beginning to oppress her.

"It seems as if Willie was a baby only yesterday," she said. "Her hair looks like his used to, soft and yellow. I've got his curls put away in a box somewhere."

The old man spoke in turn, but not to answer. His speech went out to meet the worldly vision in his own mind: "It's a good thing for the boy, Maria. Minnie's a nice girl, and old Jenkins is millionaire."

Both slipped back into silence. There was nothing more to say. They felt themselves explained, and the monosyllabic habit of tired old age restrained them. Inevitably they drifted into the reveries for which experience prepared them. The father scanned anew the ambitions of his youth which lack of money had hindered.

They seemed to him within easy reach of his son, more fortunate. The mother lived again through the hopes of her young womanhood. From out the display of the evening the brilliant crush of guests, the magnificence of the background, one form stood before her—the bride's, all white except the bright head that crowned it. As the woman looked the years fell away from her own slight shoulders. That other scene, long since grown dim upon her sight, grew clear again. She saw herself a bride, with all the promises of love fresh in her heart. She held her head up proudly beneath the orange blossoms. Happy and tremulous she looked with young eyes through the veil upon a familiar world that yet was new.

The haunting sweetness of her eyes grew sorrowful. In her husband's face, lined with care, heavy because of its settled features, in the drooping lines of his form she saw herself as in a mirror; she was old despite her dreaming.

Slowly they walked up the slippery pathway together, each steadying the other. While her husband fumbled for his latch key Mrs. Ellery looked about her, her lips tightening. The scene before her doorstep, humble in itself but rich in association, soothed the loneliness by its familiar aspect. How often she had stood there, waiting for her husband's homecoming. How often she had watched her boy off to school, going forward to the edge of the porch so that the climbing vines should not obstruct her view of him as he trudged whistling down the road, swinging his books recklessly about his heels. How often in more recent years she had pursued with yearning tenderness his retreating figure. Before her, in winter vesture, lay the little garden she had tended every season; above her clung the rosebush that had made her dooryard glorious in June.

The door was open, and she followed her husband into the house in a mood that took no account of time or change, the exaltation to which the sight of well-loved common things will some times lift the spirit. She started up the stairway. She could hear her husband's footsteps coming up behind her. They echoed in the vacant house as she had never heard them. The consciousness of some omission struck her. She turned back with swift comprehension.

"The light," she said, "you have not put out the light."

A startled expression came to the old man's eyes. The deep red flush of pained surprise forced itself from his thick throat to his forehead. For many a day he had been used upon going to bed to leave the hall light burning.

The mother's lip trembled. Her left hand, as she glanced over her shoulder, pressed more heavily on the banister. "He will not come home tonight William," she faltered.

With an effort Mr. Ellery reached up and turned out the gas. In the darkness the two old people plodded wearily up the stairway.—C. R. H., in Chicago Tribune.

DRY DOCK ROMANCE

They got on the subject of June weddings.

"Where'd you rather spend a honeymoon?" asked one of the two men.

"Well," answered the other, "all things considered, I think the ideal place for a honeymoon is on a schooner at a Hoboken dry dock."

Then, of course, he had to tell a story.

The schooner was just up from the Caribbean and had gone to a dry dock in Hoboken to be refitted. The dry dock people were having their busy season just at that particular time and the schooner had to wait a week or two before the workmen had a chance to lift her from the water. So the craft lay free at the piles and the crew was discharged.

The skipper was in love. In fact, he had for some time been engaged to marry, and being an energetic son of Maine, he sent this telegram to his betrothed, a New Orleans girl:

Out of a commission for a month or so, but must stay here just the same. Good time for splicing. Cut all loose and come at once. Never mind new togs. BOB.

She came on, they were married forthwith and then began to spend their honeymoon. And if you will believe people who know all about it, that honeymoon was the greatest ever devised and excuted anywhere. Harry, the younger brother of the head draughtsman of the yard, was probably the first to find out much about it. From here on it's Harry's story.

"The first time I ever saw Capt. Bob" he said, "was when he came down the pier with a big bundle of stuff under his arm—stuff from the grocery I guess. Good-looking? Well, I should imagine! Light hair, sunburned face, square jaws, sharp eye the walk of a man who knows his business. Well, he was all right.

BROWNSBERGER HOME SCHOOL
STENOGRAPHIC AND BOOKKEEPING
CLASSICAL COLLEGE PREPARATORY DEPTS.
953-955-957 West Seventh St., Los Angeles, Cal.
Pleasant study in the midst of the most beautiful home-like surroundings. Day and evening sessions. Shorthand made easy by famous "Chalk Talks" by the Principal. Machine at home free of charge. Spanish at lowest rates. Every graduate in a position. Ten teachers. Largest capacity in the city. The Bookkeeping is the famous Bidget System. Classical College Preparatory Dept. fits for State University. Send for illustrated Catalogue. FLORIDA BROWNSBERGER, Principal.

SOUTHERN PACIFIC
CHOICE OF 3 ROUTES
EAST AND WEST
"SUNSET" Via El Paso and New Orleans
"OGDEN" Via San Francisco and Portland
"SHASTA"
The service on these trains is perfect. The time is the fastest. The scenery most beautiful. The tourist car service appeals most directly to those who desire to travel at a high rate of speed, but prefer to economize a little on sleeping car accommodations The Southern Pacific runs personally conducted tourist excursions every day in the week at reduced rates to various points in the east, without change, via all routes. A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.
SOUTHERN PACIFIC
261 SOUTH SPRING ST.

"Probably I shouldn't have paid much attention to him if it hadn't been for one accident. The ladder that was hanging over the side of the schooner didn't reach the float by several feet. There was a rope over the side against the ladder.

"I was wondering what good the rope would ever do any body but a professional acrobat when he grabbed the end of it with his right hand and with the greatest ease in the world raised himself up the ladder. Then with a peculair little twist he swung himself over the ladder and climbed up to the deck as cool as a cucumber.

"She was waiting for him, of course. The way in which she was got up would have struck any eye. Black hair, red kimono, shirt with blue dots, a mighty pretty face and all the other things that go to make a bully looking young woman.

"She kissed him as he came over the rail and then walked aft. He threw his bundle to the negro cook, twirled his straw hat into the cabin and lounged into the hammock that he had rigged up under an awning. As he sat there she sank down upon a deck stool in front of him and held her hands on her knees as she gazed at him.

"It was as pretty a picture as you'd ever see anywhere. I made up my mind then and there that they had just been married, and so it turned out. The ceremony had been performed on the deck of the schooner by a minister from some sleepy little New Jersey hamlet and the cook had been the only witness.

"It isn't hard to imagine that there was no better place in New York and its vicinity to spend a honeymoon than on that schooner. You see, there was nothing but exclusiveness, especially after we chaps, who had been going in swimming had been warned that we'd have to be careful not to ejaculate too much. Besides that, there was a heap of comfort aboard.

"Every other evening or so Capt. Bob and Mrs. Captain Bob went over to New York, saw the electric glitter of the Tenderloin, ate a table d'hote dinner and viewed a roof-garden show or something of the sort. Some evenings they sat alone on deck and watched each other and the twinkling lights.

"In the day time there was a great chance for sightseeing in the one city where one can find all the big sights one wants. Capt. Bob could steer a horse as well as he could send his vessel along and several times he hired a runabout and took his wife over all the country nearby.

"On some evenings they entertained aboard and those entertaiments were simply great. Capt. Bob bought a piano the first day for his wife to play and sing by, and she had a guitar, and a voice as sweet as her face.

"He was no slouch of a singer himself. He had one of those barytone voices that no fog on the sea could ever spoil and what the two couldn't do in the way of a musical entertainment wasn't worth doing.

"Jim, the negro cook, musn't be forgotten. He was a perfect sharp on fixing up ices and dainties and that sort of a thing. Well, just think what fun a party could have in such a place, with such people and with such cool breezes, myriads of sparkling lights, swishing waves and all those things.

"Yes sir, a honeymoon on a schooner in Hoboken is all right if you have the real artistic sense."—N. Y. Sun.

HOW TO MAKE HASTE.

Do you know how to hurry? This is a hurrying age, and you ought to know how to keep up with it—if you think it worth while. These suggestions come from busy men:

1. Do nothing that you don't have to do. Cut out the non-essentials.

2. Don't hesitate. Begin at once. Stop when you are through, and begin on the next thing.

3. Don't be too particular what part of the job you begin with. Other things being equal, do what is under hand first, and the next nearest thing next.

4. Don't pause between jobs.

5. Do your thinking while you are acting, and think about the work in hand.—Ex.

Despite laws against adulteration, "olive oil" is secured from the cotton plant, marmalade fro mthe turnip, and cherry jelly from the foot of a calf.

HOMELY HINTS.

Ink stains can be removed from white linen by oxalic acid, chlorinated soda or lemon and salt. The material should then be laid in the sun and wet from time to time with lemon juice and washed in warm water. The application should be repeated if necessary.

If mildew on linen hasn't been thriving very long, try washing with lime water. This also must be rinsed out very carefully, for it has a way of weakening the cloth. Take a spoonful of chloride of lime to a quart of water for the preparation. Soak yellow clothing in it for several hours and then hang it in the sun, after rinsing, for a good bleaching.

Try a bit of camphor in the reservoir of a lamp and see if it doesn't cause a brighter light.

Burn some alum and pound it real fine, then sift through course muslin and it is already to brighten steel ornaments. Use it dry with a soft brush. Of course burnt alum can be bought at the druggists already powdered. Emery powder also will often make small spots of tarnish disappear from steel.

Kerosene and gasoline is always a good old standby. If a metal or porcelain tub gets discolored from the drippings of water, or even for want of a little frequent care, it comes to the rescue.

Varnish stains on clothing usually yield to the influence of alcohol. Just wet the spots with it and let the cloth lie for a moment and again sponge with alcohol. Chloroform ought to restore the color if this has faded the fabric any.

Down quilts can be given new life in the same way, and feather beds left out of doors all day will resemble the softest down.

Do not hang feathers in the sun, for an oil exudes from them which causes a decided odor, and is apt to discolor the covering.

Articles stuffed with down can be hung directly in the sun for a few hours.

A good way to kill weeds on a gravel or cinder walk, is to apply a strong solution of copper sulphate.

THE TRUTH OR NOTHING.

One of the striking traits of Gen. Ulysses S. Grant was his absolute truthfulness. He seemed to have an actual dread of deception, either in himself or others. One day while sitting in his bedroom in the White House, where he had retired to write a message to Congress, a card was brought in by a servant. An officer on duty at the time, seeing that the president did not want to be disturbed remarked to the servant: "Say the president is not in." General Grant overheard the remark, turned around suddenly in his chair, and cried out to the servant: "Tell him no such thing. I don't lie myself and I don't want anyone to lie for me."

HE CATCHES IT.

Though a martyr to dyspepsia
Quite an appetite he had.
He's a sufferer by proxy,
It's his wife who has it bad.

HER FEAR.

The Bore—I'm not feeling at all well this evening.

The Belle—I hope it's not a lingering illness.—Kansas City Independent.

Mrs. Hiram Offen—"That will do! You'll leave on Saturday, and you needn't bother me about a recommendation."

Bridget—"Shure, Oi hov no intintion of givin' ye a recommindation. Oi'll tell the truth about ye to ivery gurl that axes me."

An Irishman was walking with a friend past a jewelry shop. The window was filled with precious stones. "Wouldn't you like to have your pick?" asked Larry. "Not me pick," said Mike, "but me shovel."

In a general way it pays better to go fishing with the boys than it does to lick them.

He boiled the water that he drank,
By rule he slept and ate;
He wore hygienic underclothes
To get the bulge on fate.
Thus science served him faithfully
And made him microbe proof,
But yesterday he met defeat
By falling from a roof.

Chicago Record-Herald.

RECIPES.

BEEF LOAF.—Three pounds of beef from the round, three-quarters of a pound of pork; put through grinder; add two well beaten eggs and three-quarters of a cupful of cracker crumbs, even teaspoonful of salt, one-half teaspoonful of pepper. Mix thoroughly and place in greased pan. Sprinkle top with flour and dot with butter. Pour one cupful of water around, and bake one hour in hot oven, basting frequently. Serve in a chop dish, surrounded with browned potatoes and parsley. Potatoes can be browned in pan with loaf.

* * *

CREAMED RICE.—Wash and pick over one cup of best rice Put into hot water to cook slowly until about half done. Then add sweet milk, a little salf, and sugar to taste. Continue the cooking until thick and creamy, and the rice perfectly soft. Raisins may be used if desired, or a little nutmeg may be used for flavoring. Serve warm or cold. A good and inexpensive desert, one of which children especially, are very fond.

* * *

MUTTON BREAKFAST BALLS.—To one cup of cold mutton coarsely chopped add a little piece of chopped ham or pork, a little sage, half a teaspoonful of kitchen bouquet, and half a cup of bread crumbs into which has been mixed two tablespoonfuls of melted butter. Blend together with a beaten egg, and add salt and pepper as needed. Take a tablespoonful of this mixture, make it into balls, dredge them with flour, and fry them quickly in hot fat.

* * *

Guava Jelly.—Some, when making guava jelly, take the pulp after the first straining and add a little more water, cook up well and strain again. This is added to the first juice. Then proceed as in general directions for jelly making.

TO GLACE FRUIT.

The following request is in from Hanford, and the Cultivator has tried to get from subscribers a good recipe for glace fruit. This one has been received and if Cultivator readers can give a better one will they please send it in?

Editor Cultivator: Will you kindly furnish me with a recipe for glacing preserved fruit such as apricots, plums, etc. Please answer through the Cultivator. M. N. N.—Hanford.

The fruit used must be preserved in thick syrup, if one year old, the better. Drain the fruit from the syrup and lay in the sun for one or two days, then sprinkle with granulated sugar.

Some re-dip the fruit, using a heavier syrup and continue the drying two or three times.

MOONBEAMS.

The elm tree's shadow on the lawn
By moonlight level spread,
Is like a spider's swaying form
Dropped from a silver thread.
I like to watch it, shadow-drawn,
Before I go to bed. —Ex.

They met within the darkened hall;
He said, "I've brought some roses."
Her answer seemed irrelevant;
It was, "How cold your nose is!"
Her answer seemed irrelevant—
But, when you've recollected,
Then you can plainly see that it
Most closely was connected.

Mrs. Vane: "What a man Mr. Jones is to flatter! He told me today that I looked young enough to be my own daughter."

Mrs. Blunt: "Your own daughter by a former marriage, he probably meant.'

"I don't think Papa cares much for you, Fred," she whispered softly. "That's all right," he replied, "forewarned is forearmed, you know." "Wouldn't it be nice," she continued, in a much lower whisper, "if you were really four armed?"—The Epoch.

AS DEFINED.

"Say, mamma," queried little Mary Ellen, "what's a dead letter?"

"Any letter that is given to your father to mail, my dear," replied the wise mother.

The world wants men who can produce results—results are possible by hard work; will you pay the price?

The world is short on talents, not on places.

Los Angeles Markets.

LOS ANGELES, Aug. 20., 1903.

The same sixty cent quotations are still made on B. of T. creamery with fairly firm markets, although there is a large storage and eastern supply.

Eggs are taking a slight advance, and the demand is cleaning up the light receipts. Good stock readily commands full quotations.

Good potatoes are exceedingly scarce, and there is much eagerness to pick up every stock which comes in.

Vegetables as a general thing are in excellent supply, with fairly easy market.

In dried fruits there is no particular move, and quotations on 'cots may be considered as from 5 to 7 cents. A few sales have been reported at 7, or slightly in excess of 7, but this is exceedingly rare.

Peaches are not being quoted on the coming crop.

Hay and grain are moving very firm.

Walnuts are dropping from the trees and the promised output is shrinking. Estimates now range from one-third to one-half an average crop. Offers of 10½ cents for orchard run are made, with the probability of a much higher price later.

Tree Spray Distillate

Not an emulsion of oil and caustic soda, but a special distillation of oil from which all asphalt and other deleterious substances have been removed. Mix with water and apply with spraying apparatus that gives a thorough and constant agitation to the liquid—when properly done we guarantee that it will destroy all insect life attacking either citrus or deciduous fruit trees and not

Spot Fruit or Hurt Tree

Cheapest and Best Insecticide. We also manufacture **Gas Engine and Stove Distillate, Lubricating Oils, Etc.** We solicit your correspondence and orders.

San Francisco Markets.

Dairy.

San Francisco, August 20.

Butter has taken a material advance during the past week, and it is coming closer to the usual mid-summer mark. Not only are the quotations higher, but the tone of the market is firmer than for some time. Even medium grades of butter are going off well at full quotations. The daily receipts of Coast butter have been reduced to almost one-third of that of April and May. It now aggregates in the neighborhood of 30,000 pounds.

Quotations are:

BUTTER—Per lb:

Creamery extras	28	
Creamery firsts	26	@27
Creamery seconds	24	@25
Dairy extras	24	@25
Dairy firsts	21	@23
Store	18	@20

Cal. Creamery, mild new, choice	13½	@14
Young America	14	@15½
Eastern, New York cream, Cheddars and flats, new	14½	@16

Eggs and Poultry.

The receipts of choice eggs are materially decreasing with nearly 2 cents advance during the past week. Daily local receipts are about 627 cases. The poultry market is very satisfactory to the selling interests though there has been an increase in arrivals they are all well cared for, however, within the quoted range of prices. Large young stock is quickly picked up. Quotations are:

EGGS—Per doz:

Ranch, selected large	29	
Ranch, good to choice	27	@28
Store	20	@25
Eastern	18	@22

POULTRY—Old Roosters, per doz., $450@5; Young Roosters, $5@6.50; Fryers, $3.50@4; Broilers, large, $3@3.50; small, $2.25@2.50; Hens, $4@5; Ducks, per doz., old, $3@4; young, $3.50@4.50; Turkeys, nominal; Geese, per pair, $1.25@1.50; Goslings, $1.50@1.75; Pigeons per doz., young, $1.50@1.75; do, old, $1.50.

Hops.

The prices for new crop are 19@20c per lb., according to quality.

Eastern Markets.

New York General Market.

GENERAL EASTERN MARKETS.

CHICAGO, Aug. 19.—There was a fairly steady opening in wheat; due to reports of continued wet weather in the United Kingdom, and September opened a shade lower to a shade higher at 80¾@80⅞. Local longs showed a disposition early in the day to buy back some of the wheat they had sold out during the past few days, and were encouraged in that by the action of cash houses, which bought freely of the September delivery. This demand resulted in a better tone during the first half hour when September sold up to 81⅝, but later in the day reports of bad weather in the Northwest, together with a better field than had been expected, caused heavy liquidation and prices declined rapidly. A break of 2 cents in the price of the cash commodity at Minneapolis, heavy receipts at all primary points, and light clearances added to the weakness and started a stampede to sell by local longs which resulted in September declining to 89⅜. Covering by shorts during the last half hour caused a sharp rally and the close was near the top, with September ⅜ to ½ higher at 81½. There was covering in corn early in the session on firmness in wheat, and with light offerings the market became firmer. September closed a little higher at 52¼: Oats were independently strong throughout the entire day. September closed ½c higher, at 34½.

Cash quotations were as follows: Flour easier; No. 2 spring wheat, 82@83; No. 3, 78@81; No. 2 red, 79¼@81; No. 2 corn, 51¼@51⅛; No. 2 yellow, 52@52½; No. 2 oats, 34¼; No. 2 white, 33; No. 3 white, 34¼@35; No. 2 Rye, 51½; fair to choice malting barley, 46@53; No. 1 flaxseed, 96½; No. 1 Northwestern, 1.01.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	85,700	11,000
Wheat, bushels	212,300	57,500
Corn, "	366,000	209,600

Rye, "	10,500	......
Barley, "	11,000	2,500

On the Produce Exchange today the butter market was steady; creamries, 14@19; dairy, 13@17; eggs, steady at mark, 14@15½; cheese, steady, 10@11½.

Chicago Live Stock.

CHICAGO, Aug. 19.—Cattle—Receipts, 18,000; Texans, 1500; market steady; good to prime steers, 5.10@5.60; poor to medium, 3 65@4.90; stockers and feeders, 2.25@4.00; cows, 2.50@4 40; heifers, 2.00@4.95; canners, 1.50@2.60; bulls, 2.00@4.30; calves, 2.50@7.25; Texas-fed steers, 3.25@4.40; western steers, 3.25@4.45

Hogs—Receipts today, 25,000; tomorrow, 20,000; market good, steady to strong; mixed and butchers, 4.50@5.65; good to choice heavy, 5.15@5.45; rough heavy, 4.75@5.75; light, 5.30@6.00; bulk of sales, 5.15@5.45. Sheep—Receipts, 25,000. Sheep and lambs steady to 15c lower; good to choice wethers, 3.25@3.65; fair to choice mixed, 2.50@3.25; western sheep, 2.75@3.50; native lambs, 3.25@5.75; western lambs, 4.50@5.50.

California Dried Fruits.

NEW YORK, Aug. 19.—The market for evaporated apples is rather higher and quieter. There is a good demand, with outside prices rarely obtainedable; common, 4@5½; prime, 5¾@6; choice, 6¼@6½; fancy, 6¾@7½. Spot prunes are in good jobbing demand, and show no material change, either in prices or general conditions. Quotations range from 3@7 for all grades. Apricots are firm. New crop choice are quoted at 9@9½; old, choice, 8@8¾, and fancy at 10@12½. Peaches are moving a little better, and rule firm at 7@7½ for choice, and 8@10½ for fancy.

NEW YORK GENERAL MARKET.

NEW YORK, Aug. 19.--Wheat—Spot firm; options closed higher; May closed 88¾; September, 86½; December, 87¾. Hops firm; Pacific Coast, 1901 crop, 15@17; olds, 7@9.

CITRUS MARKETS

THE ORANGE MARKET.

The past week has shown a great deal of indifference on the part of dealers for oranges and has been rather disappointing as a rule. Auction markets have been quiet at a lower range of prices, only strictly fancy stock bringing values that would be satisfactory to the shipper. The supplies in these markets are more than ample for their present needs and the prospects are for little change in the situation. Western markets have been using but a small quantity of fruit and evidently have such a supply of deciduous fruits, etc., as to limit the demand very materially for oranges. Shipments have been light so that there should be no particular change as to values.

THE LEMON MARKET.

The lemon market continues in very bad shape. The number of foreign lemons in sight for the next thirty days is equal to that of last year, and prices are low, weak stock selling for $1.00 to $1.50. The Western markets have been using but a limited quantity. Where sales can be made at all, fair prices can be realized. Stock in poor condition cannot be sold at any price, and when diverted and sold in auction markets the results are disastrous. Shipments have been light and with the last end of the foreign crop arriving in poor condition and unsatisfactory as to the sizes will create more demand for Californias, which will be in better condition and should show good keeping qualities from now

AUCTION SALES.

NEW YORK, August 12th.
Market lower on 80s to 126s; stronger on 150s to 250s.

MARKET NOTES.

Report of the U. S. consul, C. P. Nason, Grenoble, France, on the walnut crop, made on July 25th.

This year's crop of walnuts in the valley of the Isere (France) promised to be an excedingly good one, large in quantity and bountifully laden with fruit. The young nuts, now about the size of ripe plums, are well formed and in a very normal state. it is however, much too early in the season to attempt an estimate of the probable yield, because of the variable weather conditions which may obtain before the ultimate harvest.

(S. Crowinshield,) U. S. consular agent in Italy reports:

LEMONS, This summer's crop will be a good average, larger than that of last year, but the fruit leaves something to be desired as regards size and appearance, and the quality not being up to the usual standard for keeping, will not permit of more than one-half being shipped to places like the United States, where a long voyage is necessary. Therefore, it is quite probable that shipments to America will fall short of the usual.

As to walnuts, the same agent also reports: It is as yet much too early to give any definite idea as to the prospects for the new crop. The trees, however, gave good blossom, and this would point to a good average crop, provided, of course, that we have good weather between now and October, when the shipping season commences.

The grain crop of this state is far below the average according to the estimate of the State Board of Trade, but the hay crop will be one of the largest ever produced in the state.

Advices from the north concerning prunes say that export orders are much lighter in volume than one year ago. Indications point to a slow market for a little time at least, as the buyers for wholesale and jobbing houses have positive instructions to buy absolutely for immediate requirements only. Speculators are not in evidence. Last season at this time the large buyers were taking eveverything in sight. Unfortunately the deliveries last season were very late, goods arriving long after the season was practically over, and dealers were compelled to carry over a large line. Again the foreign buyers last year purchased large quantities early in the season. The export of prunes for the twelve months ended June 30, 1903, was 66,385,000 pounds; this made quite a hole in the prune crop of 1902.—L. A. Times.

The total export of cured apricots last season was 9,190,000 pounds, compared with a total of 1,928,000 pounds for the year ending June 30, 1902.

Orders for walnuts are now being freely received. Eastern buyers prefer the California to imported nuts and, owing to the shortage this year, are placing orders early to secure as much as possible of the crop. The price for the coming crop is not yet made.

FRUITS AND VEGETABLES.

There is a slightly improved tone in the fruit market, especially along the line of peaches. Canners are still holding about the same prices as last week, viz., 15 to 20 for frees, and 20 to 25 cents for clings. In the local way the frees are reported rather easy in the market, and plums are situated about much the same as last week with very limited demands for shipping purposes. Apples are being shipped out in liberal quantities, but under equally liberal supply, the prices are only slightly increased than last week's quotations. There are abundance of crab apples in the market at rather easy rates. Oranges and lemons are rather featureless, only one car load of Valencias being reported.

Practically the same prices prevail on melons though large quantities are being daily received.

One feature of the market has been the first receipt of Royal Isabella grapes, four baskets of attractive fruit being sold at $2.25. Berries are slow and sales indifferent.

The recipt of potatoes are slightly less liberal, but there appears to be no material appreciation in price, notwithstanding the buyers are shy to make purchases at present rates. Sweet potatoes are coming in more plentifully. There is but slight change in the summer vegetables. Tomatoes remain firm, with all fancy stock quickly picked up.

Los Angeles, Cal., June 30, 1903.

The following named children have been received in the Boys' and Girls' Aid Society Home since April 1st.

Half orphans: William Higgins, male, aged 11 years, light hair, blue eyes; Harry Higgins, male, aged 10 years, light hair, blue eyes; Rowland Higgins, male, aged 8 years, light hair, blue eyes; Harry Higgins, male, aged 6 years, light hair, blue eyes; Ruby Higgins, female, aged 4 years, light hair, blue eyes; Peppa Bailey, female, aged 3 years, black eyes, dark hair; Roberto Bailey, male, aged 4 years, dark hair, black eyes; Gertrude Chapman, female, aged 6 years, dark hair, black eyes; Chester Garwood, male, aged 9 years, light hair, blue eyes; George Garwood, male, aged 11 years, light hair, blue eyes.

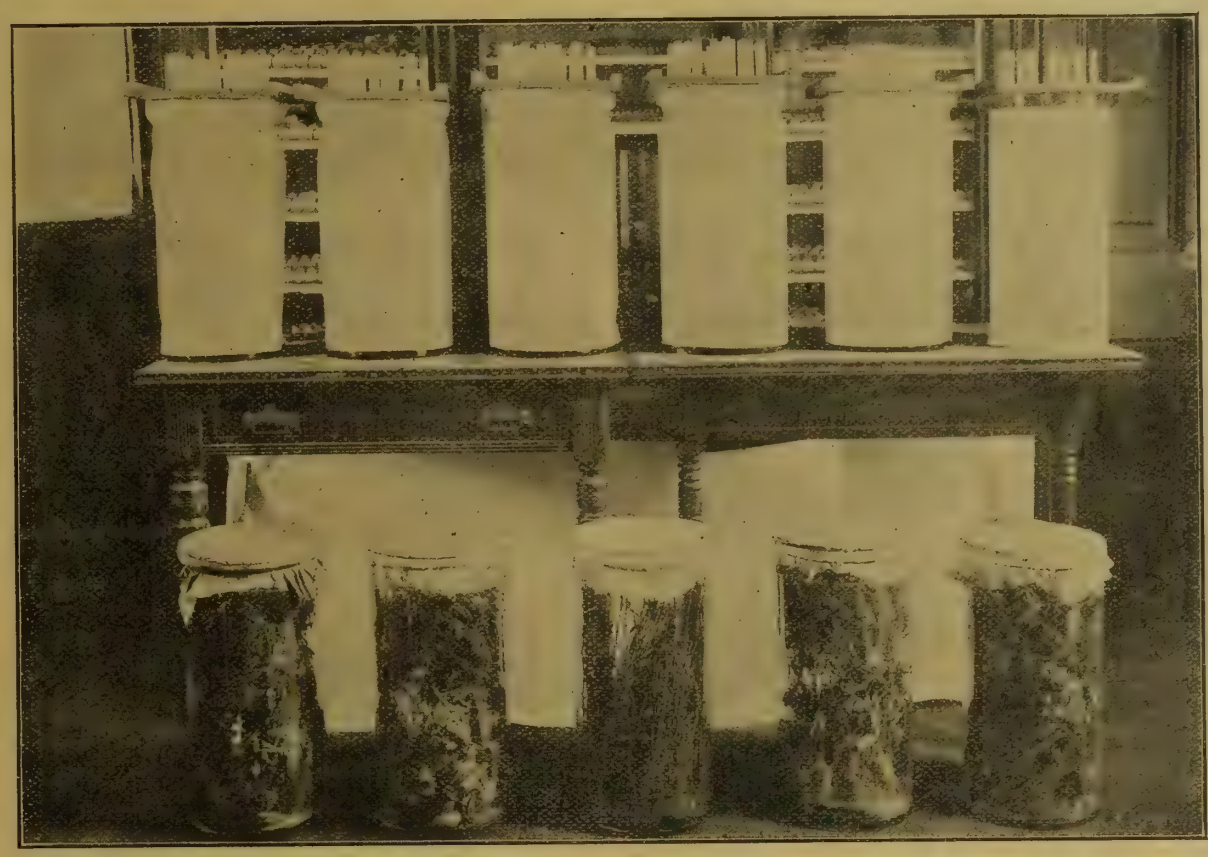
A Wonderful Insect ✂ It Promises Great Good

For some months there has been considerable talk in the papers regarding the South African insect, Scutellista cyanea, which is a parasite of the black scale. This insect is now proving itself of such vast economical value that a short article regarding its habits,its worth, and its history may be appreciated by the readers of the Cultivator.

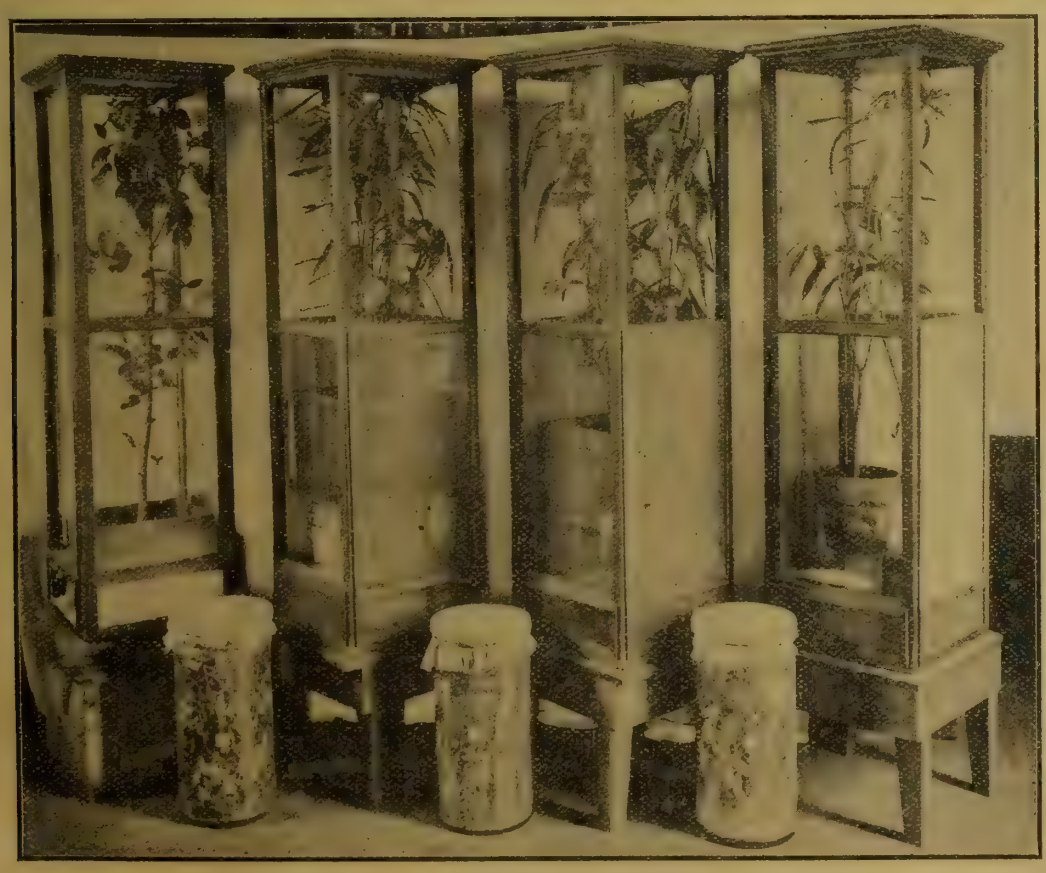
It was the pleasure of the writer to see the manner in which Alexander Craw, State Quarantine officer, handles the cages in which these insects and many other "pets" are kept and bred in his office in room 11, Ferry Building, San Francisco. Mr. Craw is thoroughly in love with these mites, and watches and attends to them in a way which has developed many wonderful results. The different forms of these cages and the jars and the manner of collecting insects for shipment are shown by cuts in this issue which are used through the courtesy of the State Board of Horticulture.

The first Scutellista which was received in this country was in 1898 through the efforts of L. O. Howard of the Department of Agriculture, and this was sent to Florida, but no results were ever obtained from it. Later Prof. Chas. T. Lounsbury, government entomologist of Cape Colony, called attention to this insect as an efficient enemy of the black scale. Several colonies were forwarded to San Jose, but no results were secured from them. In October 1901 Prof. Lounsbury wrote to Mr. Craw that he had started two boxes containing cuttings from oleander berry parasitized scale. From this shipment seventeen perfect insects were secured by Mr. Craw. Examination proved that only four of these were females, and when placed in breeding case, a small spider that was hidden in a curled-up leaf, seized and killed one of the females, leaving only three from which the millions who are now in the State have sprung.



Insect-Breeding Jars in the Office of State Quarantine Officer Craw at San Francisco, Showing Method of Breeding and Capturing Beneficial Insects for Shipment.

The insects are bred in the jars, as shown in the lower part of the illustration. In order to capture them the jars are darkened, as shown in the jars on the table. A board cover is placed over each jar and this is filled with half-inch holes. Into each of these holes a small vial is tightly fitted, mouth opening downward into the jar. The insects work up to the light, and when a colony has entered a vial, it is replaced by another, and the captured colony packed for shipment.



Breeding Cases for Beneficial Insects in Mr. Craw's Office.

The plants are shipped in from some section which is infested with scale. They are enclosed in glass and gauze, and the parasite released to prey upon the scale and to breed.

Regarding the first breeding of the insects Mr. Craw says: "On December 26, 1901, I examined a full-grown black scale from a tree in the breeding case, and found a small maggot of the Scutellista cyanea, about twice the size of the black scale egg. This convinced me that they were breeding, so no further examination was made. On February 7, 1902, the parasites began to issue from the scales. During the warm summer months we find that the Scutellista pases through all its metamorphoses in forty-seven days."

From these three insects colonies have been sent out to every county in the State where the black scale is troublesome. The manner of collecting in the little vials is illustrated in one of the illustrations. These vials are then inclosed in a wooden container and may be mailed to any part of the country. Mr. Craw recently visited Southern California to determine as to whether the shipments which had been made to Southern California have proved successful. He found them in every county not only living, but almost invariably spreading at a remarkably rapid rate.

Possibly the most pronounced results have been secured near the coast, yet it has been proved at Riverside, and other farther in valleys that the parasite will live wherever the scale does.

8500 THIS WEEK.

The Cultivator is still growing! This issue we print 8500 copies which go to regular subscribers. The 10,000 mark is getting nearer and by January 1st we will have that number of subscribers.

Watch us grow.

PROF. A. J. McCLATCHIE.

The Cultivator takes pleasure in announcing that it has arranged to add another writer to its staff, which is none other than Prof. A. J. McClatchie, for the past few years connected with the Arizona Experiment Station. Prof. McClatchie has a reputation which is world-wide as an authority on eucalypts, and is an all-around agriculturist and horticulturist of practical experience and deep study. He has served for several years on the staff of the State University of Arizona, and will add in many ways to the worth of the Cultivator, which we hope to increase constantly during the coming year. Prof. McClatchie will write upon eucalypts, upon general topics of horticulture, but he is a specialist in bacteriology, having had several years experience in the scientific handling of milk in California.

His writing of regular articles, however, we do not think will add as much worth to the paper as his ability to answer questions. This feature is becoming one of the strongest and best in the Cultivator. Send in your questions.

The former firm of Porter Bros. is now known as a corporation with the name "Porter Bros. in Liquidation." Trustees of this company have given a bond for $50,000 to cover the value of the local merchandise held by the fruit company. This corporation is composed of the largest creditors, mostly bankers. The liabilities are placed at $1,500,000, and the assets at $1,000,000. This corporation is a new idea in the handling of insolvent estates, and its working will be watched with some interest.

A BREAK IN CO-OPERATION.

Some little concern has been manifested by believers in co-operation by the break-away of the San Bernardino County Fruit Exchange from the California Fruit Agency. The Cultivator has not been informed from the San Bernardino side of their reason for this move, which appears on the surface to possibly endanger the best interests of the citrus industry of California. This disaffection however, is said to be largely in that particular section eminating largely from Redlands, which has always been more or less opposed to the co-operative principles which have been followed by the exchange. We give below a few words which were authorized by President Naftger of the agency, and hope next week to give further particulars.

Briefly stated, the circumstances leading up to the action of the San Bernardino County Fruit Exchange in withdrawing from the Southern California Fruit Exchange are these:

The contract entered into between the Southern California Fruit Exchange and the California Fruit Agency provided for the marketing through the Agency of all the fruit owned and controlled by all parties, who were members of the various Exchanges and associations on April 1st, and also that the Exchange would not open its doors to take in new members. This agreement was not objected to by the representative from San Bernardino County, on the Board of Directors of the Southern California Fruit Exchange, nor by any other parties.

After April 1st an attempt was made to organize the Exchange Association in Redlands, and a demand was made that the Agency should market the fruit, which demand was refused, because it was not consistent with the agreement. No claim has been made or is now made that the San Bernardino County Fruit Exchange had any membership or any fruit under its control in Redlands at the time the agreement was made. If the privilege had been granted to the San Bernardino County Fruit Exchange to have a new association organized in Redlands after April 1st, every other exchange would have been entitled to the same privilege, and the agreement of course would be violated, and the organization go to pieces.

The San Bernardino County Fruit Exchange has shipped during the season now closing, 650 carloads of fruit, of which about 500 cars were packed by the associations which we understand have voted to withdraw. Meantime, the agency, through the Citrus Union, has acquired several thousand carloads of fruit in San Bernardino county. The Southern California Fruit Exchange, and the Agency could not accede to the demands made by the San Bernardino County Fruit Exchange without doing an injustice to other parties, and since the whole co-operative movement is based upon fairness and equal rights to all, their demand must necessarily be refused.

This is in very brief terms, the whole situation.

It is by no means probable that the Southern California Fruit Exchange will be without membership or fruit in San Bernardino county.

Gen. Jno. C. Black, of Illinois, was elected commander-in-chief of the G. A. R. at San Francisco last week.

EDITORIAL NOTES.

Secretary of War Root has tendered his resignation to President Roosevelt, to take effect about the first of January. Secretary Root will be succeeded by Judge Taft, now governor general of the Philippines, who will resign from that position to come to Washington to take up his new duties. He in turn will be succeeded by Gen. Luke Wright of Memphis, Tenn., now serving on the Philippine commission. It is understood that these changes are all agreeable to the administration, save the regret in losing Secretary Root who has always been in closest relation with the President.

* * *

The government has taken a great step toward irrigation of the desert in Southern California by filing upon all the unappropriated water of the Colorado river, a few miles above Yuma. The water for appropriation is claimed to be 4,000,000 miner's inches under six-inch pressure. It is said the water is to be restrained by means of a dam which will be located in California and Arizona, and will restrain a vast body of water. In addition there have been withdrawn from entry some thirty-six townships, all in connection with the same irrigation move.

* * *

Yankee ingenuity seems to be a winner again in the construction of fast sailing vessels. The first race between the Reliance and the Shamrock was a failure because of the wind preventing a finish in the time limit.

The next race on Saturday showed the Reliance a winner with more than 1¼ miles to spare. The best average ever made by this yacht was in this race and was six minutes and eight seconds. The second race on Tuesday last was won by the Reliance, but not by the strong lead which she had formerly. The third and probably the deciding race is too late for the Cultivator to give results this week.

* * *

It may be of interest to note the former races which have led up to this one. The cup was first won in English waters in 1851 by a small 170-ton two-masted schooner. The name of this schooner was the America, and this cup has been known as the America's cup since that day. The cup was given in 1857 to the New York Yacht Club conditional on its being a trophy which might be won by a challenging yacht from any foreign country between 30 and 300 tons burden. The challenges have been as follows: In 1870 the Cambria was beaten by nine American schooners, the Magic leading; 1871 the Livonia was beaten by the Columbia and Sappho; 1876 the Canadian vessel, Countess of Dufferin was defeated by the Madeline; 1881 the Canadian vessel Atlanta was defeated by the Puritan; 1885 the Genesta was defeated by the Mayflower; 1886 the English Galatea was defeated by the Mayflower; 1887 the Scotch boat Thistle was defeated by the Volunteer; in 1893 Lord Dunraven's Valkyrie was defeated by the Vigilant; Valkyrie II challenged again in 1894, but the vessel was lost in a storm; 1895 Lord Dunraven's challenge with the Valkyrie III was defeated by the Defender; 1897 Sir Thomas Lipton's Shamrock I was defeated by the Columbia; 1901 the Shamrock II was again defeated by the Columbia.

A canal forty feet wide is to be constructed for Colusa county.

TRULY REMARKABLE.

Geo. H. Croley, the poultry supply man, of 508 Sacramento St., San Francisco, writes us as follows:

SAN FRANCISCO, AUG. 20, 1903.

CALIFORNIA CULTIVATOR, Los Angeles, Cal.

Dear Sirs: Enclosed please find change of copy for my adv. to appear in all September issues and begin Aug. 28th. This is to occupy the same space as adv. now running, (the $4 special offer ordered for July and Aug).

By the way! It may interest you to know that the result of this adv. in your paper has been **truly remarkable.** Yours truly,

GEO. H. CROLEY.

Advertisers in the CULTIVATOR now talk to 8,500 subscribers **every week**; that's why they get results.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

A SMALL TEMPEST

The defection of a few associations in San Bernardino county, some of which were associations only by promise between the alleged members made by word of mouth, should not for a moment bother those who believe that co-operation is the key to success in any undertaking at this age of the world. It is needless to argue the case with the few men who have set their judgement against that of the multitude of strong, progressive fruit growers. If present circumstances, and the experience of years in which the association ideas, did not prevail do not appeal to the malcontents at Colton and Redlands, advice nor admonition would have any weight with them. They have done their little stunt at disorganization and if the commission man gets them within a year there will be but little sympathy extended by those who faithfully hold on to the only means of salvation—the principles of general co-operation.

It has long since been settled that the chief vantage point of co-operative fruit marketing is in the selling agency. We have set forth time and again the fact that oranges and lemons may be prepared for shipment under direction of the grower, whether he does the work with his own force or through association with his neighbors. And there is not much difference in the cost of packing the fruit by the individual or by the association, perhaps a few cents per box always in favor in the association. But in the sale of fruit through a commision broker as against its sale through the growers' own agency there is often the difference between total failure and success. With the commission dealer it is the question of a few dollars on a car, made as quickly as he can call the turn on the trade and at rates the broker is not particularly interested in. He has been known a few thousand times to have stood in with the trade with a total disregard to the interest of the fruit grower. He it there and so is the fruit but the producer is in California thousands of miles away and no one to protect him from the dishonesty of the average commission man. Do we look for the orchardists to allow their only safeguard to lapse and bring about a resumption of the reign of the lawless commission system?

No doubt the commission sharks of the east rejoice at even the promise of a defection in the ranks of either the Citrus Union or the Exchange. One of the most active bidders for the privelege of slaughtering the interests of malcontents was a candidate for appointment as agent for the California Fruit Agency. He now wants to pick off the strays and get them into a commission deal. One of these prospective commission men in the orange business owes a member of the Citrus Union a large sum of money and this season is trying to get all the business he can from his long-standing creditor.

The rank and file of the co-operative growers are not disturbed by the attempted inroads of the old gang of commission men. Experience with it in former years has not been forgotten, and however plausible its promises the dark days of the early nineties will loom up as a cloud upon the ardor of the disaffected. In those days the fruit was not of poor keeping quality. Misfortune like that of last winter had not "touched" the crop, nor were there many carloads to market. But the commission men made a sad botch of selling the crop. What would they do with 30,000 cars? There would not be one carload sold at profitable prices. The old ship is safe and sound. Stay with it.

The gathering together of an exhibit of California's products at the World's Fair has proceeded far enough to show that there will be an exceedingly fine exhibit which will be a credit to the State.

TWO MINUTES.

For many years the prediction has been made that the horse would yet trot a mile in two minutes. It has been done.

Lou Dillon, a California horse owned in Santa Rosa, made the Easterners go wild Monday on the track at Readville, Mass., by trotting her mile in two minutes flat. Some time ago Dan Patch paced his mile in one minute and fifty-nine seconds, but the trotter has heretofore never been below 2:02¼, which was held by Cresceus, made at Columbus, O. The record breaking from 1818, when Boston Blue made the mile in three minutes is as follows: 1818, Boston Blue, 3:00; 1824, Albany Pony, 2:40; 1834, Edwin Forrest, 2:31½; 1835, Oneida Chief, 2:31; 1839, Dutchman, 2:28; 1845, James K. Polk, 2:27; 1849, Lady Suffolk, 2:26; 1853, Highland Maid, 2:27; 1853, Tacony, 2:25½; 1856 Flora Temple, 2:24½; 1859, Flora Temple, 2:19¾; 1865 Dexter, 2:18¼; 1866, Dexter, 2:18; 1867, Dexter, 2:17¼; 1871, Goldcmith Maid, 2:17; 1872, Goldsmith Maid, 2:16¾; 1874, Goldsmith Maid, 2:14; 1878, Rarus, 2:13¼; 1879, St. Julien, 2:12¾; 1880 Maud S, 2:10¾; 1881, Maud S, 2:10¼; 1884, Maud S, 2:09¾; 1885, Maud S, 2:08¾; 1891, Sunol, 2:08¼; 1892, Nancy Hanks, 2:04; 1894, Alix, 2:03¾; 1900, The Abbott, 2:03¼; 1901, Cresceus, 2:02¼; 1903, Lou Dillon, 2:00.

GENERAL NOTES.

Immense storms have done vast damage to grain fields and to the vineyards of France.

Five car loads of farm machinery were shipped last week from San Francisco to South Africa.

Council Bluffs, Ia., was visited by a storm which did vast damage to buildings in the city and crops about it.

One of the finest fruit packing houses in the State is about completed at Pajaro. It is 200 feet long by 60 wide and is owned by the Simpson-Hack Fruit Company.

C. H. Diamond, a New York expert poultry raiser, is so impressed with California that he will buy 150 or more acres of land in Sonoma county and raise fowls on a large scale.

Damp weather is doing great damage to the hop crop in Oregon. Vermin have infested the yards, and now the damp weather is causing the appearance of mould. A few days of sunshine are needed to correct the conditions existing.

The Agricultural College of Guelph, Canada, has for six years experimented on the relative value of planting small and large seeds. It has been demonstrated that the yield from large plump seed is greater than from small seed.

A great co-operative department store association has been incorporated in New Jersey. It will issue stock and be capitalized for several millions. It is the intention to establish mammoth department stores from Maine to California, and in all the large cities in the United States.

The Sutter county Almond Growers' Association sold at auction 120 tons of almonds on last Monday at the following prices: I. X. L., 10c per pound; Nonpariel, 10½c; Ne Plus Ultra, 9½c; Drake's Seedling, 8½c; Languedoc, 8¼c; Golden State, 8c; Peerless, 9c; Llewellan, 8¼c; Routier, soft 8c; Commercial 8c; La Prima 9c; Mixed 6c.

The grape growers and wine makers' State Convention, held at St. Helena August 15th, was attended by about 200 delegates. Congressman Bell and others addressed the meeting and resolutions were passed asking the passage of laws by Congress protecting their interests and prohibiting the adulteration of wine. A. Sbarbaro of San Francisco was elected president and B. Bruch of St. Helena secretary.

This country manufactures but little tartaric acid. It is made from grapes. It is a profitable industry heretofore neglected in the United States. A. Sbarbaro, chairman of the California Promotion Committee, has offered a prize of $25,000 to the individual who can produce a successful method for manufacturing cream of tartar from the California grape. Now, that useful article is almost exclusively manufactured in Europe.

Coast News and Notes

By R. A. Dague, 1130 Eddy St., San Francisco

A co-operative creamery has been established by farmers at Tulare.

The prune crop of Oregon will be very large this year. It is estimated at 45,000,000 pounds.

The orphan boys from the San Anselmo Orphans' Home were sent out this season into the country to pick prunes.

The Pleasant Valley Creamery is prosperous. It has 200 cows of its own and buys large quantities of milk from farmers.

The coming race meet of the Pacific Coast Trotting Horse Breeders' Association will be held at Petaluma on August 26 to 29 inclusive.

There is an epidemic of typhoid fever in and near Keswick. It has been traced to the milk from cows that drink water that was contaminated by a sewer.

A movement is well under way to establish goat ranches in Texas and California. The animals will be raised for their skins, which will be manufactured into shoes.

The Pomona Fruit Growers' Association has completed its season's work in apricot curing at the yards. The association has dried 200 tons of fresh fruit this season.

In Napa county farmers kill ground squirrels by feeding them raisins with a few grains of strychnine inserted in the pulp. They also use green almonds and strychnine.

The State Board of Trade exhibit was visited by many G. A. R. veterans who expressed themselves as astonished at the magnificent specimens of California fruit on exhibition.

In Norway, the school children, during the summer, are employed by the government in planting young trees. It is estimated that 9,500,000 spruce and pine were planted this year.

The hop fields of Pleasanton, Alameda county are the most extensive in the world. The yield promises to be the heaviest in many years. The picking season will commence about August 31.

Ninety-six per cent. of California farms are operated by their owners, 75 per cent. of whom are white. California has a larger per cent. of unincumbered homes than any New England State.

An organization has been completed at Hanford, to be known as the California Condensed Milk Company. The business of the company will be as indicated by its name. The capital stock is $25,000.

Until it was drained, 12,000 acres of land near Redding was a worthless swamp. Now 2500 cattle are doing splendidly on that land. The land was reclaimed by a canal 16 to 24 feet wide and two miles in length.

The Merritt-Fisher Company of Santa Rosa are putting in $5000 worth of new machinery in their fruit packing house and are adding another story. The company expects to handle more fruit this than any former year.

Last spring twenty-five or thirty State University students engaged to go as cooks and waiters on steamers going to Manila. They are now returning. The captain of the transport Logan praises highly those who went and returned on his ship.

The experimental poultry station recently established at Petaluma, by authority of a Stae law has opened for business. In preparation for the work Dr. Ward and Prof. V. A. Moore have for the past month been investigating the various diseases that afflict chickens.

Discussion in this State still continues over the danger to California from Porto Rico oranges. It costs 90 cents a box to put California oranges in the New York market and bu. 20 cents from Porto Rico. Many Americans are going to the island to raise oranges.

The Kern County Supervisors have appointed four deputy sheep inspectors as provided by a late State law.

At this writing the total shipments of fruit from California has been 3761 cars, as against 3724 on a corresponding date last year.

Mr. Olney, mayor of Oakland, urges that city to put in its own water plant, which he estimates can be done at a cost of three-quarter million dollars.

The late statement of Professor E. H. Twight to the effect that the stock of wine grapes this year would not be up to the average was contradicted by some parties, but the Professor insists that his report is correct.

Butte county is coming to the front with the claim of being adapted to the raising of citrus and deciduous fruits equal to any other locality. It claims its oranges ripen two months earlier than in Southern California.

The Sacramento Valley Land Company has arranged to put on the market many thousands of acres of land in forty acre tracts at about $40 per acre and supply water for irrigation at $1.00 per acre per year.

At a late convention of fruit growers, held at San Jose, Manager F. W. Crandall of the Sorosis Fruit Packing Company, stated that while in Germany he saw many boxes of California apricots opened in Hamburg, which were wet and full of sulphur fumes.

There will be 400 delegates to the National Irrigation Convention, to be held at Ogden from September 15 to the 18th. About thirty delegates will be there from California. There will be as an incidental feature a fine exhibit of fruits and grain. Prizes from $500 down to $10 will be awarded for the best exhibits.

There is to be a decided change in the curriculum of the College of Agriculture of this State. The change is from the theoretical to the practical. There will be "Care and Management of Live Stock," "Plowing," "Sheep Shearing," "Operating a Dairy," etc. The new curriculum will be patterned after that of the University of Wisconsin.

The secretary of the Interior has approved the award of contract for the construction of an irrigating canal to connect the Truckee and Carson rivers to Chas. A. Warren & Co., of San Francisco, at an aggregate cost of $942,437. The canal will be thirty miles in length and will reclaim about 300,000 acres of arid land.

G. A. R. NOTES.

It is estimated that more than 20,000 veterans and an equal number of their eastern friends attended the National encampment last week.

The Sacramento Valley Veterans' Brigade, whose headquarters were at the Lick House, gave away during the encampment nine car loads of fruit and wine.

During the week representatives of the counties of Shasta, Tehama, Colusa, Yuba, Yolo, Sutter and Butte, made presents to eastern visitors of 12,000 small bottles of wine and mineral water, 16,000 baskets of peaches, 16,000 pears, 8000 packages of nuts and many hundreds of baskets of assorted fruits.

From three to six car loads of fruit and wine were distributed free to the veterans and their friends every day last week.

Alameda county fed 10,000 veterans and their friends at Oakland August 21, that being Alameda county day.

The encampment was a great success in every way and the eastern people are loud in their praise of the royal treatment they received.

During the Civil War 325,263 soldiers were killed or died from wounds or disease from 1861 to 1865.

Long Beach is planning to erect a new pleasure pier.

Apples have begun to leave Watsonville in carload lots.

The explosion of a gasoline stove at Biggs caused a $50,000 fire.

The Griffin-Shelly Company will erect a large packing house at Gridley.

The annual meeting of the State Grange will be held in San Jose, Oct. 6 to 10.

The Exeter Sun claims that Tulare county will lead all orange districts of California.

Exeter has a pump which is lifting 75 miner's inches of water to an elevation of 255 feet.

The salmon run of the Columbia River is over, and the cannerymen are taking in their seines.

The present estimate is 550 car loads of walnuts from Southern California for this season.

The shipments of green diciduous fruits from Vacaville at present amount to 554 carloads.

Watsonville is now shipping about 100 chests of blackberries, and 25 to 30 of strawberries daily.

The newspaper men have been invited to an excursion to Imperial on the third of October.

Four hundred steers were driven from Covina to the Alameda sugar factory last week for fattening.

The Chino Sugar Factory is slicing 700 to 800 tons of beets daily. The beets average 17 to 18 per cent. sugar.

San Diego county supervisors anticipate the construction of an automobile road from San Diego to Imperial.

The standard Newton pippins are commanding $1.00 a box in the Pajaro valley. Most of the crop has been sold.

The Corning Roachdale Company is arranging to handle the dried fruit of the members of that co-operative association.

The Board of Supervisors of San Bernardino county are looking for a route for a free road up the Cold Water canyon.

Riverside is making an effort to secure the Salt Lake railroad shops, which it is claimed will disburse $50,000 per week.

A rough estimate of hops of the Sacramento Valley is 1,000,000 pounds. They are worth about twenty cents per pound.

Some of the low lands near Yuba City, Sutter county, along the Feather River are being protected by the construction of new levees.

The estimated damage created by squirrels in Lompoc and Santa Rita is $50,000. The county is supplying the farmers with poison.

The little town of Hollywood is sadly torn up over the proposed change of the name of Prospect avenue to De Longpre avenue.

The Santa Ana Dried Fruit Association have been offiered seven cents for its 115 tons of dried 'cots. They are holding for higher prices.

The Sutter County Development Association has established permanent headquarters for advertising the merits of that county in Sacramento.

Mendocino county pays a bounty of $6 for coyote scalps. To this the sheepmen have added $20, which makes a total of $26 bounty for each coyote killed.

The San Gabriel Forest Reserve is supplied with an extensive telephone system which allows immediate communication with the main office in case of fires.

Bee Inspector Pleasants of Orange county reports foul brood as far less in evidence than anticipated. Beekeepers are supporting all efforts to rid California of that disease.

The California Raisin Association have issued a statement in which it affirms that it will return all contracts and close its offices on September 1st, unless the shortage of several thousand acres of vineyards are signed up with the association by that time.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so faras possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.
Continued.

In our last article we gave a general account of the Neuroptera or lace-wings. We noticed their lace-like wings, their typical mouth parts and the fact that they differed in their transformations, the lower section of group having incomplete metamorphoses. We also noted that with the exception of white ants, all preyed upon other insects and so may be regarded as our friends. In the present article, it is my purpose to consider more fully the families in this section of the Neuroptera. I shall treat the order as did Linnaeus, remarking however that most all entomologists of today separate the order into several orders, and probably with good reason. But as entomologists are as yet not in full accord as to these separations, I will hold to the arrangement of the great Swedish naturalist. Indeed, for the practical man this has its signal advantage as in nearly all our entomology the old scheme prevails.

* * * *

Bristle Tails, Spring Tails, etc.—There is a group of insects, representatives of which are not uncommon here in California, which have a caudal appendage which many of them can bend under their bodies and which can serve them as a sort of spring pole whereby they can leap for long distances. These insects never have wings, and show by their simple thorax that they never have had. These insects are probably very like the old-time insects from which most of our present species were evolved. They are found in cellars, under stones, etc. Some of them are covered with sort of scales upon which are closely set and very minute markings. Thus these scales are used with great satisfaction to test the high powers of microscopes. Sometimes the bristle-like appendages at the tip of the body are abbreviated and resemble the forceps as seen in earwigs. Others have rudimentary abdominal legs reminding us of the larvae of butterflies and moths, which is another reason for believing that they typify the old early type of insects.

Some entomologists classify these simple insects under the order Thysanura, which word means tassel-tails. There is little doubt that they are a distinct order.

* * * *

May Flies—The May-flies are easily told by their small hind wings, short atennae, and long caudal appendages. The larvae exist in water and breathe through gills, which fringe the sides of the abdomen. These are not common in California as the water is too scarce. In Michigan I have seen the streams and pools full of the larvae and have known the street lamps in Detroit and Toledo to be so enveloped by the flies that they were almost invisible. As the imago crawls from the water it casts its last skin which seems a duplicate of itself, so as it crawls forth one would think there were two insects side by side. The imago, or mature insects live scarce more than a day, and hence the name of the family, Ephemeridae. Comstock makes a separate order of these May-flies which he calls Ephimerida. These have no special importance except in the economy of nature, they help preserve the beautiful balance. They undoubtedly form a large part of the food of fish.

Dragon Flies—In the last Cultivator I spoke so fully of the dragon flies, or darning-needles, that little more need be said. They are exceedingly interesting from their beauty and value. A perfect collection of dragon flies ranks perhaps highest in beauty. Yet as elsewhere the best are costly. It is very difficult to have a complete collection of these magnificent insects. The abdomen and legs are very likely to drop from the insect. This family, Libelulidae, are so well known that little more need be said of them. They are, however, peculiar in their very large eyes and very short atennae. I have already referred to their curious labium in the nymph state. They are also remarkable for the breathing apparatus of the nymphs. Their gills are in the rectum and they draw the water through the anus or vent to bathe these organs. Upon occasion they force this water out very rapidly, which propels the insect rapidly forward. In this respect they remind us of the squid or cuttle fish. As stated before, these insects are, as nymphs, the terrors of pond or pool and when mature, of the air as well. There are few insects that are more ferocious and more to be encouraged as predacious species. The fact that they are free to attack and destroy the bee is high testimony o their courage. Many entomologists make a separate order of these. Comstock calls the order Odonata.

* * *

Stoneflies—The stoneflies—family Perlidae—though not common in California are very common in the East or in any section where fresh water pools abound. The nymphs, by which term we refer to both larvae and pupae of insects with incomplete transformations, remind us of the same in the dayflies or Mayflies. The mature insects have quite long antennae and very large hind wings. The network of the wings is very obvious. The the larvae of the stone flies are often used as fish bait.

White Ants—The Termitidae, or family of white ants, are very distinct from the family of true ants so familiar to us in path or by roadside; yet in appearance and habits they remind us strongly of the common ants. Here we have not only queen, male and worker, but a sort of large jawed, big-headed worker known as soldier. The queen lays all the eggs. She is sometimes of enormous size, her abdomen as large as one's thumb. She is enormously fecund. It is said that she will sometimes lay as many as one hundred thousand eggs a day. She is utterly helpless and is not only fed but cared for entirely by the workers. The males, like the same in bees and ants, have only the sex function. The soldiers protect the colony and not only show great valor but possess a savage bite. The workers, like the soldiers, are wingless and do all the work of the colony. Like the worker bees they are abortive females. Their home is underground or in tunnels bored by them in wood, and the population of a colony is sometimes tremendous. Of all Neuroptera, these alone are injurious. I have known them in Michigan to seriously injure greenhouse plants. I have found them at Claremont, boring extensively in trees. In South America and other tropical countries they often ruin furniture and even destroy buildings by cutting away all but the very outside, leaving only a thin shell. Humboldt said that in certain parts of the world a library would be impossible because of these white ants. I have seen a whole row of books that could be wired together by passing a wire through a tunnel formed by these termites. I have often known these white ants in the Northern United States to tunnel in the floors or beneath the floors of houses. Like the true ants, they mate on the wing. Thus it is not uncommon to see a great swarm of these white ants, as they come forth at the mating season. After mating the male dies, while the queen sheds her wings and becomes the mistress of a new kingdom, whose inhabitants may be numbered by the millions.

* * * *

Booklice—The booklice comprise the family Psociadae. They are quite common in our orange trees. Many of them are wingless. They are light colored and look not unlike lice. Their broad head and long attennae however, quickly reveal their true position. These, too, have biting mouth organs and do not suck as do the true lice. They are quick of movement and run rapidly over twig and leaf. As these psocids lay their egs they cover them with a silken thread and thus suggest the spider habit. Like others of the order they are predacious and so no harm need to be feared from their presence in the orchard.

* * *

GOOD CULTURE.

I referred in the last Cultivator to the importance of better culture in many of our citrus orchards. I believe Southern California stands at the head of all sections of the country in this respect. Yet how often variagated leaf and die-back show that even here we are not entirely beyond criticism in this matter of good tilth. There are two examples of magnificent cultivation in the La Habra valley, which can but rejoice the heart of every passerby. I refer to the two splendid orchards of Messrs. Roach and Leffingwell. These gentlemen are not budding their lemons over to oranges. They cultivate in the best fashion and their profits show their wisdom. I was glad to notice not only the deep culture but also of deep irrigation by sub-furrowing. How long will it take for our orchardists to learn, especially in case they have rather heavy soils, with a tendency to the formation of hard pan, that the only right, wise way is to use very deep furows in irrigating. Mr. Roach is only recently here, yet he shows rare wisdom in frequent visits to such men as Chapman and Leffingwell and his orchard shows that he is already among the masters.

* * * *

THE NATIONAL BEE ASSOCIATION.

It was thought by many a matter of doubtful wisdom, the inviting of the National Bee Association to meet in Los Angeles. Results proved that it was indeed very wise. The attendance was second only to the great Chicago meeting at the time of the exposition.

* * *

The two subjects that excited most interest were those of co-operative marketing and foul brood. The California Honey Exchange is ably officered and has already won a most gratifying success. It has already secured to its members much cheaper supplies and more excellent packing and grading. It will also secure a much larger price for honey the present season. Mr. Mercer's great crop of honey the present very poor year, of more than fifty tons and Mr. McIntyre's more than forty tons show very conclusively that California stands well in the lead as a honey-producing State. Mr. Mercer is surely enjoying the fruits of his success, as shown in his $1200 automobile and a further bank account of some four or five thousand as a result of the year's harvest.

* * *

The writer was gratified at the obvious tendency of the large audience to treat resolutely the foul brood pest. There was no disposition to tolerate the use of combs above a foul brood chamber. There was likewise wise objection to any attempt at pruning out foul brood cells and saving adjacent comb. We must all remember that all bacteria are insidious foes and that any thing like temporizing or half-way measures is never to be considered in any warfare with these virulent destroyers. We now have a very excellent foul brood law and for the most part, at least, very excellent inspectors. Let us give them our entire support and co-operation in their effort to eradicate the blighting bee malady from among us.

* * *

It was no mean compliment to California that the very important office of secretary for the ensuing year was bestowed upon our greatly respected Mr. Brodbeck. The next year will certainly be a very important one in the affairs of the association, as the annual meeting will be held in St. Louis. Mr. Brodbeck, as president and manager of our exchange will also do much to spread this form of co-operation throughout the country.

A WONDERFUL INSECT.

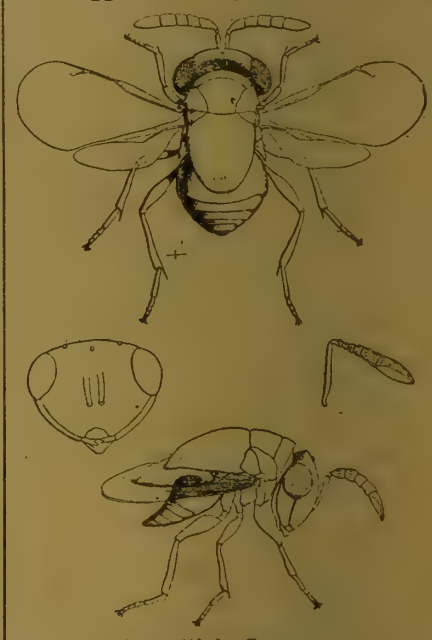
(Continued from first page)

It will require a couple of years for the few which may be released in any orchard to accomplish apparent results. The close observer will see promise of good work within a short time, but to increase in sufficient numbers to destroy the millions of the scale requires time.

Colonies of the Scutellista may be secured of Alexander Craw, room 11, Ferry Building, San Francisco. Also in Southern California, especially in Los Angeles county applications may be made to Horticultural Commissioner J. W. Jeffrey, Los Angeles, or to Inspector C. A. Day of Pasadena.

One of the closest observers of this pest is Inspector Day of Pasadena. He recently brought into the Cultivator office twigs of pepper trees, which were one mass of the scale, and under almost every scale could be found a very lively little white grub making a hearty meal of the eggs and the recently hatched scale. We asked Mr. Day to give in a few words the habits of the insect and some of his observations, which he did in the following words:

The scutellista cyanea are not true flies (Diptera,) but belong to the Hymenoptera order, along with ants, bees and wasps, under this order they come in with the family. The Chalcididae, nearly all members of which are parasitic on other insects, lay their eggs in the egg case or larvae



Ccutellisia Cyanea
The imported South African parasite of the black scale, greatly enlarged

of their victims, which hatch, and the young feed on the tissues of the host.

The Scutellista is a small black Chalcidid fly. The antennae of the male is black and of the female brown. The female lays from 150 to 200 eggs, the eggs are deposited under the shell of the nearly matured scale; from the egg the larvae of the insect hatches. The larvae, a white grub, feeds on the eggs and larvae of the black scale under which it is located. The larvae eventually passes into the pupa stage from which comes the fully developed fly. The time from egg to the full developed fly is between forty and fifty days. The adult fly does not eat the eggs or young scale, but feeds on honey dew. I have been indebted to Alexander Craw for information relating to the habits of this parasite of the black scale.

The larvae is round and white, and easily distinguished from that of the Rhizobius, which is flat and dark colored, but may be mistaken for the Tomesera Californica which it resembles. In examining scale for Scutellista we find many specimens of the larvae of the Rhizobius under the shells and occasionally one of the Tomesera, both of which are also parasites of the black scale.

There is usually found but one larvae of the Scutellista under a shell of the

scale. However, in rare instances, we find two of the pupa snugly stowed away in their temporary home.

The time of breeding for this parasite depends upon the condition of the scale. If we had matured scale, I see no reason why it should not work throughout the whole year. From my own observations this last year, I found larvae from March to November.

The introduction of this parasite is not always attended with success, the adult fly is very active and not easily caught, for the reason we are obliged to breed the fly especially for distribution. Or, we locate a colony by taking branches of trees upon which are black scale that have been parasited by the fly and place them in a tree of the orchard in which we wish to introduce them. We find the pepper tree best for this method of introduction on account of the large amount of scale on a single branch, it being possible to secure a good colony on the amount of wood we can put into an ordinary envelope for mailing.

GENERAL NOTES.

Owing to a scrap between the Georgia peach growers and the railroads, the rate on peaches has been advanced from 17 to 40 cents per hundred weight.

* * *

New York reports this as the greatest honey year in its history.

* * *

The cranberry growers of Wisconsin held their annual meeting August 18th, at the Gaynor-Blackstone Marsh.

* * *

The estimate of the grape output of the State of New York is 40 per cent of a full crop.

* * *

The New York State Fruit Growers' Association is being held at Niagara Falls this week.

* * *

The output of Florida oranges for the coming year is variously estimated at from 1,500,000 to 2,165,000 boxes.

* * *

The apple shippers convention at Niagara agreed upon an estimate of 48,614,000 barrels as the coming commercial crop for this season.

* * *

Sir Thomas Lipton has purchased a large tract of land in Georgia on which he will grow garden truck for shipment to England.

* * *

The apple crop of Canada is far below the average.

* * *

Capt. Chas. D. Sigsbee, formerly captain of the ill-fated Maine, has been appointed Rear Admiral of the navy.

"ITS PENNY WISE"

Policy to set out a good tree, costing good money, and then let the sun burn the bark, or the rabbits gnaw it, when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 450 Santa Fe avenue, Los Angeles.

CITRUS TREES

That will grow, bear profitable crops, and are true to name, are the only kind that we propagate. Thirteen years in the citrus nursery business — hence know the wants of citrus planters. Sumptuously illustrated catalogue on citrus culture *free;* send for a copy.

PEAR BLIGHT ON THE DECREASE.

Word from the upper San Joaquin valley, in which section the pear blight has manifested itself with especial virulence, has been received to the effect that it is not so bad this year as heretofore, and seems rather decreasing than increasing, and that there is some hope that it has run its course and will, if it does not disappear entirely, at least cease to be so great a pest as it has been for several years past. The pear blight is a bacterial disease, and one that is very difficult to handle as it is very insidious in its nature, working entirely in the sap wood of the tree and out of sight until it manifests itself in its most virulent form. It cannot be reached by external remedies and even severe cutting back will hardly check it. It may be that there are conditions climatic or otherwise, that are conducive to its spread and that these conditions may change and the disease stop, in other words it may have run its course. Whether this is so or not we cannot state, but from reports it would seem that the disease is not so bad as it has been, and it is to be heartily hoped that it has come to its stopping place.

* * * *

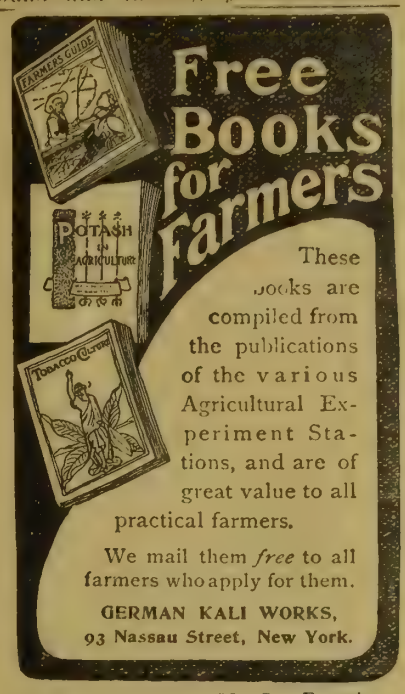
BETTER MARKETS FOR FRUIT.

It is encouraging to note that as the season advances the early promises of a good market are being fulfilled. While prices for fresh fruit have not been very high this season there has still been a fair margin for the growers and a few losses have been noted. There have been fewer red ink returns than usual this year, and growers in the Sacramento Valley state that both transportation and commission service have been much better than usual. The fresh fruit crop as a whole has not been up to a good average, but conditions have been so much better that the fruit grower will be better off at the end of the season than usual.

* * * *

SUCCESS OF THE SCUTELLISTA CYANEA

It is gratifying to note from the remarks of the papers in the south that the little South African parasite is making as good a record for itself there as it has done in the northern counties, where it first got a solid foothold. The writer has watched the progress of this little fellow from the time of its first importation from its native land, when in a package of seventeen live insects, Mr. Craw found but three living females. These were placed in breeding cases and supplied with abundant food and in a few weeks began to show their metal, for the three females had multiplied to dozens and colonies were planted in places convenient to San Francisco where their labors could be watched from the central office. In a few months these had so increased in the section where they had been established that it was difficult to find a black scale without its accompanying parasite and at the present writing it is very difficult to find black scale in large quanties in any section around the bay counties. Black scale can be found there, and always will be as it always will be in the south, but it no longer exists in such quantity as to be considered a serious pest. And here it may be well to caution our fruit growers not to expect too much from the Scutellista cyanea. It will never exterminate the black scale. When once a pest is established, we shall have it always, as we have now the cottony cushion scale and the San Jose scale, but both these have been so got under control by their natural enemies that they are no longer to be considered in the light of pests. Occasionally we hear of an outbreak of them in spots, and sometimes people express a fear that they are increasing and will be as bad as ever again, but the Vedalia, for the one and the Aphelinus for the other, soon overtake them and they are reduced below the danger line. So it will be with the Scutellista cyanea, even if it accomplishes all that we hope from it, we shall always have some black scale and sometimes we may have a good deal. But, from, present appearance there is no doubt that the natural enemy of the black scale has been found and thoroughly established.



Free Books for Farmers

These books are compiled from the publications of the various Agricultural Experiment Stations, and are of great value to all practical farmers.

We mail them *free* to all farmers who apply for them.

INSTITUTES.

The dates for Institutes for California as far as at present arranged to this date are as follows:

Goleta, August 28th and 29th.

Carpinteria, August 31st and September 1st.

Ventura, September 2nd and 3rd.

Fillmore, September 4th and 5th.

Fernando, September 7th.

Tropico, September 8th.

Bolsa, September 9th and 10th.

San Dimas, September 11th and 12th.

San Dimas Club Picnic, September 14th.

Upland, September 15th and 16th.

The rumor of war between Turkey and Bulgaria is thickening, and from the vast increase in the Turkish army which has been made in the last few weeks, it seems apparent that Turkey is preparing to wallop Bulgaria. Meantime the slaughter of men, women and children by both the Macedonians and the Turks continues.

THE WHOLE STORY.

"The Whole Story About Wood Pipe" is the title of a little pamphlet just issued by the National Wood Pipe Company of Los Angeles and San Francisco. This company was organized a few years ago in his city as the California Redwood Pipe Company. Its scope and the demand for its pipe which was proving so satisfactory, compelled the extension of the field, not only in Southern and

Connection of 24-inch continuous stave wood pipe with cast iron pipe through gate valve.

Northern California, but so that orders are now received from all sections of the West. On the enlarging of the concern and extension of the business the name of the corporation was changed to the National Wood Pipe Company.

Wood pipes have been in existence almost as long as men have had occasion to conduct water. The company has on exhibit at its office a section of a redwood pipe, which is nothing more nor less than a log with a hole bored through the center which has laid in the ground in Victoria, B. C. since 1862. This section was taken out of the ground in 1900 and looks as solid as if it were in the ground but a few months.

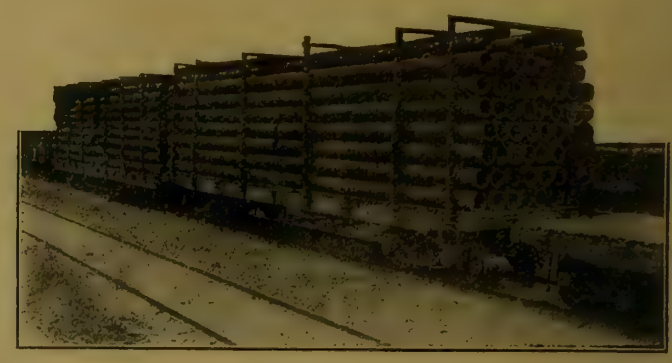
The great difficulty in the manufacturing of wood pipe has been to manufacture it economically and hold the staves together by some substance that is as durable as the wood. Good keeping wood, such as the redwood is under the ground, and constantly wet, is universally considered almost everlasting, but the bands with which the redwood pipe is held together will rust and does permit the pipes to fall to pieces. The difficulty of this manufacture was largely overcome by an invention of a machine by W. J. Woodward of this city by which the redwood pipe is bound together and at the same time is coated with asphaltum so as to make it impervious to moisture. The working of that machine is worthy of a trip to the factory to see how perfectly the wire is manipulated and drawn so tightly over the pipe, as to make each section almost invariably water tight.

This pipe is banded in lengths of 10 to 20 feet. The ends are sawed off square, and turned down to a slight taper. The joints are connected with cast iron collars the thickness of cast iron pipe. These collars taper from both ends to the center, to correspond to the taper of the pipe, but are made one-eighth inch smaller, to allow for compression in driving, which is done with a heavy maul, or sledge hammer, and driving block. In this way a joint can be made that will stand 200 pounds pressure per square inch, even before swelling, and that will never give further trouble.

The pipe is banded so as to carry a pressure of from 20 to 300 feet. The bands are spaced from 1½ to 4½ inches, depending upon the pressure and size of the pipe.

The pipe is especially adapted to orchard irrigation, is the most cheaply laid of any pipe known, and has great carrying capacity and is decidedly economical.

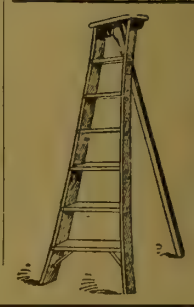
The little primer which the company issues will furnish far more information regarding this pipe than this paper can give, and it is well worth making application for by any one who is interested in conducting water. We give on this page a couple of illustrations, one showing the pipe loaded on a car giving something of an idea of its construction, and the other showing the manner of laying under engineering difficulties.



Machine Banded Pipe, 6, 8 and 10-inch.

NAMES OF FARMERS WANTED.

We want every farmer to read "THE PACIFIC TREE AND VINE," one of the best journals on horticulture, poultry, dairying and home-making published in the West. Twenty-first year. Thirty-two large pages. Subscription 50 cents. Send us five names and addresses and 10 cents for a six months' trial subscription to 918 I street, San Francisco, Cal.



Pomona Ladder Co's.

"TRIPOD"

An ideal Fruit Pickers' Ladder: For Lightness, Ease of Handling and possibility of getting right into the tree, by throwing the single leg over limbs. Every step double bolted. Sizes 6 to 12 feet. Circulars free.

DECIDUOUS FRUITS

By J. W. MILLS, Ontario, Cal.

INDIAN CORN AND LIMA BEANS

Editor Cultivator:—Which is the best variety of Indian corn to plant? Which is the best time to plant in cold districts? What is the average yield in bushels per acre from damp land? Would it be profitable to plant on good stony mesa land and irrigate?

What is the best time to plant lima beans in a cold district like this? Is the "small white bca " or the "red bean" a profitable crop compared with the lima? What is the avcrage yield per acre of each variety Are beans subject to any disease in this valley? Would beans do well on good stony mesa land here, without irrigation? —P. and H., San Gabriel.

The best varieties of corn for grain crops are white and yellow Dent. There are several types of these varieties. The flint corns are also extensively grown, but the former are more generally grown in the corn district of southern California.

It is not advisable to plant before the middle of May and if the weather continues cold and chilly at that time, better wait till the first of June. The yield will run from 25 to 50 bushels per acre, exceptionally good crops may go to 60 bushels. Judging from corn crops that we have seen growing on stony mesa land between Los Angeles and Santa Monica, we would think that corn would do well on your mesa land with irrigation.

Lima beans are like corn as regards moisture and temperature. They should not be planted before the first of May and if the season is backward, two weeks latter may be better. The small "white bean" will make a crop when the lima will sometimes get burned by the sun, though the lima is the most profitable to raise where the climatic conditions are right. We would not expect to make a success of raising lima beans in the San Gabriel valley unless we had a remarkably cool, damp summer to help us out. In the event of a spring that was as wet as the last, land which is well tilled after each rain and until planting time, should produce good white or red beans without irrigation, provided the subsoil retains the moisture well. The average yield per acre in bushels is about 35. That means a good crop in sections where beans are raised for shipment. Beans are not subject to any serious diseases in your section that we know of. The lima bean is very subject to the ravages of a worm that destroys the beans in the pods when green. This injury, however, seems to be confined to small garden patches. Growers of lima beans along the coast do not complain of this pest.

* * *

SCUTELLISTA CYANEA.

Editor Cultivator:—Can you send me or tell me where I can get a few Scutellista Cyanea for destroying the black scale? I have an orange orchard and the black scale is very troublesome. I read in your paper that they were doing good work.—Subscriber, Nestor.

We have none of the insects, but you can secure them no doubt, from Mr. J. W. Jeffrey, Horticultural Commissioner for Los Angeles county. Should he not be able to send them, write to Mr. Alexander Craw of the State Board of Horticultural Commissioners, at San Francisco. You will no doubt be able to secure some from him.

* * *

ROOT KNOT

Editor Cultivator:—We had apricot trees in an apparently good condition, on the same ground were growing white oak trees. After tne apricot trees were seven or eight years old, they commenced to die back and have not born fruit since. On examining the roots we find root knot on all of them. Was this knot caused by being damaged in cultivation or by the oak trees and what is the remedy? Peach trees in the same orchard are affected the same way.—H. P. Hudson, Escondido.

The knot on the roots of your peach and apricot trees is caused by a fungus growth of some sort. Experiments with greenhouse cultures and in the field, show that it is a contageous disease. There is no known remedy that will cure a tree once affected and permit it to return to fruitfulness. Our experience with it in the north, leads us to conclude that it is folly to try to doctor a young orchard that has become unfruitful on account of the root knot. We tried it for over ten years and quit. We tried trimming off the knots and washing the scars with a one to ten solution of bluestone and water with no good results whatever. We thought we had at first, but it only proved to be a delusion that kept us working with them for nearly ten years longer. The orchard finally went to the woodpile and we advise you to send yours there too. The oak trees have nothing whatever to do with the root knot. The fifteen acre orchard referred to above was planted partly on land newly cleared of oak trees and partly on land on which no kind of a tree had grown for 25 years. There was no difference in the qualities of knot in the different portions. Some of the worst knots were underneath the crowns where it was impossible for a hoe or cultivator to reach them. They were also found far below the reach of the plow.

* * *

TRAINING THOMPSON'S SEEDLESS VINES

It was recently stated by a horticultural writer that the growers on the desert had a new way of training their Thompson seedless grape vines, namely on wires in trellis form. That is the most profitable way to train that variety, it having been demonstrated years ago that the vines produced much more than when tied up to a stake, provided severe late frosts did not occur, in which case the vines tied to the stakes bore the most. Vines which are strung on a trellis in vineyard form have the main body of the crop from a foot to three feet closer to the ground than when tied up straight to a stake; when trained the latter way, the vegetative growth is stimulated at the expense of the fruit. When the vines are grown horizontally as when on a trellis, the circulation of the sap seems to be affected so that the vegetative growth is retarded and fruit clusters develop more abundantly. Considering all things, the trellis is the most profitable in the long run, even if the loss by frost is considerable some seasons.

CLIMATE AND CROP REPORT

CLIMATE AND CROP REPORT

Condensed from the weekly Bulletin issued by California Section of the Climate and Crop Service, in charge of Alexander McAdie.

Sacramento Valley—The temperature was nearly normal and conditions were favorable for all crops and farm work. Hop picking progressed rapidly and will be completed in some sections within a week. Dry feed is plentiful and stock are in good condition. Grapes are maturing satisfactorily; the yield and quality are reported better than last season's. Late strawberries are plentiful. Peach drying and almond hulling are progressing. Prunes are doing well. Citrus fruits are thrifty.

* * *

Coast and Bay Sections—The weather was somewhat warmer. Light rain fell on the northwest coast. Grain harvest is completed except in a few places and thrashing is progressing rapidly. Hops are in excellent condition and picking will be commenced during the present week. In the Santa Rosa and Pleasanton districts the crop is much heavier than expected and the hops are of excellent quality. Prune harvest has commenced; the crop is large and of excellent quality. Pears, plums, peaches and apples are yielding heavily.

* * *

San Joaquin Valley—Clear weather, with warm days and cool nights. Cutting and drying are progresing rapidly. In some sections the greater portions of the crop has been gathered. Prune picking has begun in most orchards. Grapes are coloring; the crop will be large. The first carload of tokay grapes was shipped from Lodi this week. Almond harvest has begun; the yield is very uneven. Stock are healthy and doing well. Pasturage is scarce.

* * *

Southern California—Abnormally high temperature prevailed in the southern portion, followed by high winds and light rain in some places. In the vicinity of San Bernardino fruit and shade trees were prostrated by the wind. The extreme heat damaged growing vegetables to some extent, but there are no reports of injury to the fruit crop. Grapes ripened rapidly and will be ready for picking earlier than usual. Oranges are in excellent condition and a large crop is expected. Walnuts are dropping and will be a short crop. Irrigating water is plentiful and being used liberally.

* * *

Eureka Summary—Harvesting and thrashing continue; reports indicate average crop. In the central and southern portions of the county barley is exceptionally good, potatoes light, apples immense; in the northern and interior portions crops are generally less than average.

Tom Johnson, mayor of Cleveland, O., is nominated by the Democrats of that State to run for Governor.

FRESNO, CAL.

Vernon Nursery

We will offer 100,000 deciduous fruit trees for sale next season

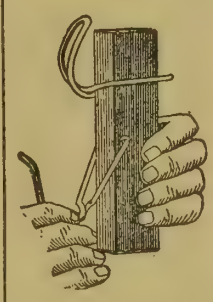
If you are thinking of planting it will pay you to give us a call before placing your order

We are headquarters for all kinds of deciduous fruit trees, nuts, grapevines, berry vines and blue gums

A day spent looking over our nursery will be money well invested

A. YARNELL.

Station K, LOS ANGELES, Cal.



Be Sure and Get

Woodward's Adjustable Prop Bracket

The Only Bracket That Will Adjust Itself to Any Prop

They are cheaper than any other Prop Bracket that can be made, and will positively not get out of order. No nails or splice to break; no time spent in repairing; can be padded if you wish without nailing. Stand props as near the bottom of trees as possible and they will not be in the way of cultivation If the Bracket is sprung apart so as to go on partway of the Prop it will take a side hold and will never slip. If the Bracket should be too loose press the sides together so as to make a little friction on the sides of Prop and it will stay in place better while being put up.

Having reduced our price to $17 per thousand, we would be pleased to have a continuance of your patronage and can fill all orders promptly.

J. K. Woodward & Co.

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

CHRONIC COUGH.

Editor Cultivator: Will you kindly inform me through the California Cultivator of a remedy for my horse, who has been afflicted with dry cough for the past two years. It does not appear to affect him seriously, he eats well and is otherwise healthy—J. A. W., Los Angeles.

Get one pint bottle of terpine hydrate and codeine sulphate. Give ½ ounce three times a day.

* * *

ECZEMA.

Editor Cultivator: Being a subscriber of the California Cultivator I wish you to inform me about a horse which is itching all the time, trying to scratch itself at every post. In constructing the stable I used boards of an old chicken house. Maybe its chicken lice or fleas. Hoping you will answer these lines I remain respectfully yours. B. Hefti, box 774, San Diego.

Treat as prescribed for eczema in several of the previous issues of the Cultivator. Chicken lice only live a few hours on a horse, they do not propagate there.

* * *

KNEE SPRUNG.

Editor Cultivator: I have a five-year-old horse badly knee sprung; worse in one leg than the other. It does not make him lame, but seems very weak and tires easily. Is there any help for it? W.

This condition is caused by a contraction of the tendons of the oblique flexor and external metasarpus muscles above the knee. The leg can be straightened by cutting these tendons by the subcutaneous operation and bandaging the legs so that the the tendons become longer in healing.

Under the new law all veterinary practitioners who do not have State certificates, must pass an examination before the State Veterinary Board by September 1st or quit practicing.

The new crop of hay is producing considerable impaction colic in horses.

MILK UTENSILS.

Milk utensils for farm use should be made of metal and have all joints smoothly soldered. Never allow them to become rusty or rough inside.

Do not haul waste products back to the farm in the same cans used for delivering milk. When this is unavoidable, insist that the skim milk or whey tank be kept clean.

Cans used for the return of skim-milk or whey should be emptied and and cleaned as soon as they arrive at the farm.

Clean all dairy utensils by first thoroughly rinsing them in warm water; then clean inside and out with a brush and hot water in which a cleaning material is dissolved; then rinse and lastly sterilize by boiling water or steam. Use pure water only.

After cleaning keep utensils, inverted, in pure air, and sun if possible, until wanted for use.

A correspondent of Hoard's Dairyman gives the following method of keeping a cow from kicking: "Take a rope of suitable size, 12 or 15 feet long, make a loop at one end large enough to slip over the cow's head and back to the brisket. Bring the rope back of the left gambrel and up into the loop on the neck. Bring the leg forward until she is brought on to three feet, tie the rope to the loop on the neck. She holds herself in good position for milking, and in a short time becomes a quiet gentle milker, has been my experience."

BEE SUPPLIES—G. G. Wickson & Co., 128 N. Main Street, Los Angeles, Cal.

DAIRY AND LIVE STOCK

C. B. SESSIONS, ASSOCIATE EDITOR

FOR MILCH COWS.

Typhoid fever has often been ascribed to a contaminated milk supply. As during the summer and fall when this disease prevails cows are frequently forced to get their drinking water from sloughs and stagnant ponds which may be contaminated with the germs of typhoid fever, it is important to know whether such germs find their way into the milk supply through the cow or by contamination of the milk after it is drawn from the cow. This matter has been the subject of very careful investigation by E. F. Pernot, the Oregon Experiment Station, who administered various germs, including that which causes typhoid fever, to a cow and examined the milk and excreta obtained, for the presence of the germs. It was found "(1) that a pure culture of typhoid bacilli mixed with water and given to the cow to drink did not pass into the milk; (2) that they did not pass from the cow alive with the excreta; and (3) that they did not pass from the cow alive with the urine. * * * Although the results in this experimnt have been negative in transmitting the germs from polluted water to the milk supply through the cow, it does not follow that the danger from cows using such water does not exist."

As cows frequently stand in the water to escape flies or cool themselves, and their udders may thus become contaminated with the polluted water, investigations were made to determine to what extent germs in this way enter the teats and contaminate the milk. "The cow used in this work was a Jersey about 4 years old, with fair shaped udder, good teats of medium size, reasonably easy to milk. The teats were dipped in water containing the germs and allowed to dry naturally. After the lapse of several hours milk was drawn and examined for the germs, but none was found, showing that they were not taken into the udder by capillary attraction through the teat orifice." * * *

There is no doubt that there is a great variation in the teats of different milch cows. A teat possessing weak sphincter muscle is imperfectly closed at its extremity and must necessarily be more accessible for bacteria to enter through the duct and invade the contents of the udder, while another teat having good muscular contracting power, would be less likely to admit germs. Yet it is almost impossible that any moist muscular orifice should so contract as to shut out an organism of such minute dimensions especially those like typhoid, which are actively motile.

It is generally believed that microorganisms gain access to the milk in the cow's udder through the teat, but in this case they did not, although the result might not be the same with all cows.

Even if it should be proven that milk is not contaminated in this way, the danger is not removed, because the body of a cow which has been wading in impure water is itself a source of contamination, since it is impossible to milk such a cow "without particles of material falling into the milk and carrying with it innumerable germs. This we know occurs to such an extent that it is customary to strain the milk to remove the particles of foreign matter. When a bacteriological study is made of this sediment the number and kinds of these germs found are truly surprising. If all the germs thus entering the milk would remain in the sediment it would be all right, but unfortunately, dropping into the milk with this foreign matter, the germs are liberated through constant agitation incident to milking. As warm milk is a very suitable material for germs to grow in, especially typhoid-fever germs, the number which would multiply in twelve hours from the few introduced at the time of milking would be enormous and dangerous." On this point, R. H. Forbes, of the Arizona Station, says:

BEE SUPPLIES—G. G. Wickson & CO., 128 N. Main Street, Los Angeles, Cal.

SLEEPY HOLLOW HERD OF HOLSTEIN CATTLE

We have just received from the Eastern States two carloads of officially tested cows. This has overcrowded us for the present, and to make room we are offering some excellent young cows for sale. They are all in calf to our great herd bulls, and right now are in fine condition to ship. For full particulars write

Los Alamitos Sugar Co., Los Alamitos, Cal.

ANOTHER PROP KNOCKED FROM UNDER HIM

Our "would-be competitor" the DeLaval Separator, in his efforts to counteract the fact that the U. S. Separator is the better skimmer, has tried various schemes to prop up his trembling frame and waning popularity.

He used to try the "Churnability" bluff, but this prop was knocked out long ago; then he howled about flushing the bowl with hot water, but the U. S. corrugated cups quieted him on that; and lately it has been the "cold skimming" dodge, whenever he has run up against the U. S., but alas this also has been knocked from under him, so that now about all the prop he has to lean on is that of "bluff."

That readers may fully realize how little ground there is for advocating cold skimming, we give below a portion of an article that appeared in the June 18th issue of *The Kansas Farmer*, headed "Abuse of a Hand Separator," by Prof. Edw. N. Webster, formerly of the Kansas Agricultural College and now one of the Government Dairy Inspectors:

"Other abuses were in time met with in the tendency of agents to follow methods that would be condemned anywhere else. One of the principles of separation understood by all creamerymen, is that the warmer the milk the more complete the separation. Yet agents will run cold milk through just to beat the other fellow. This is wrong for various reasons:

"In the first place the milk should be skimmed when warm in order to get the best separation of the cream.

"It should be skimmed when warm in order to give the calves and pigs the warm skimmilk, and

"It should be skimmed fresh from the cow in order that the cream may be quickly cooled to prevent the development of bacteria.

"Everything is against cold skimming and in favor of warm skimming, and the tendency of these contests is to give farmers erroneous ideas in regard to the hand separator."

What further evidence is necessary to convince you that the DeLaval has to depend on other things than its merits to sell its goods?

Remember, the U. S. Holds World's Record

For further particulars as to its merits, write for catalogues.

When a cow wades belly deep into a filthy pool festering in the heat and fouled with excretions, her milk will inevitably suffer. Not only will the foul odors of the water she drinks be imparted in some measure to the milk, but millions of bacteria, adhering to her hair and udder, will, when she is dried off and milked, find their way as dust into the milk pail. Quick souring of milk in warm weather and undesirable changes in butter and cheese,caused by bacteria, result.

It would seem that these are sufficient reasons why cows should be prevented from having access to foul water, but there is the additional reason of danger to the health of the animal from disease germs which may be present.

Although these are dangers that it is well worth while to guard against it is evident, as Mr. Pernot points out, "that outbreaks of typhoid fever occur which, if the cause were carefully traced, would be found to come from the milk as it leaves the cow, but from vessels which had been washed with contaminated water," and he calls attention to the fact that "since the advent of the cream separator, which is usually driven by steam power, steam has been used to clean all the utensils in the dairy. Not only is it efficient for this purpose, but as a germ destroyer there is nothing better, because it penetrates to the bottom of the seams and heats the metal to such a degree as to kill dangerous germs—U. S. Farmers' Bulletin.

HOW TO PREVENT HOG CHOLERA.

First—By keeping feeding floors, sleeping places, tanks and vessels in which swill is mixed scrupulously clean.

Second—By breeding from mature sires and dams, which will give us litters of very much more constitutional vigor than where immature sires and dams are used.

Third—By avoiding inbreeding, which will invariably reduce the stamina and invite disease.

Fourth—By avoiding fall litters. The second litter invariably reduces the mother's vitality at just the time cholera is abroad in the land, which leaves her and her litter very easy prey for disease. More than 90 per cent. of cholera outbreaks are among the sows that raise fall pigs or their litters.

Fifth—By avoiding overfeeding or any sudden changes in feed, especially from dry feed to green. Anything that will derange the stomach and cause indigestion will derange and weaken the whole system.

Sixth—By feeding (especially in growing pigs) a part ration of feed rich in protein; such as wheat, middlings or ground oats, and avoiding an all-grain ration of corn. They need something to help build up bone, nerve and muscle, which corn will not give. Nothing is better for this purpose than a good run on clover pasture.

Seventh—By taking all the care possible that the disease germs are not carried to your herd. Dogs are believed to spread the disease in the majority of cases. The germs are found in the excrement of the hogs and are carried on the boots and clothing of men or on the feet of animals and birds. It is not safe to allow stockbuyers or anyone that is around stockcars or stock yards to be around where hogs run. Doves and crows are also instrumental in spreading disease and should be shot whenever they come onto the premises. A little care in these particulars will often save your herd.

Eighth—Admit all the sunlight possible into your hog buildings and onto your feeding floors. One minute, yes, one second, of bright sunlight will kill the liveliest hog cholera germ in existance. No amount of cold will do this. See that your herd are always supplied with plenty of pure water and plenty of shade. Salt and ashes should always be at their disposal. In short, anything that will help build up a strong, healthy body will be a safeguard against hog cholera.—Forest Henry, before Minnesota Farmers' Institute.

BEE SUPPLIES—G. G. Wickson & Co, 123 N. Main Street, Los Angeles, Cal.

CALIFORNIA CREAMERY OPERATORS' CONVENTION.

The program of the fourth annual convention of the California Creamery Operators' Association, to be held in the State Fair Pavilion at Sacramento, September 10th and 11th, has been issued. There will be addresses as follows: "Some Recent Evolutions in Creamery Machinery;" "The Selection of Cows for Dairy Purposes;" "Recent Developments in Mechanical Refrigeration;" "The Skimming Station in Its Relation to the Creamery;" "How Can Our Dairy Quotations be Made More Satisfactory to Shipper and Dealer?;" "Dissemination of Cattle Diseases Through Creameries;" "Pasteurization Applied to Creamery Work;" and "Dealing With Cream Shipping Patrons."

The "Selection of Cows for Dairy Purposes" promises to be an exceptional instructive discussion. The address will be delivered by Prof. W. L. Carlyle of Colorado, with discussion by N. A. Chisholm, Jersey breeder, and Peter Krog, in charge of the herd of Holsteins owned by the Pierce Land and Stock Company.

One of the features of this meeting will be a series of cash prizes amounting to $380 for the butter contest. The judges will be Prof. E. W. Major of the University of California, and W. H. Roussel, of San Francisco. The president of the asociation is E. H. Zimmerman of Watsonville, and the secretary is Wm. H. Saylor, 114 California street, San Francisco.

WORLD'S FAIR NOTES.

All prizes in the Department of Live Stock of the Louisiana Purchase Exposition will be awarded by individual judges on the "one-judge system," and by comparison. These judges will be chosen for their especial qualifications and their intimate knowledge of the characteristics and qualities that make valuable the breeds upon which they will give judgment and their awards will be final.

* * *

Judges are instructed to award in each instance only prizes of such grade as the merits of the individual animals fully justify. Absence of competition will not be accepted in any instance as justification for awarding high-class prizes to animals of medium or inferior quality.

* * *

Only such animals as have been awarded first prizes in their respective classes will be eligible to championship awards, and the championships will in each instance be awarded by the judge who awarded the breed's class prizes.

* * *

Entries for the several divisions must be filed with the Chief of the Department of Live Stock as follows: Horses, asses and mules, by July 16, 1904; cattle, July 30; sheep, August 20; swine, August 20; poultry, pigeons, pet stock and dogs, September 10.

Coulson's No. 3 Condition Powder For Poultry

This is one of the Greatest Poultry Foods in the World

The secret formula was invented and is known only by A. R. COULSON, manufacturing chemist. The principal parts are compounded by him, after which they are mixed under his personal care in a large electric mixing machine which mixes half a ton of it in ten minutes. It is put into sacks, packages and cans as soon as it comes out of the mixing machine.

This Condition Powder is Different From Any Other Condition Powder or Egg Food

This condition powder has given such satisfaction that it is used the year round by over a thousand different poultrymen who buy package after package of it. Some of the largest poultrymen use a hundred pounds of it a month. They mix one small cupful in the feed for 100 fowls, which makes them digest food better and lay more eggs and keep healthy.

This Condition Powder Will Cure Sick Fowls

Quicker than any other remedy, it will cure Roup, Cholera, Indigestion, Leg Weakness, Appoplexy, Swell Head, etc., quicker than anything else as it acts on the liver and cleanses the disease and poisonous impurities from the system, purifies the blood and gives the fowls appetite and ambition. It cures roup and swell head because it breaks up the cold and also gives them appetite to eat and helps to digest what they do eat thus giving them strength and health.

When Fed to Healthy Hens

By its aid to digestion it enables the hens to get more strength out of the food; thus they will lay more eggs. Their combs will become bright red and healthy looking, showing good circulation and healthy livers. A great many hens are too fat and lazy; they should be given a good dose of this condition powder along with some protein feed and let them change that fat into eggs. This condition powder develops the pullets and gets the old hens down to business.

This is the Season of the Year That is Hard on the Chickens

A great many chickens and hens will get sick and die during the next two or three months unless the proper precautions are taken. Some will get other diseases.

Disease is easier prevented than cured.

A Dose in Time Saves Nine

To prevent disease and also to cure before too far gone put **COULSON'S NO. 3 CONDITION POWDER** in the feed, a little every day or a good dose twice a week. The moulting season is now at hand and the moult is a great strain on the fowl.

Coulson's Number 3 Condition Powder is the Best Tonic For Moulting Hens

It also contains the ingredients that will make the FEATHERS GROW. It is worth its weight in gold for moulting hens. No matter what food you use mix with it a little of COULSON'S No. 3 CONDITION POWDERS, during the moulting season.

It will increase your profits.

It assures assimilation of the food elements needed for egg and feather making.

It is good common sense to take care of the hens and feed them properly. They will pay you back.

COULSON'S No. 3 CONDITION POWDER makes the hens get down to business, moult quickly and get back to laying in the fall. Try it once and you will always want to use it when you see its beneficial results. We make tons of this condition powder and can furnish you with any quantity.

PRICES—1 pound can 25c. 3 pound can 50c
5 pound package 75c 7 pound pail $1.00
10 pound package $1.35 25 pound package $3.00
50 pound sack $5.50 100 pounds $10.50

SPECIAL OFFER

10 pounds sent, express prepaid, to your nearest express office station in California for $1.50.

25 pounds sent, express prepaid for $3.25. Larger quantities shipped by freight.

The Moult.

It is a great strain on the body of the fowl, and unless properly nourished with the right kind of feed, many hens will die during the moulting season.

It will pay you to spend a little extra on feed at this season and save the hens.

COULSON'S EGG AND FEATHER FOOD is what your hens need, and they need it bad at this season of the year. Poultrymen who fed
COULSON'S EGG AND FEATHER FOOD
last year during the moulting season will feed it again this year, you bet, for they know it is the boss feed to bring out the feathers in a hurry and give the hens a beautiful, glossy plumage. You can always tell a flock of hens that have been fed on COULSON'S EGG AND FEATHER FOOD as they have so much nicer feathers and better appearance.

Can you afford to neglect your hens, when you know that Coulson's Egg and Feather Food must be good, as there are 3000 sacks a month of it being used?

Ask for it at the feed stores, or send to factory.

A. R. COULSON & CO., Petaluma, Cal.

Testimonial

Malaga, July 24, '03.

To whom it may concern:—We, the undersigned, have been using Coulson's Egg and Feather Food since last February, (six months) and find that it does everything that is claimed for it and we are very much pleased with it.

Signed MISS L. M. STUDDARD,
MISS K. L. RICHARDSON.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

POULTRY-KEEPING MADE EASIER.

The Cultivator's recent invitation to prove one's interest in the Poultry Department by speaking to its editor, leads me to submit a few remarks. Having had several years of California experience in care of poultry, I feel free to state my opinions on subjects that once interested me but very slightly.

Why is it that poultry feeders continue directing the novice to soak alfalfa hay in water, either cold or hot? The hens invariably refuse to eat such alfalfa greens. They also have to be starved to make them partake of bran mash to which the greens have been added. If chopped fine in a clover cutter and fed dry very little need be wasted, but, even if fed without cutting, the hens get the full value of the stiff straws, as scratching in it to look for more dry leaves gives needed exercise.

Though I never soak alfalfa hay, I find my birds are fond of fresh alfalfa chopped and soaked in cold water. They will skim out the very last scrap of alfalfa, and drink the water as well, and fowls afflicted with roup recover on this ration and develop sufficient appetite to swallow grain once more.

Another suggestion I beg leave to offer is regarding the care of chicks in the brooder. One of the most fertile causes of loss is crowding. A very effective way to prevent the chicks from crowding together in one section of the brooder is to have the yard fenced to prevent them from getting together at any time. My easiest experience was when one long 4-section Los Angeles brooder was placed in a barn provided with windows to admit the sunlight.

Each section of the brooder had two yards, one inside and one outside the barn, a small door permitting the chicks to choose at will whether to be indoors or not. Both yards were not only fenced, but also roofed with wire netting, so fine meshed that even small chickens could not get through. This arangement kept the chickens in their proper pen, and at the same time excluded cats. The roofs were on hinges, so that a person could enter when necessary to clean the pens. However early a chick took its constitutional walk, he was sure to find water, and a little dry grain, charcoal, etc., with which to make merry until breakfast time. Cats wander about, though prevented from making depredations on the chicks. The chicks were happy always, and neither cried nor crowded.

Why is it that so few poultry writers neglect to recommend the use of sulphur and lard to keep down vermin? It is a safe and sure remedy on fowls that are three months old, and is used by mixing to a paste and applying by rubbing a little under each wing, on the head and about the vent. It need cause no commotion in the flock if done at night, one hen quietly treated, returned to the roost and the next in turn.

If the pens are kept decently clean and are sprayed occasionally with water in which a little crude carbolic acid and copperas are mixed, there will be no vermin nor offensive odors about the place and one can look at a hen every day and still enjoy eating eggs.

There is no special virtue in making hard work of your avocation if you find it possible to avoid it.

—Madam Patty Partlet.

AMERICAN POULTRY LEADS.

The Australian test of the laying quality of hens being held at Sidney, New South Wales, is proving that the American bird is a leader. In this test seventy pens of six pullets each are entered, and the egg production for the first three months, viz., April, May and June, ranges from 360 eggs from six pullets to as low as six eggs.

For this test, three pens were sent from the United States; one pen of R. C. Brown Leghorns and two of White Wyandottes. The place of honor is held by the American Brown Leghorns with 360 eggs. The next place is held by the Silver Wyandottes, owned in Australia, with 339 eggs. The third place is held by the American White Wyandottes with 302 eggs, fourth place by the Australian Buff Leghorns with 270 eggs; fifth by the American White Wyandottes with 265 eggs.

The other seventy pens were all of Australian breed; the best few of which are respectively: Buff Orpingtons; Silver Wyandottes, Black Orpingtons; Langshans; Buff Wyandottes; Silver Wyandottes; White Leghorns, etc.

In the present competition some extra cockerels were sent over and these sold for $25 each for the White Wyandottes and $16 for the Rose Comb Brown Leghorn cockerels, in spite of the fact that there were no other Rose Comb Brown Leghorns in Australia. The eggs of the leading pen in this contest weigh 24½ ounces to the dozen, as against 24 ounces per dozen for the White Wyandottes.

The age of these pullets range from 11½ months down to 4½ months. The ages of all the American birds are 11 months, and most of the Australian birds are younger.

The results of this test are such that it is determined another shall be held next year, in which 100 pens from Australia, America, England and New Zealand will compete. It will begin April 1, 1904. American breeders are invited to furnish ten pens for this competition, and Canadian breeders three. There must be nine pullets in each pen, in order to be sure that six will arrive in good condition. They must not be over one year old and must be sent prepaid to San Francisco, from which the charges will be paid by the committee to Sidney, these charges to be deducted from the money received for the hens when sold at the end of the competition. These pens must be sent this fall in order to become acclimated before the competition begins.

While large turkeys excel in weight, the smaller fat, plump turkeys will sell at a higher price per pound.

Bones are valuable for poultry, chiefly for the phosphate of lime they contain.

It is often the case with breeders that cheap birds, cheap eggs and cheap men go together.

As a rule, the pullet that begins to lay earliest in life is the one to lay the largest number of eggs through life.

The heavy sitters should have shallow nest boxes and rather flat nests; otherwise there will be many broken eggs.

All beginners in poultry raising are advised to start with a few birds, increasing the number as they learn how to handle them.

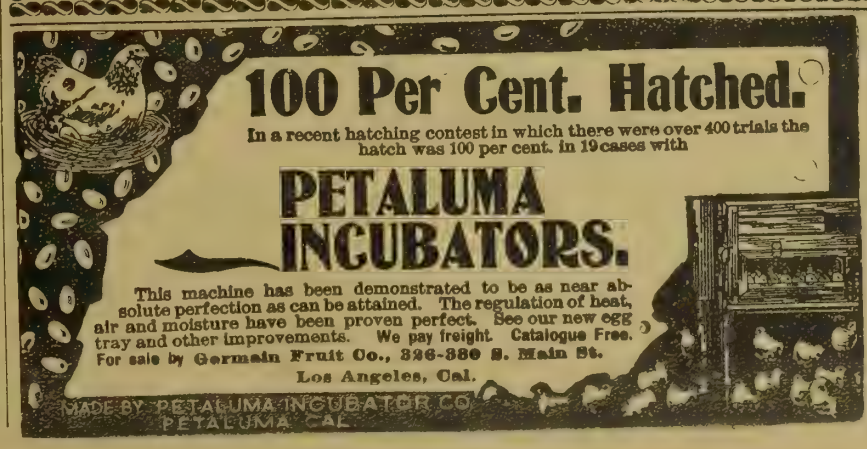
CAPTAIN MITCHELL
SANTA BARBARA, CAL.



A REVIEW OF THE BREEDS.

There are eighty-seven varieties of standard bred chickens, and each one of the varieties may be bred for a number of special objects. However, we divide all the varieties into four classes, as follows:

1. Those noted for egg production.
2. Those noted for meat production.
3. Those noted for meat and egg production.
4. Fancy fowls.

All the so-called egg breeds are sometimes called non-sitters and are comparatively small in size, active and of a nervous temperament. These fowls are great foragers and well calculated to secure a considerable portion of their living when given a free range.

Those fowls that are kept for meat production, as a rule are larger bodied, slower moving and naturally require very much less exercise than the small active nervous birds kept for egg production.

Where meat and egg production are expected to be combined in one fowl, then unquestionably one of the so-called middle breeds, or general-purpose fowls should be chosen. They should be fairly meaty, but the length of breast bone and of leg are not desirable. What is required is something of the same idea in poultry that governs the producer of Shorthorn cattle. What we want is a short, blocky body, the only difference between a Shorthorn steer and the table bird being that in the latter case the under line is of more importance than the upper line.

Fancy fowls may be kept with profit under the most favorable conditions. If one desires a particular breed of fancy fowls largely for pleasure a fair profit may oftentimes be secured, yet not so large an income should be expected from fancy breeds as can readily be secured from the breeds noted especially for their utility.

Egg Breeds	Mediterranean Class	Leghorns, Minorcas, Spanish
	Hamburgs	
Meat Breeds—Asiatic Class		Brahmas, Cochins, Langshans
Dual-purpose Breeds—American Class		Plymouth Rocks, Wyandots, Dominiques
Fancy Fowls		Polish, Games, Silkies, Frizzles, Rumpless, Yokohamas, Bantams
Most Hardy		Leghorns, Plymouth Rocks, Games, Wyandots
Least Hardy		Spanish, Polish, Hamburgs

—Up-To-Date Farming.

By feeding a variety a better appetite is maintained.

Confined fowls require bone food in some form. Where fowls have a free range there is no need of artificial preparations.

For breeding fowls, select those that come up to the standard in points, but do not discard a good specimen of robust constitution for a slight defect.

It is not always the largest fowl that is the most vigorous, but the one with full bright eyes, heavy bone, compact body and quick movement.

The cost of producing poultry meat of the form is less than the production of pork and beef, and yet it sells for as much and is better eating. Don't neglect the farm flocks.

A correspondent writes that his business is fruit, poultry, truck and dairying. This is a splendid combination of industries. The poultry can make meat and eggs out of the waste of the other three. But he must have his hands full of work.

It is only in exceptional cases that it is advisable to keep hens after they are two years old, as after that they are past their prime as egg producers and will not pay as well as pullets. The early hatched pullets and the one-year-old hens that molt early make the best winter layers, and eggs in winter pay the best profit.

MY VOW.

When I get rich, I'l quit the road for good
And stay content at home, as each man should
Who has a home wherein the faithful wife
Through years of lonesome labor spends her life;
I'll give some younger man my time worn grip
And let him take my routine monthly trip,
When I get rich.

When I get rich, at home I'll gladly stay,
And give my wife some comfort every day;
I'll smooth away the wrinkles from her face
That time has all too soon begun to trace;
I'll lighten all her labors, great and small,
And if she would consent, I'll bear them all,
When I get rich.

When I get rich, I'll give with lavish hand
To help the fallen rise in every land.
I'll give to spread the gospel far and wide,
To feed and clothe the poor on every side;
I'll advertise that I have funds to spare
In doing good to others everywhere,
When I get rich.

When I get rich. Why make so rash a vow?
A voice within me whispers, even now
Thou are already rich in resource grand—
A voice that now can cheer, a helping hand,
A heart that now should beat with love divine—
Give what thou hast, give freely what is thine,
For thou art rich.
—Charle W. Scarff, in Ram's Horn.

THE TREASON OF LOYAL BENHAM

A warmer place than Harrison's Landing on a midsummer day would be hard to find. So thought Loyal Benham, lieutenant in the Federal navy, as he steered the dingy alongside the green, barnacle incrusted piles of the little wharf. His ship, the gunboat Maenad, of the James river flotilla, was riding on the current only a quarter of a mile away, yet the bronze red foreheads of the dingy's crew were moist with sweat beads, in spite of the long service that had made even the sweeping man o' war stroke child's play to their willing arms.

Benham left the boat and went up the wharf toward the big house, once the home of a wealthy planter. It was the usual many windowed type of southern mansion, with long, low, roomy wings on each side, its facade graced with a veranda supported by noble Ionic columns. The house faced the James river. The lawn had once sloped down unincumbered to the water's edge, but now the grilling sun and the trampling of many feet had yellowed the turf.

With the house for a nucleus had upsprung that mushroom growth of war—a camp. Tents, slave quarters, and outbuildings were swarming with wearers of the Federal blue, lying in the shade or bustling to finish some work that the fates had decreed should be completed that scorching morning. Benham heard the medley of familiar sounds—the clatter of accoutrements, the neighing of horses, laughter, jests, curses, and wound through all, like a silver thread in a sombre hued scarf, the mellow, detached notes of a bugle call, robbed by distance of its persistent command. He caught a whiff of the dinner in course of preparation at the company's kitchens, but walked sturdily along through the heat waves crinkling around him to the main door of the house. Passing the great flag which was hanging dejectedly against the staff in the windless heat, he raised his cap in salute to its brilliant folds, and then accosted a sentry presiding over the entrance. "I want to see Gen. McClellan. I have a message for him from Capt. Crane."

The sentry brought with a bang his musket to present and let Benham pass. He crossed the broad veranda, entering through the hospitably wide doorway the gloom of the hall. Everything went green, then dark, before his eyes, accustomed to the dazzle outside, but gradually he became used to the change. The hall was broad and high, wainscoted with mahogany, and hardwood floor still slippery and reflectant as a mirror. In the middle of the hall a graceful spiral staircase, its carved bannister dented and chipped by vandals, wound its way to the second story. Overhead was the remains of a splendid chandelier, judging by the few prisms that still broke the light into a score of variable hues. Near the door hung the portrait of an old man of the aristocratic type, whose proud, high bred features and disdainful eyes seemed to throw from beneath their glowering brows glances of scornful hate and defiance at the unbidden northern guests. The painting fascinated Benham, and he was still under its spell, heedless of the orderly vainly trying to attract his attention wihout speaking, when the thumping clatter of a saber on the stairs succeeded in accomplishing that in which the orderly had failed.

"Maj. Graham," exclaimed Benham, turning.

"Hello, Loyal!" cried the newcomer. "Come to see the general?"

"Yes, sir; but only to bring my captain's acceptance of the general's inviation to ride with him and his staff tomorrow afternoon," answered Benham.

"The general's ridden out to Gen. Keyes' division and won't be back until retreat, but I'll give him the message myself. Come up to my room a while, won't you?" And behind the orderly's back the major went through the expressive pantomime of filling a glass and draining its dregs.

Benham accepted, and as they went up stairs the major said, "You're coming over to ride with us tomorrow, aren't you?"

"Yes," answered Benham, "and I shall be glad to see something of the country—more than can be seen from the river, I mean."

As his companion spoke the major opened the dor of his room. When Benham entered, an atmosphere heavy with stale tobacco smoke greeted him, and he could hardly restrain a gasp when he realized that he beheld the desecration of a shrine. It was a girl's room, as the remnants of dainty hangings, the muslin draped dressing table and the bed, the curtained book stand, and the delicacy of the chairs and table witnessed. But, alas, the sacrilege! Benham saw that the hangings, now dusty and dirty, had caught fire and been partly torn down, several chairs were totally disabled by masculine misuse, and sticky rings from the bottoms of glases defiled the top of the dressing table.

"Pretty place to lodge a bachelor like me, eh, Benham?" said the major. "First thing I did was to set that sham mosquito netting over the bed afire when I was enjoying a nocturnal smoke, and the whole camp crowded in here to put it out. Wish they'd done as well by me. You mustn't take a chair without careful inspection of the soundness of the legs."

"The fair owner will never recognize her room, should she ever come back," commented Benham.

"Poor girl! She must have left in the deuce of a hurry. See here." And the major opened the closet door, disclosing a pathetic display of feminine apparel, evidently collected for flight, but abandoned at the last moment. Benham stooped and took from the heap a small bronze slipper. To him there was pathos in these girlish belongings exposed to the thoughtless view of aliens. He quietly slipped the shoe into the pocket of his blouse, and though he long sat an apparently absorbed listener to the major's yarns, he was wondering if the owner of the confiscated shoe was as dainty as its size promised.

That afternon Capt. Crane told Ben-

Surf Bathing
Ever try it? The first plunge in the surf makes you catch your breath, but the fun you have after you're in, its indescribable. It's one of the pleasures that can be indulged in every day in the year at Terminal Island. Temperature of water always the same. New bathing suits at the bath house. Private retiring room for ladies. Hotels all open. The
SALT LAKE ROUTE
runs frequent trains and sells commutation tickets.

ham to take the whaleboat and depart on no less prosaic a quest than the location of a sand bank. The good captain felt that his reputation in the service depended upon the properly holystoned condition of the Maenad's deck, and the sand used for this cleanly office was nearly gone. Benham felt a little ill used, but that did not temper the heat, so he was much pleased when, after a row of six miles, he discovered just sich a white bank as the captain had seen in his mind's eye. Setting the men at work filling the sandbags, Benham wandered idly down an inviting path, allured by its promise of shade, and followed it into the woods a short distance.

Suddenly he was startled by the sound of a man's voice. He instantly drew his revolver and slowly advanced, hidden from the speaker by a tangle of vines. The path opened out into a wood road, across which a trio of untidy, ruffianly union soldiers made a barrier with their clasped hands to detain a tall, slender young woman, whose dark eyes sparkled with indignation as she confronted her tormentors with a dignity that betokened her good breeding. In spite of her coarse gown, ill fitting and shabby, Benham felt that she was independent of things external to prove herself an aristocrat of the South.

"Where are yer goin' my pretty maid?" one of the three demanded.

"An' more to the pint, what has yer got in that air basket?" asked another.

"Yer needn't be askin' so perlite," sneered the third. "You pet these snivellin' rebs like live lords; but this yer's contraband stuff and shan't get no further."

"It's nothing but a loaf of white bread and a bottle of wine for my sick father," said the girl stifling her anger in the hope of saving her treasure. "Please let me pass."

"Not so fast," said the first speaker, with an insolence of tone and look that warned Benham of the necessity for speedy interference. "We want that wine and I want a kiss. Those pretty lips er yourn are too nice to be kept fer cussed Johnnies." He snatched at the basket, catching the girl by the wrist. She winced and drew back.

Almost before her cry of terror the soldier found himself lying on some convenient blackberry briers, while his companions were gazing helplessly at the muzzle of a revolver held by a young man in the undress uniform of a lieutenant in the Federal navy.

"Now, get!" commanded Benham. "You're a disgrace to the uniform, you cowardly rascals. It's just such fellows as you are that Gen. McClellan is glad to hear of."

The three men slipped off, not daring to whisper the curses that sprang to their lips.

Benham bowed and spoke to the girl. "You can hardly bear to hear a word just now from one bearing our uniform, I fear," he said, "nor can I ever express how deeply ashamed I am of these men; yet, if you would honor me by letting me accompany you home——"

He paused and she answered him shyly. "Indeed, sir, I thank you heartily for your kindness, but my home is not far from here, and I have no fear that the men will come back" and her eyes twinkled as she thought of their ignominious retreat. "Still, if I am not keeping you from any duty——"

"Keeping me from no duty and giving me a great pleasure," he said gallantly, as they walked on together.

They soon came to a clearing and a rough log house.

"There is my home," said the girl, extending her hand to Benham; "so now I will say goodby, and again many thanks for sending those marauders away."

"Would you mind—won't you please tell me your name?" stammered Benham.

"Phyllis Yorke," she answered.

"Oh, by Jove!" he cried, remembering the name he had seen written in the fly leaf of a book in the despoiled little room now occupied by Major Graham. "Miss Yorke, I went to your old home the other day, and I want to tell you how sorry I am for it all—indeed, I am."

She looked up, wondering at his recognition of her name, thankful for the sympathy of this friendly foe, and her eyes filled with tears.

"It was hard," she said softly; then added, after a pause, "I must go now. Good evening.

(Continued Next Week.)

TOMATO RECIPES.

Baked.—To bake tomatoes, wash and dry large round ones, and remove a thin slice from the top of each. Scoop out the inside of each, leaving a good wall. Chop this pulp fine, add to it a tablespoonful of melted butter, a teaspoonful of onion juice a teaspoonful of chopped parsley and a tablespoonful of finely rolled bread crumbs to every six tomatoes. Salt and pepper to taste. Return to the tomato shells, and put on the slices that were removed from the top, place a tiny piece of butter on each, and bake about twenty minutes.

Stuffed.—Tomatoes may also be stuffed with a rice forcemeat, and baked as described above. To make the forcemeat, take one-half cupful of boiled rice to every six tomatoes. Flavor it with onion juice, a finely chopped green pepper, six finely cut mushrooms, and the tomato scooped from the shell. Season to taste with salt and pepper, and fill the shells with the mixture. Place the tomatoes open side down in a tin, place a small piece of butter on each, and bake for about twenty minutes. Remove them with a griddle turner, and garnish with parsley.

Fried.—To fry tomatoes, put two tablespoonfuls of butter in a frying pan, and add to it a tablespoonful of finely chopped onion. Cook the onion until it is yellow and remove it. Cut the tomatoes in halves, let a little of the juice drain from them, place them in the pan, and cook for five minutes. Turn them and cook them five minutes longer.

Fried.—Tomatoes may be salted and peppered, dipped into beaten egg and cracker crumbs and fried until they are brown. For these it is better not to use the onion. They are particularly delicious served with fish.

In peppers.—To stuff green peppers, plunge the peppers into hot fat for two minutes, remove and peel off the thin outer coating, which will be found shrivelled. Cut from the bottom a thin slice and remove the inside. Make a mixture of one cupful of boiled rice, one finely chopped tomato, two tablespoonfuls of finely chopped mushrooms,, one tablespoonful of butter and one teaspoonful of onion juice for every six peppers. Fill this into the peppers, place them, open side down, in a pan and bake about twenty minutes.

HOMELY HINTS.

Iron rust has a way of appearing in a most mysterious fashion. Common salt wet in lemon juice helps drive it away. When the salt is dry brush it off and add more if the stain isn't quite gone.

Javelle water is another friend to cleanliness. Half a pint of it to a quart of clear water does wonders for fine white linen stained with tea, coffee or even wine. It's a last resort after using boiling water, but of course will take color and all out of tinted fabrics.

Let the article soak in it several hours before it goes to the wash, but be sure to rinse at least three times.

This magic water is made with two pounds of bicarbonite of soda and two quarts of hot water placed in a porcelain lined kettle until the soda is dissolved, then adding one-half pound chloride of lime and stirring well with a wooden stick. When it has settled and is nice and clear, strain through a cheesecloth and bottle tightly.

To clean a carpet: Fill a pail with tepid water and add four tablespoonfuls of ammonia. Dip the broom in this, beat out the water, and sweep about two yards. Dip the broom again and go over all the carpet in this manner, changing the water often.

Wrap silverware in blue tissue paper when it is to be laid away for a time.

There is nothing better than tansy leaves for keeping moths out of woolen goods.

Learn to laugh. A good laugh is better than medicine.

WHATEVER IS, IS BEST.

I know as my life grows older
And mine eyes have a clearer sight,
That under each rank of wrong, somewhere
There lies the root of right.
That each sorrow has its purpose
By the sorrowing unguessed,
And as sure as the sun brings morning
Whatever is, is best.

I know that each sinful action
As sure as the night brings shade,
Is somewhere, some time, punished,
Though the hour be long delayed.
I know that my soul is aided
Sometimes by the heart's unrest,
And to grow means oft to suffer,
But whatever is, is best.

I know there are no errors
In the great eternal plan;
That all things work together
For the final good of man.
And I know as my soul speeds onward
On its grand eternal quest,
I shall say, as I look back earthward,
"Whatever is, is best."

BROWNSBERGER HOME SCHOOL

STENOGRAPHIC AND CLASSICAL COLLEGE
BOOKKEEPING PREPARATORY DEPTS.

953-955-957 West Seventh St., Los Angeles, Cal.

Pleasant study in the midst of the most beautiful home-like surroundings. Day and evening sessions. Shorthand made easy by famous "Chalk Talks" by the Principal. Machine at home free of charge. Spanish at lowest rates. Every graduate in a position. Ten teachers. Largest capacity in the city. The Bookkeeping is the famous Badget System. Classical College Preparatory Dept. fits for State University. Send for illustrated Catalogue. FLORIDA BROWNSBERGER, Principal.

SOUTHERN PACIFIC

CHOICE OF 3 ROUTES

EAST AND WEST

"SUNSET" Via El Paso and New Orleans

"OGDEN" Via San Francisco and Portland "SHASTA"

The service on these trains is perfect. The time is the fastest. The scenery most beautiful. The tourist car service appeals most directly to those who desire to travel at a high rate of speed, but prefer to economize a little on sleeping car accommodations The Southern Pacific runs personally conducted tourist excursions every day in the week at reduced rates to various points in the east, without change, via all routes. A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.

Los Angeles Markets.

Los Angeles, Cal., Aug. 27.

Dried fruits have advanced and the markets are very much firmer and more active than last week. Inquiries are more frequent and the buyers are in the field ready to pick up the unwary rancher.

Butter is unchanged, but the market is somewhat firmer than last week. Storage is coming out rapidly, also some eastern is being received.

Eggs likewise remain the same as last week, and the storage supply is being exhausted.

Potatoes are still weak, some fancy northern have brought as high as $2.

Hay and grain are beginning to come into market slowly and the quotations are acceptable to the producers. Good wheat and barley hay have advanced a dollar to two dollars since last week.

Barley is slightly lower.

Poultry has advanced slightly, but the market is stronger than ever. During the week buyers have been scouring the country to pick up all available supplies.

San Francisco Markets.

Dairy.

SAN FRANCISCO, August 27, 1903.—Butter prices have very slightly advanced in the past week, but the market is , if anything, rather firmer with a possibility of further advance, unless eastern shipments are attracted in sufficient quantity to bear the market. The quotations are about one-half higher than last week, and has been held level by the taking out of cold storage of a quantity of coast creamery, also of Eastern tub butter. Movement for cheaper grades has been slow.

The cheese market has been very firm at former quotations.

BUTTER—Per lb:

Creamery extras	.28	@28½
Creamery firsts,	.26	@27
Creamery seconds	.24	@25
Dairy extras	.24	@25
Dairy firsts	.21	@23
Store	.18	@20
Eastern Creamery	.23	@24

CHEESE—Per lb:

California Creamery, mild, new, extra	.14	@15
California Creamery, Mild new, choice	.13½	@14
Young America	.14	@15½
Eastern, New York Cream, Cheddars and flats, new	.14½	@16

Eggs and Poultry.

Eggs have increased very materially in select ranch, though the receipts have been very fair. Coice ranch command immediate sales at full quotations, though some from the interior have been unable to command full prices, because of the low quality from the hot weather.

EGGS—Per doz:

Ranch, selected large	.32	@32½
Ranch, good to choice	.28	@30
Store	.22	@27
Cold storage	.24	@27
Eastern	.18	@22

POULTRY—Old Roosters, per doz., $450@5; Young Roosters, $5@6.50; Fryers, $3.50@4; Broilers, large, $3@3.50; small, $2.25@2.50; Hens, $4@5; Ducks, per doz., old, $3@4; young, $3.50@4.50; Turkeys, nominal; Geese, per pair, $1.25@1.50; Goslings, $1.50@1.75; Pigeons per doz., young, $1.50@1.75; do, old, $1.50.

Fruits and Vegetables.

But slight change in the deciduuous fruit market. There have been some receipts of peaches, mostly of the better stock, which have been kept cleaned up from the market constantly. Free stone usually command top quotations; clings are more plentiful. Bartlett pears of best quality are scarce. Table grapes are in large quantity, with the market rather in the buyers' favor. Wine grapes are being quoted at $25 per ton. Cantaloupes and nutmegs are in over supply with weak markets.

The market is freely supplied with all summer vegetables. There is no improvement in the potato market, which is easy under slow demand.

APPLES, per bx, common to choice, 30@75c; fancy, 85c@$1.15; Crabapples, per bx, 25@65c.

PEACHES—Per bx, 25@75c; carriers, 50@75c; bulk, per ton, Freestones, $15@20; Clingstones, $17.50@25.

PEARS—Per bx, No. 1 Bartlett, 85c@$1; common, 30@75c; bulk, per ton, $20@35; other varieties, per box, 40@60c.

PLUMS AND PRUNES—Per bx or crate, 25@50c; bulk, per ton, $20@25, as to variety.

FIGS—Per bx, 50c@$1.25.

APRICOTS—Per box, nominal.

Hops.

The prices for new crop are 19@20c per lb., according to quality.

Eastern Markets.

New York General Market.

CHICAGO, August 26.—The weather here and abroad exerted much influence on the wheat market, and this, together with strong outside markets, created an urgent demand. There was an absence of heavy selling orders, and while profit taking on the moderate advances prevented any great break, the bullish influence increased throughout the session, final prices being about the best. September opened ⅛ to ½ higher at 80¼@80⅜ and advanced with a temporary break to 80⅛, until it touched 80¾, just before the close, which was a shade easier, at 80⅝@80¾, a gain of ⅝ to ⅞. Both the west and the Southwest were buyers in this market. Cash markets were all strong. Predictions of cold weather in the corn belt, following yesterday's heavy rains, caused free covering and resulted in a firmer tone in the corn pit. September was up ⅛ to ¼ at 50⅜, after selling between 50⅝@50¾ and 51. December closed ⅜ higher, at 51@51¼, ranging between

50% to 50% and 51¼. There was a rather strong market in oats, notwithstanding selling by the leading long holders, the strength being partly duue to the strong tone in wheat and partly to good shipping demand and decreasing receipts. September closed ¼ higher at 34⅝@34¾, after ranging between 34⅛@34¼ and 34¾.

Cash quotations were as follows: Flour was firm; No. 2 red wheat, 79½@81¾; No. 2 corn, 50¾; No. 2 yellow, 52; No. 2 oats, 32½; No. 3 white, 35@35½; No. 2 rye, 51¾@53; good feeding barley, 48; fair to choice malting, 51@52.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	24,100	15,900
Wheat, bushels	253,400	92,500
Corn, bushels	358,450	245,900
Oats, bushels	331,800	79,500
Rye, bushels	39,900	......
Barley, bushels	36,400	......

On the Produce Exchange today the butter market was steady; creameries, 14@19; dairies 13@17; cheese quiet, 9½@11¼; eggs, firm, 14@16.

Chicago Live Stock.

CHICAGO, August 26.—Cattle—Receipts, 27,000; market steady to 10c lower; good to prime steers, 5.25@6.00; poor to medium, 4.00@5.15; stockers and feeders, 2.50@4.30; cows, 1.50@4.40; heifers, 2.00@4.75; canners, 1.50@2.70; bulls, 1.50@4.40; calves, 3.00@7.00; Texas fed steers, 3.00@4.65; western steers, 3.25@4.65. Hogs—Receipts, today, 32,000, tomorrow, 25,000; 10@14c lower; mixed and butchers, 5.00@5.75; good to choice, heavy, 5.40@5.65; rough heavy, 4.90@5.45; light, 5.40@6.00; bulk of sales, 5.20@5.60. Sheep—Receipts, 30,000, sheep and lambs steady; good to choice wethers, 3.00@3.60; fair to choice mixed, 2.25@3.00; western sheep, 2.75@3.60; native lambs, 3.50@5.60; western lambs, 4.00@5.10.

California Dried Fruits.

NEW YORK, August 26.—The market for evaporated apples continues quiet and rather weak in the absence of important demand, with outside prices extreme;. Common, 4@5¼, prime, 5½@6; choice, 6¼@6½; fancy, 6¾@7½. Spot prunes steady to firm at unchanged prices, 4@7 for all grades. Apricots continue good demand and are firm, new, choice, 9¼@9½; old choice, 8¾; fancy, 12. Peaches quiet but steady; choice, 7@7½; extra choice, 7½@8.

NEW YORK GENERAL MARKET.

NEW YORK, August 26.—Wheat—spot firm, Options closed rather strong, at ⅛ net advance. May closed 88¾; September closed 87⅛; December closed 87⅜. Hops firm, State and Pacific coast, common to choice, 1902 crop, 19@25½; 1901 crop, 14@17; old, 10@12.

CITRUS MARKETS

ORANGE AND LEMON MARKET.

The shipments of oranges are nearing an end. The market is fairly steady with quick sales for prime fruit. Decay and low grades cause wide range of prices.

The receipts of lemons from Italy this month will be greater than for the same month last year:

Shipments of citrus fruits from Southern California for the season, from November 1, 1902, to date, are 21,669 carloads, of which number 2531 carloads are lemons.

AUCTION SALES.

NEW YORK, AUGUST 19.

T. C. Fr. Ex., Forget-me-not Valencias, $1.80. Oak Leaf, $1.25.
A. C. G. Fr. Ex., Red Shield Valencias, $2.40.

Total shipments to date, 21,662. Last year, same date, 16,950.

NOTES.

A movement is on foot among some of the leading Republicans to ward off the call for an extra session of Congress.

The dairymen supplying the Los Angeles milk trade have advanced the price so that now quarts are selling at $2.50 per month.

The Highland Park Improvement Association has broken away from the usual loose methods of such associations and have organized a stock company, whose business it is to look after the affairs of the community, especially as to the improvement of streets, trees, etc.

The heat of last week did considerable damage to the bean crop of Orange county.

San Jacinto Irrigation Company has let a contract for 16 miles of cement ditch. It will cost about $100,000.

TO OLIVE PICKERS—For sale a crop of Sevillano olives, exceptionally large, entirely free from scale, ready to pick in October; also some true French Picholine. Address BOX 104, UPLAND, CAL.

. . . Raisin Curing in California . . .

BY J. W. MILLS, POMONA

Last year the raisin crop of California filled 5,000 cars of ten tons each. That was next to the largest crop ever grown in the state and amounts to 100,000,000 pounds of cured raisins. In 1894 the crop amounted to 103,000,000 pounds.

The diseases common to grapes have been steadily increasing in vineyards which are not resistant to them or are so situated as not relieved as in the case of the raise of alkali where injudicious irrigation has been carried on with insufficient drainage. Under these circumstances, it is not probable that there will be much increase if any in the crop of the coming season.

Some fifty years ago, the raisin industry was in the beginning in California, the muscat, muscatel, malaga and Faher Szagos being planted in various sections of the state. The latter variety soon went out as a raisin grape but still was profitable as a dried grape. It is probably the best grape for the purpose, being very tender and sweet and an enormous producer. Zante currants were the first seedless grapes planted in the north, but owing to lack of knowledge in training them, they never became very popular. Later on, Seedless Sultana was introduced, and still later Sultanina or Thompson's Seedless was found to be much better for producing seedless raisins. This grape is now being planted in great quantities in the Sacramento Valley. It is also used quite extensively as a shipping grape, both in northern and Southern California. Malaga grapes have not retained their popularity with the raisin grower and muscat and muscatel have almost entirely taken their place.

The harvest begins in August in the early districts and in some of the Southern California raisin sections does not begin until a month later.

In vineyards where these grapes mature perfect bunches, London Layers are produced. Each picker carries two trays, one for imperfect bunches and one for perfect bunches. The trays containing grapes for London Layers are placed in one row and the trays containing the second grade and scraps are placed in another row. A man who has charge of a gang of pickers follows up the rows that have been gone over and examines the work and picks what stray bunches might be overlooked. The bunches which go to make Layers are so arranged on trays that they will present the best possible appearance when dried, for after they are cured, they cannot be rearranged without breaking the stems and thus spoiling the bunches, therefore when the grapes are placed on the trays by the pickers they are not allowed to overlap one another. With the second grade bunches, this is not important as they are afterward stemmed. The fullest ripeness is essential in making good raisins and this is determined by the color in picking. Those grapes which have a light amber color are the sweetest, though the most perfect bunches are more often of a decidedly greenish color as they are generally well shaped.

There is always a second crop of small bunches that are never picked with the main crop, as they are green at that time. They are occasionally used for raisins, but are generally sold to wineries. They ripen too late to dry, and are sometimes spoiled by the rains before they are fit for making wine.

After the grapes on the drying trays are well shriveled on the upper side and of a brownish color, they are turned. This is done by placing an empty tray on them and clasping the two so that the grapes are held firmly between the two. This is done either by quickly adjustable clamps or by the hands. It takes two men to turn the trays, one on each side. If the arms are crossed and each corner of the trays held tightly, turning can be done very rapidly by simply uncrossing the arms. The tray which formerly held the grapes is carried and placed on top of the next tray and so on through the vineyard.

The grapes dry very rapidly after being turned and care must be exercised to prevent them becoming too dry. When the berries will roll between the fingers and jelly comes out at the stem end, they should be stacked. This is done in the morning as the stems are tougher than later in the day and the bunches are not so liable to become injured. The grapes are then taken to sheds where they are placed in sweat boxes, three grades being made The sweat boxes are little larger than two by three and about eight inches deep. The bunches that are to become layers, are placed carefully in the boxes, heavy manila paper placed on the bottom between each layer of grapes. This helps to retain and evenly distribute the moisture and keeps the stems from becoming tangled. The sweat boxes are then piled up squarely one above the other

(Continued on Page 161.)

Emperor Table Grapes as Grown in Fresno County

Some of Fresno's Large Seeding and Packing Plants.

Fresno has the largest and most complete works in the world for this work. The value of the raisins passing through these houses amount to over $3,000,000 annually.

Packing Seeded Raisins.

The raisin is steamed, pressed between rubber rollers, seeds removed by machine, passed to packers who place in one pound cartons. These are next placed in cases containing 36 pounds.

CALIFORNIA JERSEY BREEDERS' ASSOCIATION.

A meeting of the above organization will be held in the Senate Chamber, in Sacramento, Friday, September 10, at 10 a. m. A full attendance of the members is requested and all who are interested in dairying are invited to attend. By order of,

PETER J. SHIELDS, President.
N. A. CHISHOLM, Secretary.

Many exchanges are giving some little attention to the Zebrula which is a cross between the horse and the zebra, and is said to be a fine draft animal much used in South Africa. Experiments for breeding this animal have been carried on for some time in that section and have developed stock which it is claimed will supercede the American mule. We hardly think this will be accomplished in our life time however, but it may be a case where the mule has a kick coming.

STATE FAIR.

From the report of the opening of the State Fair it appears that a most successful exhibit of the resources of this state is being held at Sacramento. The race track is still one of the main features, however, it is claimed that it is a more creditable exhibit along the line of manufactures and agricultural productions than for many years. The display of stock from various parts of the state and from other states is said to be most creditable and instructive. It is surely to be hoped that this season's fair will be a step in the direction of giving to our state an exhibiton which will not only be a credit to it in the eyes of Eastern visitors who may happen to attend, but that it will also prove an inspiration to the producers to make more strenuous efforts than ever toward production, which will prove a prize winner, not only as to blue ribbons, but to that which is more profitable, dollars and cents.

May this fair prove an educator along this line.

PULL TOGETHER.

Wishing to have a statement from those who are seceding from the Southern California Fruit Exchange and aiding, we believe, in discrediting co-operation as exemplified in the greatest co-operative marketing movement of this country, the Cultivator wrote to Secretary Van Luven of the San Bernardino Fruit Exchange for a statement from those who are breaking away from the Exchange. We asked for a short statement, knowing that there must be some reason for this break in the ranks. All questions have two sides and the most intelligent decision as to the right or wrong may be secured by considering both sides. Mr. Van Luven writes: "I will state that the contract between this exchange and the Southern California Fruit Exchange provides that we have the privilege of withdrawing during the first fifteen days in September in any year, and we are therefore only exercising our privileges. As to the reason for such action, a statement will be made at the proper time."

This is a little more concise than we anticipated but doubtless the proper time has not yet arrived for the general public to be informed or Mr. Van Luven would have given us the reason for the action that this exchange has taken. Meantime we cannot help but regret very much that in the face of the vast amount of fruit which must be handled within the next year that any attempt at breaking down the plans of marketing which have so successfully handled oranges for several years, should have been sprung at this time.

Scipio Craig in a recent issue of the Redlands Citrograph thus reasonably expressed himself regarding giving the fruit agency a fair trial at the work which it has undertaken:

"If thirty to thirty-five thousand cars of oranges are to go to market in competition with one another, the growers who own large acreage have much concern for the future. That a reasonable test of the California Agency plan should be given is only common sense. A reasonable test means that ninety per cent. of the growers should join. The large operators and association managers who have thus come together had to forfeit many private advantages to effect general good and to participate in it.

"If the agency plan fails, what can succeed?"

Perhaps the San Bernardino county growers expect some advantage to compensate for their jeopardizing this great movement, but they are certainly taking great risks, not only as to their own fruit, but as to the entire citrus industry of California.

The cattle men of the Middle West are taking a great step toward co-operation. A dispatch of September 2d stated that some of the representative cattle men, on that date, met in Kansas City and have agreed upon articles of incorporation for a packing company. So far as announced the idea seems to be to form a large stock company, erect a packing house merely for the purpose of establishing competition with the meat trust. The cattle of the members will still be offered in the open market, and will be sold to the highest bidder. Their own packing house will be used as a balance wheel to maintain market and protect themselves when it happens to be the will of the meat trust to put on a squeeze. The talk is that the new concern will have a capital of $500,000, and if this plant succeeds another will be established at Fort Worth.

It is gratifying to note in Mr. Isaac's correspondence in this paper that owing to the shorter time in transportation for California fresh fruits for this year that far more satisfactory prices have been secured to deciduous green fruit shippers of Northern and Central California. It has been one of the contentions of the fruit shippers in the past that lower freight rates, while this would help in the matter of profit, are not so much to be desired as quicker transportation of more perishable fruits.

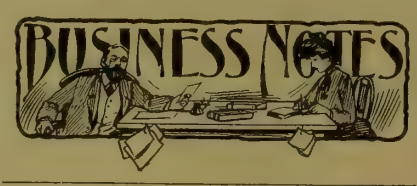
American farmers in 1890 owned $494,000,000 worth of implements, and machinery. In 1900 they owned $761,000,000. Their products in 1890 were worth $2,460,000,000. In 1900 their value was $4,739,000,000.

WILL CO-OPERATE.

A dispatch from Fresno dated September 1, says: "The California Raisin Growers' Association is a go. This afternoon the directors counted up their contracts and it was found that 90.99 per cent of the acreage was signed. This exceeded the expectation of the most sanguine, and the association will conduct business and maintain prices for the coming year."

This result is such that all raisin growers and all fruit growers of this state should take much satisfaction in. It has been one of the hardest fights the association has ever had, and has been on the verge of being thrown up many times within the last few months, in the struggle to secure the requisite number of signatures to the contract. The first effort was to secure signatures to a five-year contract, this failed, which after a meeting of all the growers that could be got together in Fresno in June, was changed to a one year contract, although at that time a strenuous effort was made to hold it up to at least three years. In the final struggle to secure signatures to this one-year contract, there seemed to be almost as much opposition as there was to the original five-year contract. A few loyal public-spirited growers have at all times been ready to sign up any contract which meant the co-operative marketing of this great quantity of fruit, but a vast number were indifferent until almost at the last moment, acting apparently upon the plan, that if the association could be a go, without their being bound to the contract, they would compel it to do so. This spirit of selfishness is one of the most discouraging features of all co-operative movements, but until human nature is made over it will have to be contended with.

Congratulations are extended to the raisin growers and may they have one of the most successful seasons ever vouchsafed to those connected with that industry.



A RELIABLE MACHINE.

The Bean Spray Pump Company of San Jose have shipped a full car of their old reliable Bean pump to their agent in Southern California. W. F. Budlong of Los Angeles is their Southern California agent, and he is busy in getting these pumps into the orchards where they are now doing yeoman's service in the control of the scale pest. The Bean is one of the oldest, if not the oldest, pumps, which have been used in destroying the scale pest of California fruit trees.

Jno. Bean, the inventor, is still residing in Los Gatos, where he constantly plans for the betterment of this machine, and this planning results in the application of many new features which are constantly retaining this machine before the orchardists and proving it to be a favorite because of its effective work, the substantial manner with which it is put up, and its durability.

Their new power machine has proved itself admirably adapted to the appliance of distillate spray, and it is so constructed that Bordeau and other corroding mixtures may be applied to this machine without injury to it. The catalogue issued by this firm is full of information for every one who contemplates spraying or the purchase of a spraying machine, and will be sent by the company to any one applying for it.

At the recent trial of spraying machines at Riverside the Bean secured a score of 27.3 out of a possible 45. This was the highest score made.

* * *

IMPERIAL.

The Imperial Investment Company are still doing things in a large way out on the "desert." The "desert" by the way is blossoming in such a way that we believe little more attention is due to it than it has been receiving and the Cultivator hopes a little later to give some items and possibly some illustrations of the blossoming of that particular section.

A CHEAP AND EFFECTIVE APPLIANCE.

"The propless tree prop" was the catchy phrase which the Hoyt Tree Support Company used to refer to their support, and it really fits this appliance which has proved most effective and most economical for many orhardists all over the state. The prop is built on the line of one limb supporting another, that is, the pressure downward of the great weight of the fruit on one side of the tree helps to hold up and support the fruit on the other side of the tree. The prop is so made that it is easily applied to deciduous trees at time of pruning. Then when the leaves and the fruit weigh down the tree, the support is already in place.

R. M. Teague, the San Dimas nurseryman, has taken the selling of this support for Southern California, and it goes without saying that he will place a vast number of them in Southern California. A. A. Hoyt who is in charge of the manufacturing plant located at Watsonville, will still control the business of the northern end of the state, and either of these gentlemen will send samples of this admirable little appliance, that every one not acquainted with its merits, may see exactly how it is applied.

The Hoyt Company began manufacturing this prop only a little over two years ago and has kept on increasing its plant until now it has a large factory, capable of putting out 20,000 of these supports daily.

Manager O. J. Weber of the Los Angeles house of G. G. Wickson & Co., is at home from a few weeks vacation and is preparing to push the interests of that reliable house in Southern California. Just at present he is making a particular pull on the improved feed and ensilage cutter. The spreading of the gospel of ensilage as being the cheapest and best feed for dairy stock has resulted in a materially increased demand for the ensilage cutter. Mr. Weber says he has it nearly to perfection in the one which he is now offering to the farmers. See Weber about it at 123 N. Main street, Los Angeles. Of course creamery separators and all creamery supplies are always expected to be found in this large house, and that expectation never meets disappointment.

* * *

A FINE OUTFIT.

S. J. Smith of Los Angeles is busy putting out one of the most reliable power spraying outfits in Southern California. It has been used and found to be entirely reliable by many farmers and orchardists. It is not only reliable, but easy of manipulation, little repairing or overhauling is needed. Of course he uses the Lambert distillate engine for power, and it has a double acting pump, especially designed for this rig. The tank is fitted with power agitator which insure perfect mixture of the solution.

* * *

WORTH THE ASKING.

One of the most complete catalogues which we have seen is that of the Fresno Agriculture Works. It has in it descriptions and illustrations of nearly every article which the ordinary farmer or orchardist would ever have occasion to use. We note on page 29 an illustration of one of the best appliances which we have seen for plowing beneath the spreading limbs of trees such as a low headed fig tree. We have not space to specify the various appliances which are there mentioned, but the catalogue is of such value that every farmer will find in it much valuable reading. The works at Fresno employ a great number of mechanics, and it is indeed a busy spot in that busy city.

* * *

S. B. Wright of Santa Rosa again calls attention of our readers to his prize winning Berkshires. Mr. Wright is carrying some fine stock as breeders from many sections of the state, as those who have purchased some of his fine blood can testify.

The Must Hatch Incubator Company announces this week that, owing to its moving into large new quarters and being so busy keeping up with orders of the past season, they will be unable to make an exhibit at the State Fair. Notwithstanding that, the Company is yet turning out incubators which win laurels when it comes to results in actual service.

GENERAL NOTES.

The late continued heavy rains of France have done damage to the amount of $60,000,000.

The state of Illinois is doing royal work in bringing to justice the principals in the recent Danville riots.

Late cold rains are injuring the wheat harvest and the growing corn crop in Minnesota and the Dakotas.

The friars ask $12,000,000 for their lands in the Philippines, while the insular government offers $6,000,000.

The output of the factories of the United States last year was $1,950,000,000 over that of the previous year.

The 40th annual meeting of the American Veterinary Association will be held at Ottawa, Can., Sept. 1 to 4.

The cruiser Pennsylvania was launched last week and will be one of the finest fighting machines in the American navy.

A girl, aged seven, died recently at Creston, Ind. An autopsy developed the fact that the child had swallowed peas whole. They had sprouted and were growing in her stomach.

The increase in the area if irrigated lands in Arizona, during the last ten years was 119,575 acres. This land was worthless without water. Its present value is estimated at $3,587,250.

The statement has been made by the officers of the Burlington Route that Nebraska produced in 1902 60,216,640 bushels of wheat. This year the output will be 25 per cent more.

It is now proposed to form a farmers' co-operative association and fix a price on everything the farm produces. On Sept. 8th the National Farmers' Convention meets in Chicago when the matter will be discussed.

Secretary Wilson has returned from his tour through the Middle states. He was pleased to find that marcaroni wheat is being grown from Canada to Texas, and is proving to be a profitable crop. Five mills are now grinding macaroni.

It was stated at the G. A. R. encampment last week by Pension Commissioner Ware that Uncle Sam now pays out annually $142,000,000 in pensions. There are now on the pension rolls 9029 men and 3662 widows of the Spanish-American war.

The Burley Tobacco Growers' Association of Kentucky, have held large mass meetings to devise means for breaking the tobacco trust. A half million dollars will be raised for that purpose. The growers contend that the trust prevents them from making a profit on their industry.

THE FLORIDA CITRUS CROP.

From the Florida Times-Union we learn that the coming orange crop is estimated at not to exceed 1,250,000 boxes. The following resume of last season's crop is taken from the same paper:

For some while yet commercial reports will mention only oranges, including under that heading both pomelos, (grapefruit) and lemons. Limes are reckoned separately.

The yield of 1902-03 should have largely exceeded the preceding one, but did not. The protracted drought in the spring of 1902 caused an unusually heavy drop, and this was accompanied by an invasion of red spider, the most damaging for years, and which therefore found many of the growers uprepared, waiting in the daily expectations of relief, so that the ravages of this pernicious pest were little combated.

The railroad handlings were close around 830,000 boxes, add to this the steamship cargoes loaded out from Jacksonville and Tampa (to Mobile) and the home consumption, we find 980,000 boxes, oranges, pomelos and lemons; worth, all around, $1.45 a box at the grower's station. A total of $1,321,000. Limes 5300 boxes, valued at $1.65 a box, making $8745.

Florida oranges this year more nearly reclaimed their high standing in the markets than they had ever done before since 1895. In quality and price, to the close of their season in Northern markets—they were substantially done by March 31—they ranked easily first; and this was more especially true of the pomelos, which outclassed all others by 25 to 150 per cent.

Coast News and Notes

By R. A. Dague, 1130 Eddy St., San Francisco

Planting of prune trees is now all the rage in Oregon.

A carload of Malaga grapes last week sold in New York for $2200.

Eighteen million eggs were shipped from Petaulma during the past four months.

Texas fever is reported as the cause of death of two hundred head of cattle in Siskiyou county.

M. L. McDonald & Co., fruit packers of Santa Rosa will have an output of about 100 carloads of fruit chiefly prunes.

Real estate is moving in the vicinity of Cloverdale. The last important sale was that of the Dingee ranch of 10,000 acres.

Dr. L. C. Kinnon, of Chico, county veterinarian, has quarantined several establishments handling horses and mules on account of glanders.

It is said that the pear orchards in Madera county show an improvement over last year. They seem to be recovering from the blight.

The tunnel in the Culver-Bair quicksilver mine of Sonoma county is 900 feet in length. Several new bodies of ore have recently been struck.

Secretary Filcher of the State Board of Trade, says that while the aggregate grain crop is less than last year, farmers will get better prices.

J. T. Green, has recently visited 134 orchards in Santa Clara county. He says this year's crop of prunes will not average more than sixty per cent. of last year's crop.

Professor W. T. Clarke says that the codling moth problem has been solved in the Pajaro valley. The apples of that section are almost entirely clear of the pest.

Finding that owners will not contract their hops at 20 cents, Eastern dealers are now offering 22 cents. The hop crop in Oregon is poor, hence California can demand good prices.

In the hop fields this year in Sonoma county it was found that a spray composed of whale oil and quassia was the most effective in destroying the hop pest.

California recently asked for 15,000 feet more of space at the St. Louis Exhibition. That will give the state 55,000 feet. The California building will be on high ground near the center of the grounds.

George Madeira is gathering California minerals for exhibition at St. Louis. He requests all having some speciments to send them to Mining Department, St. Louis World's Fair, 29 Market street, San Francisco. The railroads will transport the mineral free.

Lands are beginning to change hands in Central California. Eastern capital is pouring in. The Grogan cattle ranch of San Benito county recently changed hands. It consists of 9000 acres and sold for $137,000. It will be used by the new owner for breeding fancy stock.

There is an erroneous impression abroad as to the grape crop. It is claimed it will fall behind that of last year. While the crop is good in spots, yet as a whole it is short. The trouble is that phylloxera is spreading and there is an increasing number of diseased vines.

Col. Philo Hersey was sent to Europe in the interest of the Santa Clara County Fruit Exchange. He has returned. He says the foreign crop is not as large as estimated. No grower should supply any packer with prunes that the latter could sell for less than a three-cent base, without loss. Not over one-third of the California product should be sold even at that price.

A Grand Army camp fire was held in East Lake Park, Los Angeles, last week, made up largely of returning veterans from San Francisco. San Francisco gave the veterans a royal welcome and every other community through which they passed threw open the doors with genuine California hospitality. There are some yet in California, but many are drifting eastward.

The tobacco crop near Cloverdale is turning out well.

Eleven thousand dollars are being expended in the erection of a pickle factory at Mt. Eden.

The losses of the fruit growers in the Watsonville district from codling moth last year were a half million dollars.

It is estimated that the tonnage of beets to pass through the Oxnard and Chino sugar factories will be 300,000 tons.

The steamship lines between Tacoma and Liverpool have secured contracts for transporting 80,000 tons of wheat.

The Sonoma county grangers had an all-day picnic at Santa Rosa one day last week. Several new members were initiated.

Famine prices for hay are predicted at Tacoma this winter. Stablemen are now paying $14 per ton for timothy; alfalfa, $10; and wheat, $11 to $13. Even straw is bringing $4 per ton.

The Ablett family in Santa Barbara county, claim they have found a perfectly safe cure for rattlesnake bites. It is the application of carbolic acid to the wound. They have often tested it and always successfully.

There are two peach orchards side by side in San Joaquin county. One has been sprayed, the other [illegible] sprayed trees have produced 4000 boxes of the finest peaches ever seen. The fruit on the other trees are small and illy- flavored.

Congressman Bell who proposed at the St. Helena convention to have laws enacted to insure the purity of wine is astonished to find much opposition to some features of his proposed law. Quite a large number of vinters are opposing it.

The Southern Pacific Company have contracted for the construction of a tunnel through the crest of the Sierra Nevada mountains and the building of 45 miles of track. This will eliminate forty miles of snow sheds and reduce the maximum grade sixty-five feet.

The Fresno Melon Association has been accused of "freezing out" small growers. The president in reply denies the charge and says they cannot market more than half the crop and ship no melons weighing less than sixteen pounds. Those under that weight must of necessity rot in the fields.

Again we inquire, what is the matter that California does not produce more poultry and eggs? The total output of chickens and eggs in the United States is $290,000,000 a year. We send out of this state annually for eggs and fowls about $2,500,000 and yet we have a climate peculiarly adapted for the business. The average farmer should raise more chickens of the best strain.

A mass meeting of the grape growers took place at Stockton the 23rd ult. Charles A. Wetmore, president of the National Wine-makers Association, was the leading spirit. Resolutions were passed against the law proposed by the late St. Helena convention. Mr. Wetmore claims that the St. Helena movement would destroy the small raisers of grapes.

The State Board of Equalization has summoned the assessors of every county in California, except Los Angeles, to appear and show cause why their assessment rolls should not be raised, The investigation is now progressing. The fact has been developed that the grain farmers are not so prosperous as the fruit growers. In fact the grain farmers are not so prosperous as they were ten years ago.

Nesley Young, of Sonoma county, has invented a pruning machine. It is operated by a gasoline engine with a tank holding compressed air. The engine compresses the air and it is released by the operator and this force operates the pruning knives. These can be attached to a hose of any length and four rows of trees can be pruned at one time. High limbs are easily reached and pruned. It is said to be a decided success.

Watermelon growers of Fresno have organized a co-operative association.

The State University opened last week with an enrollment greater than ever.

Riverside shipments of oranges for this year aggregate 4,605; of lemons 335 cars.

The wine grape growers about Anaheim have fixed prices on grapes at $16 to $22 per ton.

It is now estimated that the damage to the bean crop at Orange county by the recent hot spell was 20 per cent.

Santa Barbara has called an election for September 28th to vote upon the question of extending the city limits.

Imperial is to have a new creamery which is promised to be ready by October fourth. H. F. Fuller is to be proprietor.

The people of San Bernardino were treated to a genuine back east tornado last week, which is decidedly new for California.

The Sacramento Valley Development Association is making a special effort to make a good exhibition at the World's Fair next year.

The planting of 300,000 red gums near Fullerton, has been contracted for, Richman and Mills, the nurserymen of that place having the contract.

U. S. Marshall has placed under arrest four well known young men of San Bernardino who are charged by the forest ranger with violation of the government regulation rule in failure to extinguish camp fires in the forest reserve.

Southern California is again enjoying normal weather after nearly a week of the hottest spell in its history. In some sections the temperature reached 115 degrees for two or three days, and in very many sections was over one hundred.

The Pomona and Claremont Farmers' Club will hold their annual joint meeting at the U. S. Experiment Station near Pomona on September 14th. The Covina, Azusa, Glendora, San Dimas, Uplands, Ontario, Cucamonga and Chino clubs will be invited to join this meeting.

The work of Assessor Ward of Los Angeles county in placing the valuation of that county far higher than heretofore has caused the State Board of Equalization to consider the raising of other counties in the same proportion. This has caused a tempest in a teapot, and many of the other counties are sending in protests, supported by strong committees.

RADIUM.

During recent years there has been discovered many startling manifestations of nature. The wireless telegraphy is one of the wonderful inventions and yet greater than all these discoveries and inventions is the latest—radium—recently given to the world by Mrs. Sklodowska-Currie and her husband Prof. Pierre Currie.

This new element found in the residue of pitch blend, is confounding scientists with its startling phenomena. This metal is radio-active, is more powerful than the X-rays, it having the power of penetrating opaque objects as readily as the sun does crystal. It is so luminous that print can be read by its light, and more marvelous, it has the power of imparting its own luminosity to bodies ordinarily inactive. It transforms oxygen into ozone, yellow phosphorus is converted into red phosphorus. Radium destroys the germinating power of seeds, is capable of killing bacteria and is being used in skin diseases. Diamonds are rendered phosphofescent by it and they can readily be detected from paste. Its strangest power is that of retaining a temperature higher than that of the surrounding atmosphere. Placed on a cake of ice it will burn and glow and melt the ice and continue doing so with no apparent loss is weight or power. Imagine a red hot piece of iron giving off heat endlessly without having its heat renewed. To produce radium the several elements contained in pitchblende are removed and in the residue is found a tiny speck of this radio-active element. This speck is so costly to produce that a pound of it in its pure state would cost nearly three million dollars. To produce a pound of radium two thousand, two hundred tons of pitch-blende are required.

Irrigation Queries??

Owing to some question as to the benefits of present irrigation laws, and the Irrigation Congress soon to be held at Ogden, the Cultivator submitted a few questions to C. B. Boothe, chairman of the Executive Council of the National Irrigation Association.

Owing to the fact that we had to seriously restrict Mr. Boothe in space, his answers do not enter into full detail, yet give an outline which is most instructive.

The questions submitted to Mr. Boothe are:

Wherein will there be benefit to the country from the meeting of the National Irrigation Congress?

What is the attitude of the Eastern farmer toward the reclamation of the arid West?

What is the attitude of the manufacturer and the merchant toward the reclamation of the arid West?

Will there be an effort to increase the $10,000,000 appropriation?

Is that an appropriation, or is it more in the nature of a loan, and will it ever be returned to the National treasury?

Will present holders of land within the district benefited get the advantage of the Government's expenditure, without any return to the Government?

Some of the Canals and Irrigation Systems of San Joaquin County.

May land grabbers anticipate future improvements and secure advantage and the Government's loss?

To these Mr. Boothe answers.

Editor Cultivator:—Replying to your inquiries concerning national irrigation, which seems to have been suggested at this time by the coming of the National Irrigation Congress, to be held at Ogden September 15th to 18th, your first inquiry as to the probable benefit to the country which will result from this Congress, is somewhat of a poser; I am not a prophet, nor the son of a prophet, and therefore cannot foresee what will be done or who will be present, but judging from the experience of past congresses, there will be gathered together a large body of earnest men, interested in the development of the resources and business interests of the country, both East and West, which they believe will be hastened very materially by a just application of the provisions of the national irrigation act, and by other causes, growing out of it. To attempt to reply to all your questions, seriatum, would pretty well cover the whole irrigation subject, and would require a large space, if I were able to do so to your satisfaction.

I may, however, give you a brief outline, in a general way, the information desired; invitations have been sent out to governors, mayors, commercial organizations, and representatives from the government bureaus, whose affairs are connected with irrigation matters, to appoint delegates to the coming congress, and the committee have been advised already of the probable attendance of a large number of prominent men. Papers to be read, addresses to be made, and the discussions will cover a wide field, although the intent of the managers has been to have all matters brought before congress, germane to the main proposition. There will undoubtedly be a forcibly expressed diversity of opinion, and there will be representatives of interests which are opposed to the public lands of the Nation being held for the homeseeker and actual settler; in fact, the success or failure of national irrigation in the eyes of the people of the country, mainly hinges upon this issue, whether the remainder of the public domain shall be turned over to the speculator and land monopolist, or reserved for the actual settlers, who properly claim it as a birthright, and desire to build upon it their homes and support their families. This principle is so vital to the future development of the West, which involves the prosperity of both the East and West, that no agriculturist, horticulturist, storekeeper, manufacturer or capitalist can afford to be insensible to it. I believe that all of these interests generally, when the true facts are made plain, uniformly uphold the policy of the National Irrigation Association.

Your reference to the attitude of the Eastern farmer, towards the reclamation of the arid West, reminds me that some of the Eastern agricultural papers have assumed that the development of the West means a competition which would be unfavorable to their interests; inasmuch as the irrigated lands of the West have not, so far, and will not likely, raise crops for shipment to the East in competition with the Eastern farmer, but on the contrary, are large consumers of the manufactured products of the East, which create valuable home markets for the Eastern farmer, it is difficult to see what reasonable argument can be produced in favor of their contention. From the diverse interests in the West, the main objectors to the policy of the National Irrigation Association, being those who are generally described as cattle men who desire to have and control large areas of land for grazing purposes, statements intended to be prejudicial to the cause of National Irrigation appear in the public press, both East and West. To what extent this education is influencing public opinion is difficult to state. Land grabbers and others who are trying to secure some advantage under existing laws, seem to be co-operating with the cattle men to prevent what is now recognized as important legislation, necessary to protect the interests of the people, viz., the repeal of the Desert Land Act, the commutation clause of the Homestead Act, and Timber and Stone Act.

A discussion of these acts will be a very important feature of the coming congress. With the repeal of these acts it is believed that the land grabber will be unable to take advantage of the National Irrigation Act, except in the same manner as that of any actual settler. The appropriation made under the national irrigation act is in the nature of a loan without interest, and under its provision all the money expended will be added pro rata, to the price of the land, and returned to the government in ten annual payments.

An area of about twenty acres is to be devoted to an exhibit of taking water from canals, rivers, and laterals. And new methods of irrigation will be shown, together with data from a practical demonstration of losses incurred in transportation of water and various other experiments in matters connected with irrigation.

To return to your first question regarding the benefits of the coming congress, to the people of the country, I would say that every delegate who attends this congress will receive personal benefit by coming in contact with live, practical men from all parts of the country, and by contributing his share of knowledge and experience; and it is hoped by the association that a large and influential delegation will go to Ogden. The railways have shown their encouragement by making one fare for the round trip, being $43 fom Los Angeles to Ogden and return. Tickets will be on sale September 12th and 13th, good to return to the end of the month.

Wishing you increased circulation and growing prosperity for your valuable paper, I remain, very truly yours,

C. B. BOOTHE,
Chairman Executive Council National Irrigation Association.

FROM A BUSINESS STANDPOINT

By J. W. Jeffrey, Los Angeles

LIGHT ON THE SITUATION.

The Fullerton News seems to be headed toward the light that it should long since have been in the glare of, had its editor kept his mental forces moving in the right direction in the investigation of the orange selling business. It may be the Cultivator has not been of much service in lighting the path of the News toward a fairer view of the situation of today. Such is the claim of the Fullerton journal, at least, but its editor must remember his paper has been in the public eye only a week or so upon the question of marketing fruit. What may seem good sense to the Cultivator may be deemed rank folly to those who have to look at the fruit business from a point of view held by a community never very enthusiastic upon the co-operative effort. Be that as it may, the News has opened its understanding box sufficiently to allow the driving in of a few facts, and the effort to do so will be appreciated by those who accept an honest effort as evidence of good faith.

"From our present information we are led to believe that the Citrus Union is a combine of these former cimmission men; that the Cultivator early and late held up as parasites and even robbers of the citrus growers," says the News. The News is correct in stating that the Cultivator has for years been opposed to the dealers' methods, and has not hesitated to hold up as dangerous all commission dealing in which the grower has no protection in the eastern markets. The Cultivator has opposed speculation in citrus fruits, selling in competition with the fruit of the Exchange and a dozen other inseparable abuses that had fastened themselves upon the business as it was conducted before the formation of the California Fruit Agency last spring. Now if the News man will consider for a moment what a radical change has occured in the business of the former dealers, he will discover that the members of the Citrus Union have come to the Cultivator's point of view, and that this journal has not changed one whit from the position it has held for the last ten years. Let us see what the members of the Citrus Union have given up, in making the arrangements to sell their customers fruit upon a general co-operative marketing agreement, the light must be let in upon the installment plan, and, though a good fellow, who can take a roast like every thoroughbred newspaper man should, the News man is so contrary that his enlightenment should be given in negative lines.

The Citrus Union will buy no more fruit on a speculative basis, its members have agreed to render to the grower every cent the fruit brings, above a contract price for packing and selling; the Union will buy no more fruit on any basis; there will be no more lump sum deals, no proselyting of Exchange members; the patrons of the Union will not be compelled to maintain three packing houses where one can do the work; there will be no cutting of prices in the markets of the country, for one agency controls the distribution of all the fruit in the organization and the agents have no interest in anything but the best methods of selling the fruit, the promptest returns and the administration of their office in such a manner as to make their tenure sure; there is no incentive to market manipulation by anyone, but there is the greatest reward for the proper distribution of the fruit and the securing of the most lucrative returns. In short, when the dealers surrendered all the prerogatives of dealers, speculators and independent commission men and became merely fruit packers and sellers through a thoroughly co-operative plan they ceased to represent all that the Cultivator condemned as speculators in fruit and opponents to the Exchange. They now occupy an entirely new relationship to the former co-operative growers, and in support of the new agency the Cultivator is still advocating practical co-operation as embodied in the new arrangement.

The Cultivator did not make the conditions that compelled the mutual operators and outside firms to unite into one selling agency. On the contrary this journal fought for a whole decade for a complete unity of the growers into one organization—the Exchange. With one-half the growers standing out, apparently for all time, refusing to do anything but accept the gratuitous protection offered by the Exchange, what other solution was possible than the one adopted, after the most mature consideration. By surrendering the prerogative of speculation, the profits of which were some seasons simply enormous, ten members of the Citrus Union have placed themselves upon the side of co-operation. It is true they pack the fruit upon an agreed price of so much per box. Some of the Exchange associations have their fruit packed by contract also. The members of the Union sell the fruit for a stipulated price per box. Much of the Exchange fruit was sold for so much per box at auction before it united in the selling agency. If we agree that the Exchange could never win over the outside growers and make them members, which every one believes to be true, then there is no chance for criticism of the consolidation. The few who have gone out of the Exchange in San Bernardino county will have a rocky road. They have placed themselves in opposition to public sentiment, against co-operative marketing in its broadest sense, which is the vital sense, being in relation to the fact that only a great, strong organization can compete with the opposition that will increase as other citrus countries develop the industry, and they have placed themselves in opposition to their former co-operative associates, which is the most dangerous position to assume. Those who can understand what a complete revolution there has been in the operations of the members of the Citrus Union, can see that these companies have taken sides with the Cultivator and the Exchange. There has been no change in the policy of this paper.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.
(Continued.)

In our last article we discussed that sub-order of Neuroptera with incomplete transformations, or the Pseudo Neuroptera. As we have seen the Neuroptera proper are complete in their transformations and therefore seem much higher than the others of the group. Indeed, if we separate into different orders, we would place these insects much higher. Prof. Comstock, in his classification, puts these true Neuroptera above the locust and the bug orders. These insects agree with the others in their typical mouth parts and netted-veined wings.

* * *

Hellgramites.—The Hellgramites family Sialidae, also known as Dobson flies are among the largest of insects. They remind us of the May-flies discussed last week, but pass through complete transformations. As these are very rare in California and indeed in all sections where fresh water pools are scarce, we will say little of them. The great larvae live in water and can often be found by lifting stones even in rapid running streams. These larvae are often much used for bait in fishing. They are also excellent for laboratory use as it is easy in dissections to discover and separate the various internal organs. I have missed them in my laboratory work at Claremont.

There are also two families of Neuroptera proper which are very limited in numbers which resemble the mantis, or praying mantis as it is called. But the character of their wings as also their complete transformations fixes them among the Neuroptera. In the imago of the two families, the prothorax is very long. One of these, a Raphidia is quite common in California, as nearly all my students get it in their collections.

The larvae of some of this family, Raphidiidae, are said to destroy the larvae and pupae of the codling moth. The others from their still closer resemblance to the mantis belong to the family Mantispidae. These even grasp as does the praying mantis, by the use of their front feet. The larvae are said to live largely upon spider eggs.

* * *

The Aphis Lions—Nearly all of our orchardists in California are familiar with the Chrysopa fly. This very delicate green lace-wing is common in our orchards. It is curious in laying its eggs on the ends of hairs which are attached to leaves, twigs and sometimes even to fruit. The larvae is somewhat louse-shape in form but has for its size, enormous jaws and is one of the most voracious insects to be found in bush or field. It is well called aphis lion for upon close observation we readily discover it devouring great hosts of plant lice. It is to be regretted that it does not stay its greedy appetite wholly with our enemies. It will be remembered that when the Rhizobius was introduced into the Southern California orchards, they soon disappeared and we could hardly find a specimen in our orchards, even though thousands had been liberated only a short time before. A little investigation showed that their taking off was largely due to these aphis lions. I have sometimes taken a half dozen of the Rhizobius larvae onto a sheet to find every one of them with the blood stain marks showing that they had been victimized by the Chrysopa larva.

The pupa of this aphis lion is very small and is almost a perfect sphere. it is inclosed in a pearl like cocoon of glistening silk. From this soon comes the beautiful green Chrysopa fly with its gauze like wings folded rooflike. It is probable that we receive great benefit from the work of these aphis lions although they are not always as discriminating as we should like in satisfying their appetites.

Closely allied to the aphis lions are the Hemirobians. Indeed, the larvae not only look much alike but have the same habits. As these insects are not very common in California, we will not discuss them further.

* * *

Ant Lions—What observant boy has not discovered the little funnel shaped excavations in the sand of field or roadside? If curious, he has looked into the cause of these regularly formed earth-funnels and has found at the bottom a larval insect which closely resembles the aphis lion. As he kneeled beside the insect trap he has discovered the purpose of the excavation and has learned full well why the name ant-lion is applied to these hungry insects. Some luckless ant or other insect in its quest for food passes the edge of this funnel, when it is pelted with a sand bath far too energetically to be agreeable. The sand shower, together with the steep wall of friable sand causes the ant to fall to the bottom of the hole, when it is at once grasped by the waiting ant-lion, which is wholly concealed if we except its strong jaws. The rapid motion of these jaws caused the sand shower. The same jaws now grasp the victimized insect, which has indeed entered into the jaws of death. The larval ant lion shakes the helpless ant which is soon lifeless and bloodless. The pupae of these flies remind us much of the others, as they too are in the shape of a ball and are enclosed in a cocoon. The imago would be taken by the uninitiated for a dragon fly, which they resemble very remarkably both in form and general appearance. The venation of their wings, however, is quite different. It is very easy moreover to separate these at once from the dragon flies as they have obvious antennae, which though short are never hard to find. It will be remembered that the antennae of dragon flies are very greatly abbreviated.

A small family known as scorpion flies I will only refer to in passing. They are called scorpion flies from the fact that the tip of the body of the male resembles strongly the body of the scorpion.

* * *

Caddice Flies.—We will close our discussion at this time with the consideration of these insects which are exceedingly interesting, not only from the curious protection which the aquatic larvae fashion about their bodies, but also from the fact that the lover of trout fishing finds these an ever waiting bait in our California mountain streams. The front wings are thick and root-like. The eggs are laid in the water and the larvae as soon as hatched fashions pebbles, twigs and even snail shells into a hollow cylinder which encase, and so protect his body. He has six legs at his head end, which is always at the open end of his cylindrical shield. By crawling out he can pull his case along and thus search out his food. In case of danger, he quickly retreats into his cell. I have often found a dozen or more of these under a single stone in Mill Creek. It is very easy because of these to get bait for trout fishing. The pupae are found in the same cylinders and in late summer it is not uncommon to find the thick winged imago.

We see that all of these Neuroptera proper are predacious and so are great friends of the farmer and horticulturist. As was noted in the article of last week, all Neuroptera except white ants place us under obligations for their good work in destroying our many insect enemies.

* * *

SUGGESTIONS ON SPRAYING.

I feel justified in bringing this topic to the notice of our readers again as within a few days I have had inquiries from two of our best Horticultural Commissioners, from one of our best growers, while the other night Secretary V. V. Leroy of our Claremont Farmers' club asked me to meet a number of his neighbors at his house to discuss the question of spraying and the advisability of neighborhood spraying machines. Prof. C. B. Sumner who has very fine orchards and whose judgment in all matters of citrus fruit growing is valued very highly by all who know him, has just driven me to his orchards that I might advise with him as to the how and the when of treating his orchard for black scale. Surely if there is so much of inquiry in the air and that from those who are best informed, it is almost certain that the rank and file are also eager for further advice in this matter of spraying the orchards.

Suggestions.—Close observation in the orchard shows that the black scale is hatching this year very much more uniformly than usual. This will make it possible with care to do very perfect work in their destruction. In examining Prof. Sumner's orchards today I find that not quite all are hatched out, and none are so large but that I think they will be killed by a thorough spraying done three weeks hence. I believe in the lapse of three weeks all will be hatched, so I suggest to Prof. Sumner that he wait three weeks and then spray his orchard. I believe in this case providing the spraying is well done that he will not need to spray at all next year and possibly not for two years. Prof. Sumner asked me whether I would spray or fumigate at the same price. I told him I would spray, as I find that there are quite a number of red spiders in his orchard, which are even now causing the leaves to turn yellow and the spray will certainly kill these while fumigation does no good.

Yet we must remember that spraying does not cost as much as fumigation. If one does his own spraying I believe he can do it at one-third the cost of fumigating.

I would use for oranges two to two and one-half per cent. distillate. I would get the distillate of the Southern Refining Company of Los Angeles as I have never yet heard of any complaint of the distillate they sell for such use. For lemons I would use from three to three and one-half per cent. I am in doubt why lemons stand a heavier per cent than oranges. May it not be because of the thickness of the foliage we are required to spray longer on the oranges to do as effective work, and therefore get as much real distillate on the trees with the two and a half per cent as we do on the lemon in using the three and one-half per cent.

Again we must bear in mind that spraying as well as fumigation is hard on the trees. Therefore every person should see to it that the orchard is in the very best condition of thrift and vigor at the time of spraying. It should have been irrigated a little before and thoroughly cultivated. If the leaves drop after spraying it is simply an indication that they are already weakened by the red spider in which case the spraying will do much more good than harm or else that the above rules have not been followed.

It is very important that the work be well done. Does this not require in most cases that the owner of the orchard should be on the spot all the time, even though he is not one of the workmen? Such particular work cannot safely be left to irresponsible men. I fully believe that it will pay every neighborhood to own its own spraying machine. I believe that ten neighbors owning each ten acres of citrus orchard can buy a machine and not only pay for it in the saving the first year, but also have a good amount of money left. A very signal advantage of this lies in the fact that then they can have the machine just when they wish it, which I think is a very important matter. It may also be said that it will only take a small part of the season to do their own work, after which they can loan the machine and make a goodly sum, beside aiding other neighbors who have not been as provident as they. In case this advice is followed I would suggest that the best machinist of the ten should take control of the machine and act as manager for all of the orchards and that the owner of each orchard shall engage to hold one of the spray nozzles while his own orchard is being treated. This can hardly fail to result in very careful work. Riverside, according to reports, has evidently been working somewhat upon this plan. It is stated that she has bought twenty machines in the last few days.

* * *

SUNDRY QUESTIONS.

John Moore of Playto, California, asks the following questions: "How can I get rid of willows? The more they are grubbed out the more they grow. The land is sandy." As I have frequently stated in the Cultivator, if they are kept entirely from growing so that no green at all appeared they will die soon.

Second: "My water melon vine turned brown in the center, which gradually extends till the whole vine dies. State cause and remedy." This is undoubtedly the melon blight which has been quite bad in some parts of Santa Barbara county. As I have stated before changing the location of planting, though only for a few rods, frequently effects a cure.

Third: Tomato vines turn pale and dry up, and the fruit is very much injured. What is the cause and is there a remedy?" This is probably also a blight. The vines should be watched and as soon as they show disease they should be pulled up and burned. It is also wise to treat the vines with Bordeaux mixture.

"Fourth. "Is there such a thing as over cultivating tomato vines?" I should say no. Of course cultivation beyond what is necessary does no good and is a waste of time, but that it ever harms the plants I think very doubtful.

* * *

PICKLED BROOD.

There has been considerable inquiry of late about a new bee malady which has been reported to be fatal. As I have been asked several times my opinion of this, I am constrained to make answer, although I do it reluctantly as I have not yet seen a case of the trouble. I wonder if it may not be a case of the so-called "pickled brood." In this case the brood dies but does not look at all like foul brood or the less common black brood. There is a slight odor of fermentation and hence the name pickled brood.

I was very much interested in the opinion of one of our ablest authorities, Mr. France, at the recent convention in Los Angeles that pickled brood was the result of improper nutrition from some cause or other. The first year after I came to Southern California—1894—my bees and others commenced dying quite seriously in this same way. Close observation showed that in every case there was a scarcity of honey, though never an entire absence of it. I then thought of this mal-nutrition and fed my bees, when, in every case the disease at once disappeared. I then said that I believed that too much fasting was at the root of the trouble. As I heard the address the other day I thought at once of my experience of the past, and would suggest to those suffering at the present time that they try feeding and see if they do not get benefit. I shall very soon give in the Cultivator quite a thorough discussion of this whole matter of bee diseases, as it is certainly one of the most vital points connected at present with bee culture.

The Hoyt Tree Support

Exemplifies the Saying That "Necessity is the Mother of Invention."

And Invention is the Mother of Necessity. That is, this invention, after its use by the fruit grower, proves itself a necessity for the best care and protection of Trees. This necessity has compelled the erection of large works for the manufacture of this wonderful little prop and every section of the state is calling for it.

It has been only two years proving itself a necessity, but it is so admirably adapted to supporting trees overloaded with fruit, to correcting trees which incline to grow unshapely, and will often preserve the balance of the tree when otherwise severe use of the pruning knife and saw would be necessary. But its great point is in the ECONOMY. ECONOMY as to price when purchased and ECONOMY in the time required to apply it. No stakes are necessary. ECONOMY in this, that the props may remain in the tree from year to year.

"As the Twig is Bent, so is the Tree Inclined."

Twigs bent out of shape by heavy crops soon spoil the tree.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

SEPTEMBER VEGETABLE CALENDAR.

A few more sorts of vegetables may be planted in September than was advisable during August. The hottest weather is now past and we must begin to look forward to winter crops. The following may be planted: Beets, beans, cabbage, (seeds or plants of early sorts,) carrot, cauliflower, (seeds or plants,) kale, kohl rabi, lettuce, onion, parsnip, peas, radish, spinach, turnip.

* * *

AUTUMN LAWNS.

Don't forget that fall lawn planting may be done in September with excellent results, though watering must not be neglected. Furthermore do not fertilize lawns until frosts are over.

A subscriber asks where she may obtain seeds and bulbs of native plants.

Germain Seed and Plant Co., of Los Angeles and Dr. F. Franceschi of Santa Barbara handle a great many of each, but we have, in Mr. Carl Purdy of Ukiah, Cal., a bulb specialist, dealing in native stock only, who is known all over the world. One correspondent asks about seeds of Mariposa lilies, but these are a slow and uncertain crop from seeds and should, in all cases, be bought as bulbs.

* * *

FUCHSIAS.

A correspondent asks if the fuchsia may be propagated from cuttings, how it should be done and when.

Few plants root easier than fuchsias as ordinarily handled by nurserymen. The writer has put in a lot of five hundred cuttings and never noticed a cutting that died, and believes everyone of the lot rooted. They will root any time during the winter if the plants from which cutting were taken were growing well, if parent plant had been dormant for a time, failure would result. We nurserymen prefer to use pot plants even if we have to lift large plants from the ground, take large plants and wait until the higher temperature has induced a new growth; these are the cuttings which will root the more readily. Do not bother with old or stunted wood nor with that which has suffered from too cold weather. Use pure sand.

* * *

AMARYLLIS AND POINSETTIAS.

Editor Cultivator:—Will you kindly give information as to handling of amaryllis. As soon as the blossoms begin to open may the blossom stem be cut close to the ground, without injury to the bulb? Is there any way by which I may be able to secure a greater number of bulbs from this plant, whose increase is so very slow? When may it be transplanted? How many sorts of amaryllis are there?

Also kindly give instructions regarding pruning and handling of the poinsettia. May it be thumb pruned so as to make it branch out, while it is growing, or should it be allowed to grow up in a strong stock until dormant, and then cut back? One of my plants which was frozen last year has been sending out a single stalk, which is growing exceedingly strong and thrifty, having now gone up some five or six feet. Apparently it is yet full of sap and not hardened at all. Should this plant be deprived of water so as to harden the growth, or should it be kept thrifty, and will it harden its growth before danger of frost? May it propagate from the cutting when the plant is pruned, in the winter, if so how should this be treated?

The blossom stem may be cut from the bulb at any time after the flowers begin to open, without doing any injury thereby; the bulb will no doubt be benefited by such treatment. The quickest means of increasing your stock is by growing from seeds; they seed very freely and the seeds should be sown shortly after being gathered, or at once, do not plant them too deeply. Seedlings will flower the third year, in a few cases, during the second.

Increase may also be effected by offsets which should be taken in early spring and treated same as old bulbs. Spring is also the best time for transplanting, for they flower in July and August, after which they make a bulb growth until cold weather, and this growth should not be interrupted. When moving old bulbs, take plenty of earth with each bulb as they do not like their fleshy roots mutilated.

There is but one species of amaryllis, (a belladonna), known as the "'Belladonna Lily," though the species has two varieties, belladonna major, and belladonna minor, the latter being by far the best. Both are a clear pink in color but major is often nearly white inside the corolla. Amaryllis are natives of Africa while the bright red and white flowers known as amaryllis are hippeastrums from South America and most of what we see are known as hybrids of H. vittatum. These latter should be given the same treatment as the amaryllis.

The poinsettia, known to botanists as Euphorbia pulcherrima, is a native of Mexico and require heat at all times; therefore plant in the hottest and sunniest place you have, but a protected spot if possible for the

A California Pioneer.

Date Palm at San Diego, 121 years old.

plant is hurt by even a slight frost. It is best pruned in spring only and the first spring should be cut a foot above the ground and every spring thereafter leave but one foot of the previous year's growth. In this way you will get a fine sturdy plant, capable of producing an immense crop of the scarlet bracts.

The hardwood cuttings may be planted out just where you wish them to grow. It would be as well to withhold the water supply from your soft growth, for, though it might harden up before frost even with present treatment, the riper the wood is the better it will stand the cold. As stated above your plant should be pruned in early spring a hole made in the ground, for the cutting by using a stake somewhat larger than cutting, and plant two to three inches in the soil. The cutting may be of any length, but six to eight inches long is about right Cut the bottom end on a slant, about one half inch below a joint. The cuttings are easy to handle in any soil, but do not overwater.

CLIMATE AND CROP REPORT

Condensed from the weekly Bulletin issued by California Section of the Climate and Crop Service, in charge of Alexander McAdie.

Sacramento Valley.—Almonds in Yolo county are ripe and picking is in progress; the yield is about average. Grapes are ripening rather slowly, but are of excellent quality, and there is a heavy crop in all sections. Wine grapes would be improved by warmer weather. Heavy shipments of grapes and fresh fruits are being made from Sacramento. Cool weather during the season has retarded the early ripening of prunes, but this is regarded as favorable, and the crop will be large and of superior quality. Hops in the vicinity of Sacramento are nearly all harvested; the yield is about average and quality good.

* * * *

Coast and Bay Sections.—Clear, warm weather prevailed during the week, with occasional light fogs in the coast districts. Grapes and deciduous fruits ripened rapidly and conditions were very favorable for fruit drying. Prune picking and drying are progressing; in some sections the crop is reported light, but of excellent size and quality; other sections report a heavy crop. Grapes are in excellent condition and will yield a large crop in all sections. Almonds are ripening. Hop picking is in progress in Sonoma and Mendocino counties; the crop is heavier than estimated and the quality very good. Sugar beet harvest has commenced in Monterey county, and the crop is reported fair.

* * * *

San Joaquin Valley.—All of the early peaches are dried or are on the trays, and of the late free peaches only a small portion will be dried, as the demand for them fresh is good. Prunes are ripening slowly; the crop will be below average, but the quality is excellent; picking will become general this week. Almond harvest is progressing; the yield is variable, but quality excellent. The fourth crop of alfalfa has been harvested in some sections. Grapes are coloring well; the crop will be slightly below the average for raisin grapes, but shows a high per centage of sugar. Picking has begun in a few places. Large quantities of table grapes are being marketed. Stock are in good condition.

* * * *

Southern California.—Deciduous fruits and grapes ripened rapidly, and conditions were favorable for beans and sugar beets. The hot weather of the preceding week caused some damage to lima beans and late potatoes in Orange county. Grape picking has commenced in some places and will be general within a few days; the grapes are said to be of superior quality and the yield is large. Melons are plentiful. Citrus fruits are in excellent condition. Walnuts are maturing.

* * * *

Eureka Summary.—The barley crop is excellent; grain heavy. Thrashing progressing rapidly; in some localities oats and barley are all harvested. Some early appels are being gathered for the San Francisco market.

JOHN ISAAC, SACRAMENTO

STATE FAIR AT SACRAMENTO.

The State Fair opened on Monday at Sacramento, and while the first day at a fair is generally an off day, there was a much better attendance and a better programme on this occasion than usual. Grove L. Johnson, superintendent of the pavilion, J. W. Wilson, superintendent of the track, and the secretary, Harry Lowden, have all done yeoman's work to make the present fair one of the most successful we have ever had. Some of the best racing events in the history of the society are promised, as the track is in first class condition, and some of the finest stock in the county has been entered. The exhibit at the pavilion is a remarkably good one. The display of fruits and agricultural products is large, well displayed and the specimens such as to astonish the visiting G. A. R. excursionists, many of whom are remaining over at Sacramento for this occasion. There is also a very creditable display of agricultural implements, and machinery and farm appliances. The whole is well arranged in the most artistic and striking manner. Every progressive farmer owes it to himself to visit these fairs, for the hints, suggestions, and information he can gather at them is of incalculable value to him.

* * *

GOOD WORK OF THE AGRICULTURAL SOCIETY.

The State Agricultural Society had its inception almost contemporaneously with the agricultural interests of the State, having been organized in the '50's, and in the early days it did good work in advancing the farming interests of California. The track was always a feature of their annual fairs, and a good one, but this feature gradually overshadowed the rest, until it degenerated largely into a mere gamble, and the producing farmer to a great extent abandoned the fairs to the racing fraternity. Under the new management a very strong effort has been made to correct this, and while racing events have been made a strong feature of the present fair, the other features which are of more interest to producing agriculturists and horticulturists have not been subordinated to them. The present board of directors have commenced their work in good shape, and it is to be hoped that the Agricultural Society will once again be to our producers all it was in early days.

* * *

HAY FARMERS GET GOOD PRICE.

The hay farmers of the northern counties seem to have profited from their experience in the past. Last season there was a good demand for hay and it brought very good prices, which should have helped the farmer, but it didn't. The advance did not take place until the crop was well out of the growers' hands and in those of the speculators, who formed a little combine of their own and pocketed the profits of the farmers' hay crop. This year the farmers are holding out for the profits themselves and are keeping back their hay for better prices. In the bay counties hay in the field is being held at $12 and consumers are paying from $13 to $14 for it. The man who has hay now in any of the counties around San Francisco has a good thing to hold on to, as there is every prospect of an advance even on these prices. As the crop here this season has been a very good one, it is to be inferred that if the farmer is not in clover he is at least in a good substitute for it.

* * *

PLENTY OF HELP THIS YEAR.

It is encouraging to note that as the fruit season advances the labor shortage which was feared at its commencement is not nearly so bad as was anticipated. Perhaps this was for the reason that it was looked for and our canners and packers were very largely prepared for it. The season is now well advanced and while there is ample work for all who wish it, it is evident that the unusually heavy pack of fruit this season will be handled without much trouble and with very little loss. This is a great improvement on the state of affairs in the labor market at the same time last year.

* * *

FRESH FRUIT SHIPMENTS PROFITABLE.

This has so far been a good season for the shippers of fresh fruits. Prices have, as a rule, been very satisfactory, the markets have not been glutted, and there have been few red ink returns. This is due very largely to the efforts of the California Fruit Distributors, who have kept in close touch with the Eastern market continuously and have sent shipments only to those points where there was a demand, and have carefully avoided glutting any point. There has been, too, better service on the part of the railroads this summer than heretofore and fruit has reached the markets in better condition. Grapes are now going forward from Sacramento and the first car load brought in New York $2200. We believe this is a record price for grapes. The shipments of fresh fruits from Sacramento this season have so far kept pace with those of last year, and up to the 22d. inst., had reached 4116 car loads.

* * *

TO AID BURBANK'S INVESTIGATIONS.

The Carnegie Institute has recognized the value of the labors of Luther Burbank and has come to his aid with the necessary means to make it more pleasant and at the same time furnish a wider scope for his efforts. Arrangements have been made to erect at Santa Rosa a large laboratory and experimental building from funds supplied by the Carnegie Institute. Two assistants will also be furnished Mr. Burbank for the prosecution of his work. Probably no one deserves such assistance more than Luther Burbank. He has worked along his chosen lines of plant breeding from a pure love of the science, and any emolument to be derived from his creations has been a secondary consideration with him. By his persistent efforts along one line of thought he has achieved a brilliant success, and while he has not acquired riches has made a name that is known the world over and honored wherever known. His reputation will live when names now reputed for mere wealth will be forgotten. It is not improbable that Andrew Carnegie may yet be remembered from his connection with Burbank's labors.

* * *

THE FRUIT WORKERS' UNION.

The labor problem has again forced itself on the fruit packers of Santa Clara county, where the Fruit Workers' Union has made demand on the packers. This union has recently been organized and the packers all over the state are watching it with a good deal of uneasy interest. The scale of wages as adopted is: For men and boys over 16 not less than 17½ cents per hour; boys 14 to 16, not less than 15 cents an hour; women and girls over 14, not less than 12½ cents per hour; children under 14, not less than 10 cents per hour. Men engaged in the more skillful labors to receive greater pay. This schedule was first presented to the manager of the California Fruit Canners' Association, who refused to concede it or to recognize the union. What the union will do in the matter is not known but it will probably try to enforce the scale. The increased wages is not the worst feature in cases of this kind, although these are sometimes placed so high that the employer cannot concede them without loss, but there are prospects for fresh demands, for sympathetic strikes and these are always engineered to take effect when the employer would suffer most from them. A strike at the present time, when we are in the height of the fruit packing season, would entail very heavy loss to grower and packer. It is not known what strength the union has, but if it has the strength to call out any considerable part of the fruit workers at the present time there will be much fruit wasted, especially in view of the fact that we are just at the commencement of the prune season.

RAISINS.

(Continued from first page)

in a room which can be closed tight or ventilated at will. After remaining in the boxes from fifteen to twenty days, the sweating process is completed and an even degree of curing is secured throughout the entire lot.

The sweat boxes are taken with the raisins to the packing tables and there the bunches are trimmed and packed for the market. A device invented by Mr. Blowers of Woodland is most generally used for packing. It consists of a metal tray just the size of the packing boxes and has a movable top. The bunches are placed on the bottom with the greater amount of stems up. When the bottom is so covered, the frame is filled till the weight is five pounds when the raisins are pressed gently to firm them, a sheet of paper is laid on top and a sheet of steel the exact width of the frame is placed on this and the whole thing turned over and placed in the box. The steel sheet is drawn out and the raisins drop in the box with the finished side up. The paper is folded over this and another layer is added. In all, four layers are used to make a standard sized box which weighs twenty pounds.

Loose grapes and inferior bunches are run through a stemmer and on through a grader which usually makes four grades. These are packed in boxes and sold as loose muscatels. A certain amount of these loose grapes is seeded by special machinery, and are used for various culinary purposes. The fourth grade of loose grapes produce seedless muscatels. These grapes are simply the small and undeveloped berries on the bunches.

The chief supply of seedless raisins (not seeded raisins) comes from the Seedless Sultana and Thompson's Seedless. The latter is fast taking the place of the Sultana in most places. It produces more to the vine and the berries are larger and better colored. The bunches are not so compact as those of Sultana and as a consequence, dry more rapidly. This grape is fast taking the place of the imported Zante currant which ordinarily does not produce well in this state. The seedless grapes are sometimes bleached with sulphur. This is a practice that will sooner or later injure the market for the seedless raisins from the sections where it is practiced. The "desert regions" of the south are fast coming to the front with these grapes and there they will dry stacked up in the shade in much shorter time than it is possible to do in the northern sections, spread out in the sun and the product is as fine in appearance as the bleached raisins and as good in flavor as the unbleached.

* * *

PRUNE TREES AND STRAWBERRIES.

Editor Cultivator: Will you please tell me through your paper if young prune trees planted this year are any the worse for having the leaves picked off by chickens, no leaves being left on and in some cases the branches being broken; are they stunted or damaged for future use?

Please give me the name of the best variety of strawberry for this county, being rather heavy soil with adobe bottom.—J. R. Brown, Santa Rosa.

It depends on what sort of growth your prune truees made before the chickens picked the leaves off. If they made a growth of a foot or more before the chicken picked them, they should come out all right next year. Of course if the trees have been injured very badly by having the branches broken, or the borers have entered the trunks or the sun has burned them in places, you had better pull them out and plant new ones. Trees that have made a good growth and then lost their leaves and a branch now and then but still have good healthy stems, will come out all right next year.

If they send out new growth and the chickens pick that off this year, they will not be worth much.

There is no way of telling which is the best strawberry for any particular section without trying them. One strawberry might do well at one place and a half a mile away prove to be very poor. We would suggest that you try several varieties. You will get berries from all of them and then you can select those which suit you best. We would suggest that you plant a dozen or more of the following: Brandywine, Dollar, Lady Thompson, Laxton's Noble, Hood River and Great Pacific.

* * *

GUM ON CITRUS STOCK.

Editor Cultivator: Do you know anything personally about the merits of Scott's wax for gum disease?

I would also like to know whether gum disease is transmitted by budding. I have noticed gum around the buds in my trees after the buds have been growing some weeks, and on nursery plants under the same conditions. It seems to me to be somewhat different from ordinary gum disease on large trees, softer and sticky, though occasionally very hard lumps will be found I have been told that this would disappear but do not know what to think

I have also noticed small red ants very active in the section where the gum appears. Whether they cause it or are there to feed on it are questions I would also like answered. Would it be best to destroy the ants with Paris green or something of that nature?—J. M. Jones, Riverside.

There are several receipts for disinfectants intended to cure gum disease on citrus trees, but we have had no personal experience with any of them. We know that growers around Pomona have met with good success by using the ordinary lime, sulphur and crude carbolic acid mixture. This is made by slacking equal weights of lime and sulphur in crude carbolic acid, using enough of the liquid to make the material into a paste when it is cold. This is applied to the trees as a whitewash, the affected parts being first scraped clean of the gum and diseased bark. The fact that the gum disease is so widely known in Southern California yields to antiseptic treatment, would indicate that it is a germ disease and therefore may be contagious. The smooth sticky gum that has been so frequently seen on nursery stock and young citrus trees during the past two or three years, appears to be different from the "scaley bark gum disease." It has been our observation that young trees affected with it do not recover. We have an orchard under our observation that was quite bad last year, about 25 per cent of the trees being affected a few months after they were planted. All of them died and a few still show the disease coming on. The orchard has been well cared for.

Plant pathologists have worked on the gum disease of plants for years, but have no definite knowledge of the subject that is of any practical value. A German scientist has grown cultures from gum that was taken from trees and produced the disease in healthy plants from it, but that is the most that has been done in that line.

It is not likely that ants have anything to with causing the disease; in all probability they are there to gather the gum when it arrives at a certain stage, though it might happen that they sometimes carry the germs from one place to another. If in any event the ants do eat the young growth, the injury can be readily deteced by examining it closely. The most effective way of getting rid of ants is to find their holes and destroy them there. Horned toads are the best ant killers that we have, and should never be disturbed. For rapid extermination of ants hot water is good when the ant den is close to plants or in the lawn. Bi-sulphide of carbon is also good, though we have had just as good success with boiling water.

* * *

CRACKING GRAPES.

Editor Cultivator: I would like to have you tell me why my Black Malvoise grapes crack open as soon as they begin to color. This is the second year they have borne. The soil is a good orange soil, perhaps a little heavy. They have had some water since setting, applied with a hose while watering other things. If this had been overdone, I would think it the reason. If cracking is characteristic of this grape I will dig them out as I have not had one good bunch yet.—Mrs. Ashenfelter, Covina.

The Black Malvoise cracks in all kinds of soils and whether irrigated or not some seasons. You are liable to lose your crop from cracking four years out of five. Our Black Malvoise are on very light sandy soil, have had no irrigation since mid-winter and still they crack. I would not dig them out, but would graft them over to Cinsaut and Trenthen Black. These two grapes are very similar to the kind you have and do not crack. They are just as good as Black Malvoise and one comes in just after the other. If you want scions of those varieties, drop a card to the Experiment Station, Ontario, and they will be saved for you. Call some time in January or send 10 cents in stamps and they will be mailed to you.

Be Sure and Get

Woodward's Adjustable Prop Bracket

The Only Bracket That Will Adjust Itself to Any Prop

They are cheaper than any other Prop Bracket that can be made, and will positively not get out of order. No nails or splice to break; no time spent in repairing; can be padded if you wish without nailing. Stand props as near the bottom of trees as possible and they will not be in the way of cultivation If the Bracket is sprung apart so as to go on partway of the Prop it will take a side hold and will never slip. If the Bracket should be too loose press the sides together so as to make a little friction on the sides of Prop and it will stay in place better while being put up.

Having reduced our price to $17 per thousand, we would be pleased to have a continuance of your patronage and can fill all orders promptly.

A day spent looking over our nursery will be money well invested

A. YARNELL,

Station K, LOS ANGELES, Cal.

PICKLING GREEN OLIVES.

Editor Cultivator: Can you or any of your subscribers give me a successful receipt for pickling green the large Sevillano olive; also what can you tell me about the true French Picholine and its successful handling?—Chas. D. Adams, Upland, Cal.

When olives are to be pickled green they must be picked before the flesh begins to soften. They must be a bright green and if the flesh begins to soften in the least, it indicates the presence of considerable oil. The bitterness must be extracted just as with ripe olives. This is done by placing them in a solution of lye, two ounces to one gallon of water. Change this solution once a day if it requires several days to remove the bitterness. It is best to keep a close watch on the fruit and see that it does not become over done or the lye does not penetrate too rapidly. This can be determined by cutting a few, the lye discoloring or changing the flesh of the olive to a lighter green. Try the lye on a few and if the lye act too rapidly, penetrating to the pit in 24 hours, change the lye every five or six hours until the change in color almost reaches the pit. There can be no definite time given for keeping the lye on them, as weather conditions determine this. If a damp foggy period precedes the picking time, they will cure in much less time than when picked just after a low humidity. After the bitterness is removed, or nearly so, rinse them in clear water until the lye is removed. The clear water should be changed at least twice each day. If a weak solution of brine is used from the beginning after the last batch of lye is used, there will be no danger of the olives softening. There is, however, little danger of that with green olives. After the lye is entirely removed, which can be determined by tasting, add a brine composed of four ounces of salt per gallon and allow it to remain on the olive for two days; add six ounces of salt per gallon to the next brine and allow that to remain on the olives for a week. At the end of that time, put into a brine of ten ounces of salt per gallon for two weeks. At the end of that time put into the final brine of 14 ounces of salt per gallon. If the brine is increased in strength gradually as directed, the olives will not shrink. In case some of them should shrink, by mistake in making the brine, take them out and soak in clear water until they are plump, changing the water twice a day during the process. When they fill out, put in brine in which they will barely sink. Increase the strength of the subsequent brines more slowly than before until the 14 ounces per gallon is reached.

In all cases great care must be observed in keeping the vessels in which the olives are being cured perfectly clean. All olives must be submerged entirely during the process. This is only possible by using weights. Cloth is spread over the olives and wooden floats the size of the vessel in which the olives are placed. The thickness or depth of the olives should not be over two feet, less being better. The lower part of the column of brine soon becomes the stongest, so the vessel should be provided with a faucet for drawing off the brine so that it may be poured back and thus equalizing its strength. No hardening material is necessary in curing green olives, brine being sufficient. It has been suggested at times to add a little alum for this purpose. This should not be done, as quantities so small that no detection is possible by taste, will be injurious to some people. It is sometimes used in certain stages of bread making. It is a misdemeanor to do so in some states and should be in all. There may be some people who will not be injured perceptibly by eating olives hardened by alum, but it should never be used for that purpose.

The French Picholine olive is one of the finest in quality, being rich in oil, having a very thin skin and growing to a very large size. It is used chiefly for making fancy pickles and can be used for making the Queen Olive. It is not a very heavy bearer with us, in fact we consider it out of the race on that point. It grows to a larger size in California than in Europe, averaging 104 to the pound there and 77 per pound here. It is much longer than thick, is thicker at the stem end and is curved. It is reddish black when ripe and comes in in midseason. It is sometimes confused with Lucques.

TIIE JOKE WAS ON PAPA.

It was a serious moment in the family. Helen Jennings was in tears and tried to speak, but her father stopped her with a sad gesture. Mrs. Jennings wiped her glasses and prepared to read a letter that she had found in Helen's pocket. To think that their Helen, who had but recently celebrated her seventeenth birthday, their Helen, who was so sweet and good and straightforward, should have a letter like this!

Mrs. Jennings read in a trembling voice:

"Angel of my existence—"

"What!" exclaimed Mr. Jennings, "What sensible man would dream of addressing a young girl in that idiotic manner? But go on, my dear."

"Existence spelt with an 'a', too," said Mrs. Jennings.

"Really, the idiot can't even spell!" exclaimed the justly indignant father. "But let us hear the next."

"It is impossible for me to describe the joy with which your presence has filled me."

"What does he try to describe it for, then, the ignoramus? But don't let me Interrupt you,'" groaned Mr. Jennings.

"I think of you constantly, and I bitterly condemn your father, the old party, who will, no doubt, withhold his consent to our union."

"Old party! ! Obstinate, unfeeling, purse-proud! And I have been the kindest of fathers. When I see this young man I will—the man that could pen those words—but go on, my dear."

"Theodore, there is some mistake; I did not see this overleaf till now," murmured Mrs. Jennings, softly.

"Eh? Let me see. Hem! "Yours, with all the love of my heart. Theodore—May 10, 1865.' Why, bless my soul, it's one of my own letters!"

"Yes, papa," said Helen, drying her tears, and taking advantage of the pause that at last gave her an opportunity to speak. "I found it in one of the trunks, and I was going to explain, only you would not let me say a word."—Epworth Herald.

A Cultivator representative writing from Escondido, San Diego county, says the hay and grain crop of that section is fine, in fact very much better than has been raised for years. Grapes and fruit abundant. The San Pasqual and Escondido dairies are running to their full capacity and their products find ready sale.

There is enough wine produced annually in California to float five battleships of the size of the Oregon.

One proof of the great diversity of California's industries is in the fact of the state receiving from the growing of garden and flower seeds between two and three million dollars annually. The biggest plantations of Central California have gone into raising seeds on a gigantic scale. For raising flower seeds alone there are 14,500 acres in Central California.

Somebody did a golden deed;
Somebody proved a friend in need;
Somebody sang a beautiful song;
Somebody smiled the whole day long;
Somebody thought, "'Tis sweet to live."
Somebody said, "I'm glad to give;"
Somebody fought a valiant fight;
Somebody lived to shield the right;
Was that somebody you?

—Success.

"Why ain't you at school, little boy?"

"I stayed away on account of sickness."

"Who is sick?"

"The truant officer."

BETTER ARSENICALS.

Prof. Geo. E. Colby of the University of California, in a recent bulletin on Paris green investigations says that the market is fast growing to be in a very fine condition as to the quality of Paris green. More and more is the poison offered coming up to the standard prescribed by law, especially those containing less than four per cent of "white arsenic."'

NEW SALAD PLANT.

The Saturday Evening Post is authority for the statement that the U. S. department of agriculture will soon introduce a Japanese salad plant called Udo. It describes the plant Udo as a plant that is very tender, combining the taste of celery, lettuce and pineapple. It is as crisp as the tenderest shoots of celery, but has no stringy fibers; when cut up it is white and emits a pleasant odor. It is abundant in the winter and for that reason will be greatly valued. After being planted, all the grower has to do is to cut his crop year after year for ten years, after which the field must be replanted. In Japan the shoots sell at a high price, frequently sixteen stalks sell for twenty-five cents.

SILK CULTURE.

From many sources the Cultivator is asked to give information regarding silk culture, the raising of the silk worms, mulberry trees, etc. This industry is one peculiarly adapted to California, and it seems to us that we only need men who understand the work to come here and establish the industry that the large number already interested would have some one to go to for the required information to make silk culture a success.

In a recent number of the Oakland Enquirer a Mr. H. A. Kelly, writing from Blowing Rock, N. C., urges the California Promotion committee to get in communication with Italian silk growers, who have made a great success in the work. He says that over $100,000,000 worth of silk was manufactured in the United States last year, all the raw silk being shipped in. California alone sould raise this raw product and thereby add another valuable industry for the benefit of its citizens.

AMERICAN POMOLOGICAL SOCIETY.

From the interest manifested among fruit growers throughout the country it is expected that the Boston meeting of this society will be the most largely attended session that has been held in many years. The leading State horticultural societies and similar organizations have appointed delegates to it and most of the important fruit growing sections of the country will be represented by leaders of horticultural thought and achievement in their respective localities.

The time of this meeting, which is the Twenty-eighth Biennial Session of the Society, has been fixed for September 10, 11 and 12.

The sessions will be held in the beautiful new horticultural hall of the Massachusetts Horticultural Society, where the fruit exhibit, which is a prominent feature of these meetings, will also be displayed.

NATIONAL FRUIT AND WINE EXPOSITION.

A Fruit and Wine and Allied Trades Exposition, the first ever held, will be given in the very center of New York City for the two weeks of January 18th to the 30th, 1904.

It will be held in the Herald Square exhibition hall, the largest permanent exhibition hall in the metropolis, having nearly seventy thousand square feet of floor space.

The purpose is to assemble the largest and a complete display of fruits and wines ever shown, and thus to increase the interest of the growers, packers, shippers, dealers, and buyers of the world and the consuming public generally in the wonderful strides made, especially in this country, in the development of these industries.

The fruit and wine interests of the Pacific Coast and the fruit interests of the South will be especially represented, as will all the allied trades connected with these industries.

BURBANK ON ROOT-PRUNING.

Every experienced nurseryman trims all the small side roots off his nursery stock before planting. This is a universal custom, and in my experiments I have found that seedlings and very young trees should always be treated in this way under all circumstances. A young seedling tree which has had its roots cut off to within a few inches of the collar, and the top almost wholly removed, will in all cases make a far better growth than the one planted with all its roots, even if the top should be removed. Of course it is necessary to remove the top in proportion to the amount of roots removed, and strange as it may seem, it is especially necessary to prune the roots short when they are to be planted on land that has little moisture near the surface. For the trees having many side roots divide their forces in starting in all directions, instead of making a good, substantial main tap root, which the closely pruned seedling will always proceed to do. Though of universal application, these facts are especially applicable to dry climates like California and Texas.—Luther Burbank in Rural New Yorker.

WHAT ALL SHOULD LEARN.

There is no study more attractive to children than botany. It deals with things they are familiar with, but know but little about. As soon as they begin to learn the relationship between races of plants, and the peculiarities of structure upon which that relationship is predicated, they begin to entertain new ideas of their old friends, the plants and trees, wild and cultivated, and when they learn that these plants are male and female, and that reproduction requires the influence of both sexes, and they learn the names and uses of the different parts of root, stems, branches, leaves, buds, flowers and fruit, an interest is kindled that causes a craving for more kowledge; how plants grow; how plants feed; formation of seeds; production of fruits; how soils are made; what soils contain; effects of sunlight, rains and frosts on vegetation; fertilizing soils; the uses for which crops are grown, all these grow naturally from botany. Botany leads by easy gradations into agricultural science. There is no place where the one ends and the other begins. Agriculture cannot be taught without botany, and botany cannot be fully taught without encroaching on the domain of agriculture. Every child in an agricultural country should be taught the elements of these twin sciences. When that is done, we will see school children become teachers of their parents. Parents will naturally take interest in that which their children are learning, and they will learn as fast as the children, and the more insight the parents acquire on these subjects the more they will become interested, and the more they will learn. Therefore botany and agricultural science ought to be taught in all our country schools, and no harm will be done if the same things are taught in all schools and to all pupils regardless of sex. Some of the best farmers in the country are women. We have never known an ordinarily intelligent woman to undertake farming and fail. In the future there will be many more women farmers, and they will succeed, because the determination which will inspire a woman to undertake farming will also insure success. Then let us have agricultural science taught in all schools, both theoretically and practically. Let all who favor this proposition says aye, and say it out loud.—Farm and Ranch.

The San Dimas Nurseries have an order for two carloads of orange trees for shipment to Johannesburg, South Africa. Mr. Teague has heretofore made some small shipments of orange trees to that country, but this is the first large order. The two cars will be sent on Express time to New York City, and connected there with the fastest steamers to South Africa.

The prune growers of the Toluca valley will have a crop of prunes estimated at between seven and eight hundred tons green. The two deciduous exchanges there will handle most of the crop.

Irrigation Notes

A FOREST POLICY.

With the intention of fixing upon a proper forest policy, California has undertaken this year, with the help of the Bureau of Forestry, a comprehensive and detailed study of its forests. The State legislature recently appropriated $15,000 for the study, the condition being that it should be carried out by the Bureau of Forestry, and that the Bureau should bear half the expense.

The State desires to know those facts about its forests that will guide it in passing wise forest laws. It desires to know, for instance, what disposal should be made of the State forest lands, what should be done to regulate the cutting of timber on them, how forest fires may best be restrained, whether tree-planting in denuded areas will pay, etc.

The work is now begun and it will require several years for its completion. Maps will be prepared, reforestation studied and the effects of fire and water sheds.

The Bureau will also make a study of the chaparral lands of Southern California in order to learn whether it will pay to plant them with timber trees. A very interesting question has been raised as to whether chaparral—which includes a great variety of scrub trees, such as manzanita, scrub oak, valley mahogany, and scrub cherry—will retain the moisture in the soil as well as timber trees. Chaparral grows denser than timber trees, and often reaches a height of 20 to 25 feet and a diameter of 16 to 18 inches. L. C. Miller, who has charge of this work, is now making a study of the conditions under which chaparral grows in the San Gabriel mountains, near Pasadena, where the Bureau has been planting pines and cedars for several years.

IRRIGATION EXHIBIT AT THE WORLD'S FAIR.

There will be an irrigation demonstration prepared by the government for exhibit at the St. Louis Exposition which will consist of at least three models. One of these will reproduce in miniature the Tonto storage dam, another will include a section of the box canyon below the dam, and the third, showing a typical irrigated area will be a close reproduction of Mesa City, Ariz., on a scale of about 20 inches to the mile. This model will show houses, farms, orchards and the canals and ditches with their headgates and power works. Mesa City is an ideal irrigation community. It was originally settled by thrifty Mormons, who took small holdings and made the utmost use of every acre. As the name indicates, the place is situated on a fertile tableland, and is about eighteen miles east of Phoenix, Arizona. The preparation of these models will be under the direct supervision of the Geological Survey, and an agent of the Survey is at present in the Salt River Valley gathering data from which the details of the construction will be made. It is expected that this exhibit will have not only a unique interest for the people of the eastern United States, but that it will still further convert them to a realization of the value of western irrigation in the development of the whole country.—Forestry and Irrigation.

Magnolia Avenue, Riverside.
Once a Sheep Ranch. Result of Irrigation.

AMOUNT OF WATER REQUIRED TO IRRIGATE AN ACRE.

A cubic foot per second flowing through an irrigation season of one hundred days will deliver about 200 acre-feet, or will cover 100 acres 2 feet in depth. In most localities this is sufficient water for the production of an average crop. In California, where water is scarce, less is used, and for orchards twice as large an area can be irrigated.

When irrigation is first practiced more water is needed to thoroughly wet the subsoil, but after a few years a less quantity is required, and in some localities, as at Fresno, California, no water is applied on the surface, the seepage from the canals keeping the fields sufficiently moist.

Two acre-feet for an acre is an average allowance for the arid region as a whole.

Five acres per miner's inch, or 250 acres per second-foot, may be taken as the most economical use, say at Riverside and Redlands; where ditches are lined, water is carefully measured, and citrus fruits are irrigated. This must be furnished about two hundred days on an average. It is equivalent to 1⅜ acre-feet of water per acre irrigated. This duty can be improved by the use of pipes.—Forestry and Irrigation.

STUDYING FOREST FIRE PROBLEM.

The Bureau of Forestry has this year undertaken a thorough study of the forest-fire problem in several different regions. It has placed men in forest districts to study fires while in process of burning.

The investigation is now in progress in Northern Florida and Southern Alabama and Georgia under direction of Ernest A. Sterling and H. J. Tompkins. Later in the season the fires of the Pacific Coast will be studied.—Forestry and Irrigation.

NATIONAL IRRIGATION CONGRESS.

On another page may be seen a communication from C. B. Boothe, regarding the National Irrigation Congress which will be held at Ogden September 15-18. It is very clear setting forth of the benefits of that meeting to the whole country and the advantages to each section to be fully represented there. To give a more definite idea of who may go as a regular delegate, we give the following as a basis upon which the official call announces that delegates may be sent:

The Governor of each state and territory to appoint twenty delegates.

The mayor of each city of less than 25,000 population, two delegates.

The mayor of each city of more than 25,000 population, four delegates.

Each board of county commissioners, two delegates.

Each Chamber of Commerce, Board of Trade, Commercial Club, or Real Estate Exchange, two delegates.

Each organized irrigation, agricultural or live stock association, two delegates.

Each society of engineers two delegates.

Each irrigation company, emigration society or agricultural college, and each college or university having chairs of hydraulic engineering or forestry, two delegates.

The Congress will convene at Ogden on September 15 and continue three days.

THE ART OF MILKING.

There is no branch of dairying which has received so little attention and close thinking, whether on the part of the dairyman himself, or the scientists who are investigating dairy subjects, as the important item of drawing the milk from the cow. In a general way, we all know that the manner of milking has much to do with the profitableness of cow keeping. We all know that there are good milkers and poor milkers, but just why one person is a good milker and another is a poor milker, it has been deemed impossible to determine, and still more impossible to describe.

As in so many other matters, it has remained for little Denmark to take up this subject in a careful, painstaking inquisitive way, and among other attempts to solve the milking problem, the Agricultural Society in the County of Svendborg, a couple of years ago, arranged a competition for writing a short and popular article about the work of milking. From among the manuscripts submitted, that of Mr. Jorg. Peterson, head master at the Agricultural College of Dalun at Tyen, got first prize, and some thousands of copies were printed for distribution in the little kingdom.

From a translation of this essay, for which we are indebted to one of our English exchanges, we select and condense as follows:

It is a general rule, appropriate to all living beings, that the use of an organ of the body promotes the development of that organ; this rule is thus also appropriate to the organ of the cow which we call the udder. The use of it is the milking, and in that we have the most important and best means of developing the udder of the cow, and at the same time also her milking power. But in order that the use of an organ may produce a higher development of it, it is also required that it will exert the organ. The exertion of the udder consist of milking it perfectly free from milk. The milker must take as an example the greedy calf, which sucks the very last drop out of the teat. This causes an increase of blood to the glands of the udder, and this is evidently of the greatest importance, knowing that it is from the blood all material for further development and for more milk is got. But, above all, is evident the importance of clean milking young cows or heifers, the udders of which are still growing and developing. What a good milker has to do, is not only to get out all the milk that is in the udder, but also to do that in such a manner that the cow feels it as an enjoyment, and further to take care no dirt or impurities get into the milk.

Before beginning milking, the milker ought to speak kindly to the cow, pat her and carressingly smooth her along the belly and the udder. The milk pail is then placed under the udder on a certain side of the cow, and he takes, with full hand, hold of two of the teats, one fore and one hind teat preferred. The hands are alternately moved upwards to the udder by a gentle pressure, and then, also alternately, slowly and lightly, closed downwards round the teat. These grasping movements are continued till he perceives the cow yields the milk, when the latter is got out of the udder in long, consistent streams ;the movements of the hands are the same as at the beginning, only a little more vigorous. For every new movement the hand must make a pressure up against the udder, and, at the same time, the thumb and forefinger shall seize the part of the udder which is next above the teat, in order to get as much milk as possible from the part where the milk reservoir is the largest.

During this part of the milking the conscientious milker must give all his attention to his work, for every interruption in it means loss of milk. All noise and loud conversation must, therefore be strongly forbidden during the milking, as disturbing to both cow and milker. When the first pair of teats no longer yield any milk, he proceeds in the same manner with the second pair. The milk must be squeezed, not pulled, from the teat. The latter must, therefore, as before mentioned, be taken in the whole hand, which must not more than is absolutely necessary glide along the teat. "Streak-milking," by which the upper part of the teat is squeezed between the thumb and the forefinger, or, worse still, between the fore-finger and the middle finger, and then the fingers tightly pressed, drawn downwards, is very objectionable. It is disagreeable to the cow, irritates the skin of the teat, and may easily cause sores; but not only that, it may even cause bursting of the mucous membrane of the milk-cistern and thereby cause a serious illness in the udder. A hard-handed milking often causes perturbations in the secretion of milk; in that way a cow may, for instance, become hard milked; a teat may from the same cause, easily be made quite useless, and a cow become what is called three-quartered.

But milking the cow is not yet completed. An effective after-milking must take place, by which the milker by means of suitable manipulations must work and knead the udder to press the last drops of milk out of the teats. A great many examples could be told about the influence of clean-milking upon the quantity of both milk and butter. In Germany the experiment has been tried of allowing one person to milk five cows during fourteen days, and then another person milk the same cows during the following fourteen days. The cows were fed and served during the whole time in quite the same way. The result, however, was that the second person on an average got about 2 kilograms (4 lbs. 6½ oz.) more milk per animal per day than the first one. At a similar experiment made in America by Prof. Babcock, in Wisconsin, three cows were milked during a week by one person A; the following by another person, B. From the milk A received during this week 11.8 kilograms butter was churned, while from the milk B got only 9.8 kilograms butter was produced, a difference thus of 2 kilograms.

This result is not only owing to the greater quantity of milk received, but, more still, to the fact that the last drawn milk is by far the richest. That this is the case anybody might easily ascertain for himself by pouring the very first and the very last drops of milk from the same teat into cream tubes. When comparing the tubes after the cream has risen, he will be surprised at the great difference in the thickness of the layers of cream; the milk first drawn looks, judging from the layer of cream, like good skimmed milk, the last milk drawn is more like thin cream. Through an experiment tried at an agricultural school in Denmark, it was found that the first streams of milk contained only 0.06 per cent of fat, while the last strippings contained as much as 10.2 per cent of fat.

A thoroughly clean milking, therefore, is very important, not only as a means of developing the milking power of the cow, but also to produce richer milk. And the milker who does not give himself time thoroughly to milk the cow clean, either does not understand his duty or does not care to carry out his work conscientiously. It is important also how often the cow is milked daily. Some experiments concerning this question have also been tried, which show that the more times a day the cow is milked the more and richer the milk she yields. But whether one milks three times or only twice a day, the intervals between the milkings must, as far as possible, be of the same length. The cow is in a very high degree dependent on habit, and her udder works even and regularly. The milking hours, therefore, must be

WANTED
A young man who is a good milker and experienced in caring for cows, to take charge of our small herd of Jerseys. A good opportunity for a man who desires to add scientific knowledge of feeding and management to practical experience. Good wages to the right man. Address, with references,
C. W. Leffingwell, Jr., Whittier, Cal.

carefully observed, and the same persons must every time, in the same course, milk the same animal. If the milking is begun too late, the cow becomes uneasy, and the tension of the udder causes pain to the animal—in both cases loss of milk ensues. The fact that the quantity of milk is lessened by milking less frequently and less energetically is a thing of which one avails one's self when wanting to dry a cow. But even in this case it is a bad plan to clean strip the udder; it is by far preferable to milk less often, finally only once every other day, every third day, or more seldom still, till the cow gives so little milk that the milking might be dispensed with altogether. During the biestings period is must be considered not only wrong, but even dangerous often, and hard to milk such cows which show any disposition for milk fever. According to examinations made by a famous Danish veterinary surgeon, this disease is caused by an increased activity in the udder, which must be considered still further increased by energetic milking. But for these two periods, when the cow is being dried and when she gives biestings (first milk), she can scarcely be milked too hard (that is too often and too energetically).

The milker must pay great attention to the cleanly condition of the udder and the teats. If he observes knots or tenderness in the udder, sores on the teats, the milk canal stopped up, or the milk having an unnatural appearance, etc., he must at once tell the foreman. Disease in udders and teats often being contagious, cows in that way infected must always be milked the last, and the milk from the affected part of the udder be put into a special vessel and destroyed, in order to hinder further spreading of the infection. The milk canal in the teat is sometimes very tight (the cow being what is called hard-milked) or often shows an inclination to get stopped up.

To use a straw, or such like, to widen and "cleanse" the canal is very bad policy, because in that way inflammation of the corresponding part of the udder might easily follow. A teat which has a stopped milk canal must first carefully be worked or kneaded between the palms of the hands, and then carefully milked clean. A heifer is often sensitive for the milking manipulation, and this sensitiveness will sometimes last until she gets older; in this case the milker must be still more kind and careful at the milking; and means of restraint or force must be used only in case of great necessity.—Hoard's Dairyman.

THE ANGORA GOAT.

The Angora goat industry on the Pacific Coast is growing steadily, especially in Oregon is the number rapidly increasing. Regarding Angora goats, G. F. Thompson, Clerk of the Bureau of Animal Industry at Washington, says:

"A large class of people in some way have become possessed of the opinion that the goat is practically a useless animal. They do not reach conclusions upon investigations, however, and do not discriminate between the different breeds. To them a goat is a "goat," and there the argument ends. Investigations prove that the Angora goats are not only classed among the most useful of the domestic animals, and have been so classed for thousands of years, but their usefulness is manifested in a variety of ways. The fleece, called "mohair," furnishes some of the finest of fabrics among ladies' goods and is used in various other manufactures; their habit of browsing enables the farmer in a wooded locality to use them to help in subjugating the forest; their flesh is exceedingly delicate and nutritious; the milk, though not so abundant as with the milk breed of goats, is richer than cow's milk; their tanned skins, though inferior in quality to the skins of the common goat, are used for leather; their pelts make the neatest of rugs and robes; they are excellent pets for children; a few of them in a flock of sheep are a protection from wolves and dogs; their manure is noticeably helpful to the grass which follows them after they have cleaned away the underbrush."

The best localities for the Angora goat seem to be on high ground where they will not be subject to foot rot. Wet or marshy ground is not at all suitable.

Goats require a great amount of exercise. They are a great browser and are sensitive of restraint. They can withstand great cold provided their wool is kept dry, but let them become exposed to cold rain or sleet and they will die off easily.

They are an economical animal to keep owing to their fondness for leaves and twigs, but they also reqquire other feed, such as oats, straw and fodder. In Texas they do well when fed on cotton seed. Care must be exercised to be sure they have plenty of salt. The best way is to have rock salt in boxes of easy access; there is no danger of their eating too much of it.

The products of the Angora goat are its wool, its milk, its flesh and its manure. So far the market for good mohair has been good and prospects are that the demand will continue indefinitely. A practically pure bred goat will shear from three to five pounds, which is worth from 30 to 40 cents. In cold countries goats are sheared only in the spring, but in climates like California they may be sheared twice a year.

The milk of the Angora ewe is uncertain in quantity, usually much less than that of the short hair breeds. It is particularly good for infants and is practically immune to tuberculosis.

The meat of the goat usually passes in the market as mutton from sheep. So far the prejudice against goat mutton has caused it to sell in the live stock markets at about a half cent per pound under sheep. The packers buy them as goats and sell them as sheep in the form of dressed meat or canned.

Goat manure sells at a good price as a fertilizer, it having special properties beneficial to fruit trees and lawns.

Regarding the building up of a flock Mr. Thompson says:

"It is assumed that whoever goes into the business of raising Angora goats does so for the production of mohair, rather than meat or skins, and so it is to his interest to have a flock that will yield a profit from the beginning. The best flock for this purpose is one composed of thoroughbreds. Such a flock will yield good mohair from the first. Those who enter upon the business of goat raising, however, must make their operations conform to their capital, the same as in any other business. They will find that desirable does will cost from $5 to $12 each, and bucks all the way from $50 to $100 each; so that a large herd of this kind, although preferable, will cost a small fortune, and is beyond consideration by most people who will engage in the industry."

There are three registration associations in the United States, one at Kansas City, one at Salem, Oregon, and The Bailey Angora Goat Association of San Jose, Cal., have kept a record for years.

BLINDERS.

Blinders were invented by an English gentleman to conceal the diseased eye of a valuable horse, and as a coat-of-arms could be placed on them others followed his example. They are never used in Russia and a shying horse is almost unknown there.

YOU SHOULD DISCARD BLINDERS

1. Because unsightly. The beautiful eye of the horse is exchanged for a piece of leather.
2. Because they are a cruelty to the horse. All animals enjoy the use of their eyes.
3. Because they frequently injure the eye-balls by pressure, and when out of order by flapping against them. When close to the head, also, the nerves irritated, causes inflammation.
4. Because animals are often terrified by what they see imperfectly, or hear and do not see.
5. Because veterinarians discovered long ago that "blinders" are a common cause of disease of the eyes. Cavalry, police and fire department horses have no blinders.—Our Dumb Animals.

Before retiring from office General Nelson A. Miles issued an order to prevent the docking of horses. This was one of the last orders issued by this general, and one for which he should have the thanks of all people. No more beautiful horse exists than one with a long, natural, flowing tail.

The man at his work! There is nothing finer. I have seen men uncouth, homely and awkward when "dressed up" who were superb when at work.—The Philistine.

TO FARMERS, STOOKMEN, DAIRYMEN:

SUGAR BEET PULP
(Kow-Sauer-Kraut)
also **MOLASSES**
FOR SALE

"KOW-SAUER-KRAUT" 50 cents per ton F. O. B. cars fresh from factory. Conceded to be the cheapest and best dairy food in California. Write for freight rate if too far to haul.

MOLASSES, 75 cents per barrel. Consists almost entirely of carbohydrates. (sugars) cheapest and best food for fattening stock of all kinds. Send for testimonials regarding feeding value of molasses for **working horses, fattening cattle** and **growing pigs** and **calves.**

The Louisiana Planter says: "It has been proved conclusively a pound of molasses has a feeding value about equal to that of a pound of corn."

Los Alamitos Sugar Co., Los Alamitos, Cal.

SLEEPY HOLLOW HERD OF HOLSTEIN CATTLE

We have just received from the Eastern States two carloads of officially tested cows. This has overcrowded us for the present, and to make room we are offering some excellent young cows for sale. They are all in calf to our great herd bulls, and right now are in fine condition to ship. For full particulars write

R. M. HOTALING
Rialto Building San Francisco, Cal.

1,200,000
U. S. CREAM SEPARATORS

This seems a great number of separators. Does it not? It is a great number, but these figures are as easy to make as smaller ones—and, as our "would-be competitors" make their figures

400,000

and we sell three separators to their one, the reader can see our figures are within the FACTS—

POUGHKEEPSIE, N. Y., March 1, 1902.

Fifteen years ago last October we started our creamery on the co-operative plan recommended by your agent, fitting the building with machinery from your Company, and using the Cooley Creamers for the patrons. We have run on this same plan for all these years until Sept. 1899, when we put in separators. Our patrons are using more than three to one of the U. S. Separators over all other makes, and we believe the U. S. Separator to be the best on the market

We are still working the cream gathering plan, and believe it to be the best for the rural districts, where unavoidably some of the patrons are a long distance from the creamery. We are satisfied with it, because we believe it to be the best and the cheapest. No farmer can afford to hitch up and carry his own milk, even if he live within half a mile of the creamery, if he can get it done, as we have this year, **at the average cost to each patron per day of 9 cents, and some years for less.**

H. R. HOYT, President La Grange Creamery.

Bear in mind that the main factory of the De Laval Co. is at Poughkeepsie, and that that company boasted that no other separator could be sold in their county.

Send for illustrated circulars.

For Western Customers, we transfer our separators from Chicago, La Crosse, Minneapolis, Sioux City, and Omaha. Address all letters to Bellows Falls, Vt.

Vermont Farm Machine Co., Bellows Falls, Vt.

SHORTHORNS.

John Lynch of Petaluma is one of the enthusiasts on the dual purpose cow. A cow valuable for dairy purposes also of good proportion and build for beef as well. We give on this page a couple of illustrations of Mr. Lynch's stock. Wildwood is one of his prize-milkers and Orrick is at the head of his herd. Regarding the points to be looked for in the Shorthorn, Mr. Lynch

Orrick, 183,987

says: "For a milker, select a light red color, with red and white markings. Roan or light colors generally prove greater milkers than the deep red. Soft yellow skin, silky hair, fine tail, prominent eyes, are points which must be looked after.

There has been steady improvement

Wildwood, a Typical Dairy Shorthorn.

in the shorthorn cow for years and it is today a better milk breed and a better beef breed than when it was first imported from England. Regarding the claims for his favorite breed Mr. Lynch says:

"It would be highly questionable to claim that the best type of a beef animal would serve well for the dairy, but any reasonable man must admit that by breeding and cross breeding for twenty-five years along dairy lines, a type of animal may be developed that can be justly called the milk strain or dairy type of shorthorn."

DO CATLE HAVE HOLLOW HORN?

A subscriber writes the Tribune and inquires if it is true, as he has often heard, that cattle have the hollow horn.

It is true, and the size of the hollow in the horn generally depends upon the age of the animal. In young calves there is no hollow, but by the time the animal is a year old the hollow appears and in old cattle it is quite large.

The above answers the question as to fact, but we surmise that subscriber wanted to know if there was a disease called hollow horn; that is, do cattle get sick, the cause being hollow horn. To that we answer most emphatically no. When we were boys on the farm, in the springtime when the cattle were thin and run down on account of short feed, the old farmers would say that they had the hollow horn and the remedy was to bore a small hole in the horn and put a tablespoonful of spirits of turpentine in the horn. In boring the hole, when the gimlet or small bit would go through the shell and drop into the cavity, they would exclaim: "We were right; it was the hollow horn," and, in fact, they were right, for the animal did have a hollow in the horn. The animal being sick, as they thought, needed extra feed and care, and getting it, soon commenced to pick up naturally and they thought they had cured the disease.

Many persons did not know that cattle's horns were hollow until they had seen a lot that had been taken off by the dehorner. The disease among cattle—hollow horn—has gone where many other things have gone that were once considered true. We never hear of it now except as a relic of past ignorance. No worker on the diseases of cattle, unless he be an ancient one, ever mentions the subject, except to declare that there never was any such disease.—Farmers' Tribune.

HORSE NOTES.

The writer never found anything better for sprains and bruises than strong vinegar and salt, brought to the boiling point and applied as hot as the horse will permit. It is a good plan to first wrap cloths, soaked in hot water, around the injured place so as to steam and foment it well and then apply the hot vinegar and salt. The same treatment is one of the best for the same injuries in the human family, and where the sprain is very painful it will relieve in a very short time.

Horses should be watered with regularity, as it is as essential to them as grain when you want to put flesh on them.

A good poultice for a bruise or sore on a horse is made from ground flaxseed, ground slippery elm bark and new milk—equal parts.

How often one sees a horse wearing a bridle that does not fit; it is either too long or too short; if too long the bit drops down in the horse's mouth and constantly annoys him; if too short it is constantly drawing up the mouth and is a source of not only annoyance to him but often of great pain. A horse cannot work with any degree of comfort if the bridle does not fit, and the same is true of the collar. Adjust all parts of the harness so they will fit nicely if you want the horse to work with ease and be contented.

Many horses' shoulders are ruined because the collars do not fit properly. Sweney, sore shoulders, sore neck, etc., are generally caused by the collar not fitting the horse. A collar should fit snugly, and when it has been fitted by use to the shoulders of a horse it should not be used temporarily on another horse. Such use changes its shape and it will not fit the horse when it is again used on him.

The hames have much to do in making the collar fit and they shoud be carefully fitted to the collar and shoulders of the horse. The hames should be neither too long nor too short; they should be neither too wide nor too narrow at the top of the collar, and the same is true of the bottom. They should be fitted so the weight of the pulling would not come too high up on the shoulder nor too low down on the point of the shoulder. See that the hames fit properly if you want the horse to work with ease and have good, sound shoulders.

The writer, when he purchased a new collar, carefully fitted it to the neck and shoulders of the horse that was to use it; then took it off and soaked it thoroughly in water; put it on and drew it up close to the neck with the hames and put the horse to work. The collar being soft and pliable will soon fit the horse exactly and when it gets dry will remain so. A good fitting collar is as easy and comfortable to the horse as a close, easy fitting pair of shoes is to the human wearer.

More collars are worn too wide than too narrow, and as a rule are too long than too short. Be as particular in fitting the collar to the horse as you are in getting a pair of shoes to fit you.—Ex.

SOLOMON ON FARMING.

"Day unto day uttereth speech and night unto night sheweth knowledge." Thus wrote the Psalmist several thousand years ago. Probably he did not have in mind the problem of dairy farming, but his words apply there as well as elsewhere.

The business of keping cows is full of speech, if those who follow it have ears that are willing to listen; and it abounds in knowledge, if they will but seek for it.

How clearly Solomon understood the value of intelligence as a factor in successful farming, for he says in Proverbs: "I went by the field of the slothful, and by the vineyard of the man void of understanding and lo, it was all grown over with thorns, and nettles had covered the face thereof, and the stone wall thereof was broken down."

A more graphic description of shiftless farming has never been given.—Hoard's Dairyman.

INCREASED INTEREST IN STOCK.

It is gratifying to note the increase of the interest in the raising of stock in this state. Originally it was the only industry. Later came the development of mining and the grain, then the fruit industry. All the time vast quantities of dairy, meat and poultry products have been shipped to this state from the Middle West. Within the past few years this situation, and the fact that the great possibility of development were lying dormant has begun to be changed. The development up to this time is only a forerunner of that which the next few years will see.

The long-headed stock breeder who is preparing to meet the demand and take advantage of it will secure a fine strain of pure-bred stock. In the meat breeds, pure-bred stock, either cattle, swine, or sheep, will dress from 30 to 50 per cent more a year old and will dress much more also in proportion to their live weight than the common stock, and even the graded stock from pure-bred sires will take on an added value for market.

In the matter of poultry and eggs alone this state imports from two to three million dollars each year. And California has a climate in which chickens may be raised the year around.

DAIRY AND STOCK NOTES.

Courtland, Sacramento county, has many serious cases of anthrax.

* * *

Preliminary steps have been taken for a co-operative creamery at Yuma.

* * *

The Isleton Creamery is making from 1400 to 2000 pounds of butter daily.

* * *

A dairy company has been incorporated in Alameda county with a capital stock of $50,000.

* * *

The English Jersey Cattle Society have issued "Jersey Cattle, their Feeding and Management."

* * *

R. W. Davis of the Gardena Creamery, is putting in a large combined Disbrow churn, with a capacity of 800 lbs.

* * *

The Polled Hereford Breeders' Association is among the associations making appropriations for special prizes at the St. Louis show next year.

* * *

The Co-operative Dairymen, of Kings county, have contracted with the Sunset Cream and Butter Company, San Francisco, to sell their butter fat. The company is to pay for the fat at the rate of 1½ cents above the Examiner's quotations for butter.

* * *

. There is much waste stuff on the farm that can be turned into pork and made a source of income instead of going to waste, if the farmer so chooses. More than that, if his swine are of the breeds that mature early and grow to good weight in six or eight months, he makes a double profit from them as compared with the "razor-back."

* * *

The average California farmer does not seem to appreciate the value of a few sheep on the farm. In the East almost every farmer has a few sheep that supply him with mutton and spring lamb for his table, and perhaps some for the butcher, as well as a few pounds of wool to sell. He hardly misses the amount it takes to feed them, as they forage on much waste material that other stock do not eat. two or three well-bred ewes, the cost of which is not great, will in two years by their increase repay the cost of an extra board or wire on the bottom of the fence around the field and will add much in future years to his table, to say nothing of the income from their wool. There are but few farms in the state where a few well-bred mutton sheep would not add to the profit side of the ledger, and the State Fair is the place to go in order to study the varieties and select the most profitable.

* * *

C. H. Sessions, who has for several years supplied information for the Dairy Department of the Cultivator, has just returned from an extended trip through England, Germany, France and Italy. He reports a magnificent trip, is completely rested, together with some little information along the stock line which he has picked up on the trip. He is yet too fresh from the trip for us to gather from him any extended information before we go to press, but we hope later to give some of his impressions of the country which he visited. Yesterday morning at the Belle-Vernon Farms Company he was busy looking after the magnificent appointments of that institution which have been installed in his absence by his partner, Geo. E. Platt. While there are larger plants of this kind in the country, there are none more complete and better fitted for the handling of milk for city trade than this is. While some of the work has been carried on there for several weeks the plant is not fully complete yet. When it is the Cultivator hopes to give something of an idea of how milk is handled in this institution.

* * *

While the Jersey Association of Southern California is not represented by any of its stock in the State Fair, its president, Guy H. Miller, and treasurer, Geo. H. Thomas, are on the fair grounds this week to investigate stock conditions in general in the northern end of the state. They will visit some of the dairy sections near Modesto, Jacinto, and other places with possible reference to securing cheaper lands for dairying than can be had in Southern California.

* * *

The Jersey Breeders' Association of Southern California is still hoping to pull off a fall fair and butterfat test, but the committee in charge find two very serious obstacles in the way of inauguration, to make it sufficiently sure at this moment to say that it will be held. The two objections are the want of sufficient funds and sufficient time on the part of a few energetic people to push the preliminary arrangements. Chairman Platt of the committee is still in hopes that more interest will yet be taken, and by October 1st the arrangements completed that an exhibition may be made which will give greater impetus to the Jersey interests in this section of the state. It surely will be a mistake to drop matters at this time for this dairy breed in Southern California seems to be the leading favorite. However the Holstein people are not idle and this coast has some of the finest stock of that breed the world has ever produced, so our Jersey people had better watch out and not go to sleep on their laurels.

The Point Arena Creamery is a co-operative institution and since its organization has paid every year 18 per cent upon the stock. This concern has all the latest improved machinery, which handles the milk of twenty-seven patrons, who own 650 cows. The price which the concern has netted to the growers has been 25 cents per pound for butter fat. The milk averages four per cent of butter fat. The gross amount of butter produced in January was 3,912 pounds, February, 7352 pounds, March, 15,096 pounds, April, 19,020 pounds, May 21,634 pounds, June 19,674, and July 14,968 pounds. The rate per hundred pounds of milk ranges from $.96 to $1.20.

THE WORLD'S FAIR COW DEMONSTRATION.

The cow demonstration proposed as one feature of the World's Fair cattle exhibits at St. Louis next year has been definitely arranged, and on a much broader scale than anything of the sort heretofore attempted. It has been designated as a "cow demonstration" because, while not in any way neglecting the dairy test idea developed at former world's fairs, it is intended to illustrate in a comprehensive way the practical adaptabilities of the pure-bred cow. The strictly dairy breeds are given opportunities to make a large showing, while features not in the least conflicting with their privileges enable the dual-purpose breeds to demonstrate their value for both dairying and beef production. This means a demonstration rather than a competitive test, and will enable each breed participating to show its own peculiar advantages.

The Jersey, Short-horn, Brown Swiss and French Canadian associations have already entered. Entries will be permitted from individuals on behalf of other breeds if received before December 1. Prizes will be awarded to herds and to individual cows, and entries of from five to twenty-five cows may be made by representatives of any one breed. The same cows may compete for herd and individual prizes.

The tests will continue one hundred days, beginning Monday, May 16, 1904, and will be conducted in four classes, designated as Tests A, B, C, and D. Test A is for the demonstration of the economic production of butterfat and butter; B, of milk for all purposes related to dairying; C, of all the products of the cow, and D, for demonstrating the greatest net profit in producing market milk. In Class C the calf will be judged for its beef merits. A cow may be entered in more than one class.

Copies of the rules may be had by applying to F. D. Coburn, Chief of Department of Live Stock, World's Fair, St. Louis, Mo.

* * * *

The dates for exhibition of live stock in the several divisions will be as follows: Horses, asses and mules, Monday, August 22, to Saturday, September 3, 1904, inclusive. Cattle, Monday, September 12, to Saturday, September 24, inclusive. Sheep and swine, Monday, October 3, to Saturday, October 15, inclusive. Poultry and dogs, Monday, October 24, to Saturday, November 5, inclusive.

LOOSE MUSCLE.

Editor Cultivator:—I have a cow which looses milk from its teats after three o'clock in the afternoon. Will you kindly inform me would there be any gain in milking three times a day. Is there any possibility of its injuring the cow?—R. A. G., Petaluma.

Yes, the cow should be milked three times per day. When dried off, a permanent cure may be effected possibly by making a few light cuts in the opening of the teats, which in healing will contract the sphincter muscle to an extent sufficient to retain the flow till the regular milking.

GREASY BUTTER.

Editor Cultivator: I have a fresh cow of the Jersey variety. Have no trouble whatever in making the butter come (about five minutes) and by the free use of ice works nicely the first time. My trouble commences at the second working. Although I keep it in the refrigerator, as soon as I commence working it the second time it begins to get greasy and mushy and in a short time becomes the consistency of gravy. Can you suggest a remedy that will help me in making good firm butter from this particular cow's milk. She is such a good cow in every other particular that I am loth to part with her.—C. H. A., Ontario.

This query was referred to C. S. Burgess, the veteran butter maker of Riverside. In reply he says:

The trouble is caused by churning at too high a temperature. If C. H. A. will see that the cream is not above 60, lower would be preferable, say 58 degrees, fininshing at 60 degrees, washing water 58 degrees. No one can churn in five minutes and make fine butter, as in churning so warm the butter granules are broken up, thus causing the soft greasy condition of C. H. A.'s butter at second working. Then, again, it is not necessary at all to work butter the second time, as of old. If the work is properly done, if the cream is ripened up as it should be and churned as above directed, it will come in granules about the size of rice kernels. At this stage should stop churning and draw off buttermilk, draining it out well, then add rinsing water, which should be churned say half a minute, so as to thoroughly wash the butter—should use as large a quantity of water as of clear churned butter-milk drawn off (water should be about 2 degrees colder than buttermilk); draw this off, add salt and work. Do not work too much; just enough to thoroughly incorporate the salt, so as to not leave mottles or streaks. Never attempt to work butter when it is soft. If you pride yourself as a buttermaker, never let your butter get in that condition. If you must work twice, let the first working be just enough to distribute salt among the granules of butter, let stand long enough for salt to dissolve, then work—in the meanwhile should be kept at a temperature of 58 or 60 degrees. All my instructions are for summer buttermaking—warm weather.

If I knew what sort of an apparatus C. H. A. has for making butter I could give instructions in accordance. I separate a heavy cream—40 to 45 per cent of butter fat, ripen up and churn at 53 to 55 degrees, a thinner cream it would be necessary to churn at a higher temperature. One should never churn in less time than thirty to forty-five minutes to churn exhaustively—to get all the butter and make gilt-edged article. Kind and quality of food fed to cows has something to do with color, firmness and quality of butter, yes, and I may truthfully say the breed as well has an important part. Will perhaps write some more at another time. C. S. BURGESS.

The eleven fastest trotters are Cresceus, 2.02¼; Lou Dillon, 2.02¾; The Abbott, 2.03¼; Alix, 2.03¾; Nancy Hanks, 2.04; Major Delmar, 2.04; Azote, 2.04¾; Directum, 2.05¼; John A. McKerron, 2.05¼; Lord Derby, 2.05¾; The Monk, 2.05¾. No other blood but the Messenger, coming through his great grandsons Hambletonian and Mambrino Chief, has produced this extreme speed in the trotter.

THINGS TO KNOW.

Linseed meal will brighten the plumage of the fowls; it is also a correction for indigestion, and will often promote laying. Given twice or three times a week, a teaspoonful to each hen, in the soft food, it answers the purposes of medicine. For drooping and moulty hens it is excellent.

For worms give a few drops of turpentine, and next day a small dose of jalap.

Iron in any shape is good for the fowls. A little copperas (sulphate of iron) added to the drinking water, or ground fine and mixed with the food, is an excellent tonic, and will soon effect a healthy appearance in the fowls. An old iron pot makes a good drinking vessel on account of the iron rust it throws off. Iron filings or iron cinders placed in the drinking-water will afford iron to the poultry.

Copperas is one of the best disinfectants for the manure compost and for the fowlhouse. It will at once suppress the offensive smell.

Green food of some sort is a necessity to poultry.

Pound up the bones for the hens; there is nothing they relish more. Place the bones in the oven, or lay them on the hot coals, let them dry thoroughly, and then they can be pounded small with a hammer.

Burnt bones are also good. Let them burn till they will crumble when pounded, then break them up lightly and the fowls will eat them greedily. In this way they get charcoal as well as good grit.

A dust bath is just as necessary for the hen as another sort of bath is to human bipeds. Make a box 3 feet square, or larger if required, and about 6 or 8 inches deep. Fill with dry dust or wood ashes, or the two mixed; place under a shed or house away from chance of wet, and where the fowls can get to it easily. Renew every week or two.

Maize should never be fed in this climate, except for an odd week or two.

When cleaning out the fowl houses do not leave the sweepings where the hens can get at them and scratch them about. Burn everything to get rid of the vermin, or else take it all to the compost heap.

Profits in the poultry-yard hinge not on breeds and varieties, but on birds. Breeds have certain characteristics, but it is the individual which pays or fails. The poultry-keeper will do well to take notice of each bird and its performances, and not rely on the fact of their being of this or that breed.

The most common cause of failure in poultry-farming are over feeding, impure water in fowl dishes, poor ventilation in the houses, filth and vermin—the result of neglect in cleaning out the pens and the houses. Worst of all, indiscriminate in-and-in breeding.

Early feeding is a necessity if the fowls are expected to do their best. Where it is impossible to feed the young stock shortly after sunrise, it is a good plan to leave some grain over night, so they can get it themselves first thing in the morning.

Give the fowls fresh water twice a day, and during the hot weather see that the water tin is well shaded. Sun-heated water is often the cause of much disease. Enteric disease is frequently caused by it.

Give the moulting hens a few handfuls of hemp seed now and then; it will help to loosen the old feathers.

Crossing should always be done with intelligence and for a purpose—flesh value, or, in the fancier's case, feather, size, shape.

Where egg production is the motive, it is more a mating of individual birds which have proved themselves good layers than it is the crossing of two varieties.

POULTRY EXPERT'S PLAN.

There are so many different methods of feeding hens that no one can say positively which is best and prove it. Much depends upon the use to which the stock is to be put. If it is merely desired to get a large number of eggs, and get them steadily, heavy meat feeding is probably best. Animal matter in some form is essential. It may be supplied through the medium of cut bone or in beef scraps. Either is good, but it is much harder to prepare the bone. The best quality of ground beef scraps sells at from $35 to $40 per ton, and is ready to use without any work or trouble. On the average we think it gives quite as good results as the bone at a less cost time counted. Such meat as is fed is generally mixed with corn meal bran and other ground grains. The proportions are selected to suit the fancy of individual feeders. We prepare a mixture of about three parts wheat bran one part ground oats one part corn meal one part beef scrap. To this mixture add one-fifth in bulk of sweet cut clover (alfalfa), salt slightly and moisten to a crumbly consistency with hot water in winter and cold in summer. We feed all the birds will eat once a day. The same ration is good for growing chickens. The soft food may be given at any time of the day, but experience has led us to use it at noontime or night in the winter, and in the morning during warm weather. If fed the first thing in cool weather the birds get down off the perch, fill up and stagnate till the digestion is well over. On the other hand, when given a feed of fine dry grains they go to work and get exercise and breakfast at the same time. Again, it gives the feeder more time later in the day. It takes much longer to properly feed soft than hard foods, and work in the morning is usually more pressing than later in the day.

All grains are fed in litter of some kind—hay, straw, leaves, or any clean substance that will make the birds scratch and hunt for the seeds and bits of grain.

Heavy feeding is best. We believe in hard feeding, and never let the fowls go hungry if we want lots of eggs. Market birds, or those making market eggs, should be forced all the time, and when they no longer lay turned off and others put in their places. Animal matter and lots of it is the key to successful egg production. Of course the stock must be natural egg producers to get the best profits. All kinds of grain may be fed; cracked corn, wheat and oats are best. Corn is a good egg food; and, if the soft food is made up largely of wheat bran and oats, little other hard food need be used.

Ground oyster shell and clear grit of some kind should be within reach at all times. Good gravel will answer as well as more expensive materials. Clean, pure water is necessary, and it should be fairly warm in winter and cold in summer. Any kind of vessels may be used to hold it, and should always be kept sweet and clean.

Don't fuss too much over the feeding; simply give the right kind of birds lots of it, and they will do the rest.

These few suggestions apply only to our breeds. Not all birds will stand such "advanced" work.

If the eggs are to be used for hatching, don't force so hard. Let the pullets mature slowly. Give them lots of exercise and range and let the eggs come along more naturally and not so early in winter. Generally hard, persistent winter laying results in poor hatching and weak chickens in the spring.—Pollard's Farm Circular.

The world treats you as well as you treat it.

POULTRY SHOWS.

Poultry shows as announced for this year are:

Mechanics' Pavilion, San Francisco, Cal., December 1-5, 1903, under management of the Oakland Poultry Association. J. C. Williams, Secretary, 33 Market St., San Francisco.

Los Angeles, Cal., December 8-12, 1903.—Annual Exhibition L. A. Poultry Association. H. W. Kruckeberg, Secretary, 123 S. Los Angeles St., Los Angeles, Cal.

Fresno, Cal., December 16-19, 1903.—Annual Exhibition Fresno Poultry Association. Geo. R. Andrews, Secretary, Fresno, Cal.

San Diego, Cal., January, 1904.—The San Diego Poultry and Pet Stock Association. Harry McIntire, Secretary, San Diego.

GREAT SCOTT.

The Farmers' Tribune published at Des Moines, Iowa, publishes the following in its issue of August 19. It's a regular whale of a story and beats ours recently published regarding 10,000 hens averaging three eggs a day each, under electric light treatment. The worst of this is, it seems to be given in sober earnest. Here it is:

"The largest chicken farm in the world is situated at Petaluma, California. It has 13,000 laying hens and many thousand chicks in brooders. The receipts for one days scale of eggs amount to $3,500. This farm supplies more than one-half of the eggs and poultry used in California, besides sending great quantities to the East—Hawaii and the Philippines.' '

Now if 13,000 hens supply more than half the eggs and poultry of California, also great quantities back East, Hawaii, Philippines, etc., etc., we must be light eaters.

Guess again, Tribune. We're some on stories ourselves, but the ribbon is yours.

ANSWERS TO CORRESPONDENTS.

Editor Cultivator:—I have a few questions on pigeons which I would like to have answered in the Cultivator. I feed wheat. Is there any other feed which would be good as a change? What do they build their nests with? They don't seem to like hay. Should they have grit, if so, what would you suggest? How is salt fed them? I have twenty-five pair of homers from the Plymouth Rock Squab Co. of Boston, and have had them ten months now. They are perfectly healthy and seem well contented, but they spend all their time sunning themselves, and so far only one pair have raised squabs. The house is plenty large and clean, they have a large flying pen and running water. Can you tell me what is the trouble? I feed them wheat and a few split Canada peas.—G. E. S., Arroyo Grande.

You have apparently only one female amongst your pigeons. I believe this as they have not bred, and as you say they spend their time sunning themselves, which the males are fond of doing, I would advise you to put a few females into your loft and watch the results.

I think pigeons enjoy a change of ration, I feed my large English Runts wheat, cracked corn, Kaffir corn and rolled oats, a little barley occasionally, they do not like peas or cracked beans, preferring the other food. I give them alfalfa hay and straw for nests, they prefer the little sticks in alfalfa hay. I also give mine coarse river sand and chick grit, charcoal the size of wheat, and a lump of rock salt, or very coarse salt in a bowl. Mine breed about every six weeks. The rolled oats helps give the great size being fed by the parents to the young.

All fowl and animals like a variety of feed.

TESTING EGGS.

A new method of testing eggs for their freshness has been communicated to the Agricultural Society of Saxony.

An egg plunged in water tends to rise with more buoyancy according to its age, owing to enlargement of the empty space at the thick end by evaporation of water from the white. Hence the egg takes a different position in the water.

Fresh eggs remain horizontal, an egg three or five days old makes an angle of twenty degrees with the horizon, one eight days gives an angle of forty-five degrees, and at the end of fourteen days the angle is sixty degrees. An egg three weeks old lies at seventy degrees. One three months old remains vertical, and when it is older still it floats.—Poultry Journal.

In order to perpetuate and more fully develop certain points, it may be necessary to inbreed fowls, the same as fine stock breeders have developed points by inbreeding of choice animals. But it must not be continued long as it has a tendency to decrease size, standard and vitality. Poultry, as well as animals, should never be inbred more than twice, without going outside the family and infusing new blood of the same breed, after which another inbreeding may be done. Bates was the greatest breeder of the Shorthorns, he developed a fine family of that breed by doing so, but they run too small and fine and lost much of the vitality of the original breed; so it will be with inbreeding of poultry, they will run smaller, finer, will be less healthy and the eggs will be less fertile.—The Farmers' Tribune.

C. J. Armstrong, a successful poultry raiser of Sonoma county, says: "Run incubators in February and March. A little blue stone in the drinking water makes a good tonic for drooping chickens. The less patent medicine and patent foods used the better for the chickens. Plenty of good common sense and good care will bring better results than any other method.

Don't take too much stock in spontaneous sympathy. It doesn't wear well.

THE PEA-FOWL.

It seems a pity that such a superb creature as the male of this variety of the gallinaceous tribe should be so seldom seen, that is, compared with other useful and ornamental fowls. Some people object to him on account of the peculiar cry which he makes in the early morning, because he is destructive in the garden and quarrelsome with other poultry. But with regard to ourselves he becomes quite tame and gentle, even taking his food out of the hand; his greatest charm, however, is his lovely plumage, which is more gorgeous than that of any other bird which has been acclimated in these Isles. His body is about the size and shape of the Guinea fowl, his head is very small, of a beautiful purple, and has a tuft or crest of 24 feathers which are only webbed at the tips, where they show lovely green and blue reflections; his eyes are dark brown with pearly edges. His neck, which is very long and slender, and his breast are rich purple casting beautiful blue reflections; his back is green, the feathers being laced with copper color; his wings are light gray, barred with black, gradually shading into dark blue; the primaries, or quill feathers and the real tail feathers are dark rich chestnut; his thigh are generally gray, and the other parts of the body black; and his legs, which are spurred, and like those of ordinary fowls, and his feet are brown; last, but not least, for it measures about three feet long, comes the train. This is commonly called the tail, but is composed of the tail coverts, these feathers growing from the middle of the back, and being glossy green, ocellated at the tips. When the train is raised and spread open like a fan, the tail is also elevated and forms a frame or support for it. The peacock sometimes makes a curious clattering noise by shaking his plumes together, probably to attract the female.

The peahen, like most other female birds, is much quieter in color, most of her body being chestnut brown, mottled or shaded on different parts with dull or greyish white, particularly on the wings and tail. She also has a crest, but neither so tall nor so brilliantly shaded as the male's.

This is the common peafowl, which is so plentifully found in some parts of the Indian jungle, that to go out shooting it is not thought good enough sport. This species is indigenous to India, Ceylon, and the adjacent islands. It has, however, been kept in England for many hundreds of years, and as early as 1254 Henry III offered a peacock as a prize at some athletic sports.—Fancier's Review, Scotland.

"Yes," said the inventor, "I think I see millions in it, if I can only get the thing to work." "No doubt," said the doubting friend. "What have you in mind now?" "A scheme for confining cyclones in bicycle tires. See? There is your ideal motor, at merely the cost of capture."—Indianapolis Journal.

Chickens at Petaluma, the Poultry Center.

The last census states that Petaluma has over one million hens, mostly White Leghorns. About $3,500 per day are the receipts from the sale of eggs alone.

POULTRY PROFITS.

Does poultry raising in California pay? Often I am asked that question, and without hesitation I can say—yes. Some one with a head for statistics has figured that the egg product in the United States amounts to more than the combined gold and silver production; and that eggs and poultry together are nearly double the value of the gold and silver output. My experience with the two as sources of income makes me believe that his figures are correct, especially if the chicken ranch is in California.

As a side issue I raise a few pure white Holland turkeys for my own use and a few years ago was fortunate enough to get a pair of Indian Runner ducks from a celebrated Australian flock, which are fast claiming a place beside the chickens as money-makers. These ducks flourish as wonderfully as though natives of California. The dryness and the conditions in general seem especially suited to their needs, probably because they came originally from India. As layers they have averaged 233 eggs a year. The eggs taste like those of the hen, and the meat is delicious in flavor, quite like that of the canvas-back. They are easy to raise, require no water and bear confinement well. Besides being profitable, poultry-raising has the additional advantage of being outdoor employment, and that in California means health, which is everything.—Mrs. A. Basley in Sunset Magazine for September.

TOO BUSY TO EXHIBIT.

Office of the Must Hatch Incubator Co. (Incorporated). A. E. Bourke, President. Phone Black 1192.

Pelaluma, Cal., August 29, 1903.

Cultivator Publishing Co., Los Angeles, Cal.

Gentlemen: Yours of the 25th at hand, and in reply wish to say that, owing to the rush of business and personal attention required in supervising the enlargement of and the installation of new and improved machinery in the Must Hatch Incubator plant, we will be unable to make any display of our Must Hatch Incubators and Supplies at the State Fair at Sacramento, this season.

Our new factory is now complete, size 145x40 feet, three stories high. We are now prepared to fill all orders on short notice, but owing to delay while enlarging we were delayed in filling past orders.

Inclosed you will find copy for our ad, which you will run as per contract. Yours, very truly,

MUST HATCH INCUBATOR CO.,
Per A. G. S.

Visiting poultrymen to the State Fair will miss a great treat by the Must Hatch people being unable to exhibit their Must Hatch Incubators and Brooders, for they are one of the best and most successful machines on the market today, and are of special interest to Californians as they are a home product. The Must Hatch Incubator Company began business on a small scale three years ago in the attic of a small barn at Petaluma, and today the plant is one of the special points of interest to all visitors to Petaluma, the people of Petaluma pointing with pride to the success of the firm. In the design the incubator differs very much from the ordinary machines and are the original ideas of Mr. Burke, who has by tireless energy and experiment constructed a machine that is, without doubt, one of the best on the market, sales of machines now reaching all quarters of the earth.

For catalogues and information write or call on the Must Hatch Incubator Company, Petaluma, Cal.

"Hear the story about the fly paper?"

"No."

"Well, you'll be stuck on it."

Where Poultry Supplies Are Handled by the Carload

The A. R. Coulson Co., Petaluma, Cal.

SO SUCCESSFUL

Has been the sale of Coulson's Poultry Medicines and Poultry Foods, etc., that on August 25 a company was incorporated for $25,000.00 and only $5,000.00 worth of stock remains to be sold. The balance has been paid in. The name of the company will be A. R. Coulson Company and the headquarters and principal factories will be at Petaluma. The company is incorporated for a term of fifty years and will manufacture, buy, sell and deal in merchandise of every description. The number of its directors shall be five, of which A. R. Coulson is president. The amount of capital stock actually subscribed is as follows:

NAME	RESIDENCE	AMOUNT
A. R. Coulson	Petaluma	$9,000.00
Lucinda Coulson	"	1,000.00
R. M. Skinner	"	100.00
Helen M. Skinner	"	4,900.00
J. Hall Lewis	"	1.00

SUCCESS INSPIRES CONFIDENCE

Our success was immediate, That the confidence of our earliest customers was not misplaced is shown by the rapid growth of our business. Today we point with pride to the best equipped establishment of its kind on the Pacific coast, occupying over 5,000 feet of floor space, in California's famous poultry city, Petaluma. Here we manufacture medicines, extracts, etc., but our principal output is poultry medicines and balanced rations for poultry and stock. We send out from 10 to 15 carloads of poultry food a month.

A larger amount of Coulson's Poultry Food is used by the poultry men near Petaluma. Many of the poultry men haul to their ranches by the 4-horse wagon load. For instance: Geo. Gaston at Two Rock has 2500 laying hens and feeds them a mash every morning of Coulson's Egg Food, using over 50 sacks a month of it, and has been feeding it for over a year with good results; W. Church, who has about 3,000 chickens; C. C. Boyson, who has about 3,000; and Mark Hardin, who has about 3,000, all use big loads of this feed with good results. Many of these large ranches near Petaluma are commencing to hatch out large broods of young chicks and they feed them Coulson's Growing Chick Food, which is a complete balanced ration food for little chicks, being composed of grains, seeds and meals, etc., all thoroughly and properly mixed ready to feed.

IF YOU ARE GOING TO RAISE ANY LITTLE CHICKS

You surely want to get in a few sacks of Coulson's Chick Food. A free sample will be sent for the asking. Over 125 stores in California now handle Coulson's Poultry Foods, but in case no one has it for sale in your town, you can send to factory and get factory prices and have it shipped to you by freight. We will soon have ready for free distribution 10,000 copies of illustrated catalogue and poultry account book and egg record, a nice book to keep accounts of the profits or losses from the poultry business. We can also supply you with White Leghorn eggs for hatching in any quantity at a little above market quotations. We also manufacture Lice Killers and Poultry Disinfectants and Medicines and if you want good Poultry Supplies at small cost send to us or ask your dealer for Coulson's Poultry Foods.

NOW AND THEN.

GRANDSON.

(Allegro accelerando.)

Now I wonder, excuse my impertinent tongue,
How you ever went anywhere when you were young;
For you couldn't recline in a plush-covered chair
And be rapidly carried with ease anywhere
While the train hurried on over mountain and dale
To the trumpet of steel and the drum of the rail;
And you couldn't sit down on a trolley car seat
And be jiggered and jerked through the length of the street;
And the glorious wheel, like a bird on the wing—
You had not even heard of the wonderful thing.
So I often have wondered and wish I could know,
If you ever went anywhere, how did you go?

GRANDFATHER.

(Moderato morando.)

Well, boy, I know
Old times were slow,
One trip this way,
Mid-week market day;
Go out, catch Bill,
Warm side of East Hill;
Hitch up. Take time.
Load up; cheese prime;
Eggs, fresh; butter sweet;
All packed, clean, neat.
Get in, sit square,
John here; Ruth there.
Good-bye; huddup, Bill!
Long road, up hill;
One hour, three miles;
John speaks, Ruth smiles.
Fresh breeze, pure air,
No coal smoke there.
Grass, green; mountain, high;
Cool brook runs by.
Road now runs down,
By and by reach town;
Sell produce; buy rice,
Tea, dress, nails, spice.
Start home, sun low,
Old Bill better go.
Cows milked, stars peep,
Soft bed, sweet sleep.
Slow times—but then,
Good women, strong men.

—New York Independent.

THE POPPY AND LIMITED EXPRESS.

The first train leaves at six p. m.
For the land where the poppy blows;
And mother dear is the engineer,
And the passenger laughs and crows.

The palace car is the mother's arms,
The whistle is a low sweet strain;
The passenger winks, and nods and blinks,
And goes to sleep on the train!

At eight p. m. the next train starts
For the poppy land afar;
The summons clear falls on the ear,
"All aboard for the sleeping car!"

But what is the fare to poppy land?
I hope it is not too dear;
The fare is this, a hug and a kiss,
And it's paid to the engineer!

So I ask of him who children took
On his knee in kindness great,
"Take charge, I pray, of the trains each day
That leave at six and eight."

"Keep watch of the passengers," thus I pray,
"For to me they are very dear;
And special ward, O gracious Lord,
O'er the gentle engineer.—Selected.

The Treason of Loyal Benham

(Continued from last week)

The next afternoon a group of officers waiting for their horses to be brought was gathered before headquarters. The general had been joking Capt. Crane about a sailor's proverbial fear of a horse, and, indeed, if there is a sight as laughable as a soldier trying to manage a boat, it is a sailor trying to manage a horse. Benham had no claims to fine horsemanship and saw with an inward qualm the horse assigned to him. It was a large, black war horse, powerful, and spirited, whose prancing and restlessness added to the fire in his eyes made every one give ample space to his hoofs. The sharp-eyed general guessed the young man's feelings. "Felton," he called to one of the younger officers, "change horses with Mr. Benham; that black beast looks dangerous."

Benham fell an apt victim to that foolish pride that refuses to grant that any one can excel ourselves in an accomplishment, a pride that blinds to all dangers by fear of a safety that seems humiliating. "Thank you, sir," he said, rather stiffly; "I think I can manage him."

"Well, be careful," advised the general. "He was captured in a skirmish yesterday, rider and all."

Benham mounted from the horse block and the cavalcade rode off. The horse had been so quiet since his bridle had been released by the groom that Benham regained confidence and began to pay less attention to his horsemanship and more to the conversation of his comrades.

The party were beyond the Federal pickets when a large house that had been partly burned attracted their attention. They rode in between the gateless posts, over a lawn littered by furniture that had been dragged out during the raid. A massive desk had been overthrown and broken into during the eager search for valuables; papers and letters thrown from its rifled drawers had blown about the grass. Benham saw among those papers a truant sheet ornamented with a crest; wondering if the crest were familiar to him he determined to secure the sheet. Knowing that if he dismounted his efforts to regain the saddle would be ungainly, he drew his sword, intending to spear the paper. Whether or not the horse thought the rasp of the sword was a signal to charge, Benham had no leisure to decide. With an alarmed snort the horse sprang forward like a steel spring suddenly uncoiling and sped up the road, presenting no less ludicrous a spectacle than Benham's embracing his steed's neck as desperately and as lovingly as did John Gilpin of mirthsome memory in a similar predicament.

Several officers at once gave chase, but the runaway's speed was not to be equaled, and the would-be rescuers soon became aware of a danger that forced them to unwittingly abandon the luckless Benham to his fate. The Confederate picket line was not two miles away. This painful fact forced itself upon Benham at once and it is to be feared that he swore roundly. The beast was going back to the rebel camp and would take him there. How they would laugh at him! To become a dweller in Libby prison was not a pleasant futurity, but to be carried within the enemy's lines like a bag of meal—to be the captive of a runaway horse! Benham feared the rebel's jeers more than their prison; be began to fumble blindly with the holster straps, determined to shoot the horse even if the fall broke his own neck. He could alread see the picket man pointing at him, could almost hear him shout to a gray clad comrade. His struggle with the holster flap almost cost him his seat, but at last he dragged out the loaded pistol. He was on the crest of a hill that suddenly dipped toward a deep hollow; the pickets were hidden from sight as the horse plunged down the hill. Benham had decided to shoot the horse when the hill was reached; he would then be out of sight of the pickets, with a better chance to escape them should he be hurt.

He put the muzzle of the pistol behind the horse's ear and was about to pull the trigger when a slight figure stepped from the roadside almost in front of the unmanageable horse. "Conqueror!" cried the girl's voice. The horse quivered and stopped so suddenly that Benham was almost thrown. With a low whinny of delighted recognition Conquerer ambled up to the girl and put his great nose on her shoulder; then Benham found found himself face to face with Phyllis Yorke.

"Good afternoon, Miss Yorke," he said. "Thank you for saving me from so humiliating a catastrophe. I suppose that I should send word that the couch prepared for me in Libby prison will lack an occupant."

He at once regretted the raillery, for he noticed that she was pale and grave; it seemed as if some final misfortune had at last overcome her courage.

"I am going to our camp to fetch home my brother, Richard; father is worse, and I fear that this is the end. Oh, sir! how does it happen that you are riding Richard's horse?" she asked, anxious lest more ill was to come.

Benham gently took her hand with a kindness that she could neither mistake nor resent. "I'll tell you all I know about your brother," he said. "though I wish you could learn it from any one but me. Gen. McClellan himself told me that this horse was captured with his rider in yesterday's skirmish."

Phyllis began to weep bitterly with the deep, hopeless sobs of a broken hearted child.

"Don't," begged Benham, helplessly; "please don't! I'll see if I can get you brother released on a parole; indeed I will, only don't cry."

"I am very selfish," she said; "it is dangerous for you to stay here. I can rely on your promise; for how cruel it would be if Richard should not be home if father"—a sob choked her.

The thud of hoofbeats muffled in the deep dust was heard and Benham knew that a party had come to his rescue in spite of the risk. Phyllis at once prepared to hide among the rank weeds and bushes of the roadside.

"Your brother will come home tonight, Miss York, I promise," said Benham, as, with a look of gratitude she stepped into the thicket.

The newcomers were three of McClellan's staff officers including Felton. In a twinkling Felton mounted Conqueror, while Benham took his rescuer's sweating horse, and they spurred back up the road at nearly as good a pace as Benham had come until increased distance from the Confederate pickets made speed less needful and conversation possible. When headquarters was reached Benham learned that McClellan had invited his guests to remain for supper. During the meal Benham was the target for no little chaffing, which he took good humoredly, telling how strangely the runaway had stopped, but, of course, saying nothing of the girl to whom he owed his liberty.

After evening parade, the senior officers withdrew to the general's private office for an evening to be spent at cards and wine. Benham racked his brains for a plan to fulfill his promise to Phyllis. He knew that now it would be impossible to demand an audience with McClellan. The younger officers were smoking on the veranda and Benham realized that the time was passing without any attempt to free Richard Yorke. At last fate was kind to Benham. "Let's go over to the guard house, Benham," suggested Felton; and call on the prisoners. There's one chap I know you'll like, a Capt. Yorke; he's won our respect by his sensible acceptance of his misfortune, so we're great friends, and every one does all he can to make things easy for him. By Jove! he owns the horse you rode this afternoon; he'll enjoy that joke."

Benham consented, with a carefully assumed carelessness. Ten minutes later they were in the guardhouse and Felton was introducing Benham to a tall, slight young man whose resemblance to Phyllis was so marked that Benham felt the ceremony of introduction to be quite superfluous.

"Let's go outside and smoke," said Felton; "it's stuffy in here."

"With your permission said the captain, smiling. The sentries made no protest at this breach of discipline as their prisoner passed them, for such a lapse was common, Capt. Yorke being often privileged by his friendly captors. Benham was formulating and abandoning plans so fast that he hardly heard Fenton telling of Conqueror's exploit. Their laugh was interrupted by an orderly. "Maj. Hall's compliments and would Mr. Felton come to his tent for a minute," was his message.

"I'll be back soon," Felton called as he followed the orderly.

"Quick!!" whispered Benham to the astonished captain. You must escape. I have seen your sister and your father is dying, perhaps. I promised that I would get you through the lines."

Yorke gave a muffled exclamation, then followed Benham as he ran through the darkness as quietly as possible. Now running madly, now hiding from observation, they passed through the camp safely. If Felton should return before they were nearer the pickets—Benham caught his breath at the thought; an indefinite time that seemed to the straining muscles of the runners like eternity, and then behind them they heard shots and cries.

"To alarm the pickets," gasped Benham. They were near the lines now. Suddenly a challenge rang through the darkness. "Who goes there? Halt!"

"Answer him," whispered Benham, "while I run on to draw his attention to me, and then perhaps you can slip past him."

"No!" cried Yorke.

"You shall! I gave her my word;" and Benham dashed on by the sentry.

"Halt!" commanded the man again, running toward Benham, and then firing after him without parley. Meanwhile Yorke had made his escape.

Half an hour later a party from headquarters found Benham lying unconscious a few rods from the picket line, wounded slightly but painfully in the shoulder. When he came to his wound was dressed and he was placed under arrest upon the charge of aiding a prisoner to escape. He stubbornly refused to explain to any one, though he knew he would be subject to court martial; the penalty might be death, at least the loss of his commission and dismissal from the service. He was miserable when he thought of the pain his disgrace would give his family; he almost hoped for death in preference to the shame that was harder to bear, but his heart exulted that he had kept his word to Phyllis in spite of the cost.

At the court martial his behavior was a baffling mystery to his friends. He again refused to explain, pleading guilty to the charge; he had nothing further to say. There was no wincing, no sign of shame when he heard his sentence, and he stood straight and tall between his guards, gazing fearlessly at the judge advocate as that official solemnly read:

"Loyal Benham, lieutenant of the United States navy, having been by his own assertion and by the finding of this court found guilty of treason in wilfully aiding and abetting a prisoner to escape, is hereby sentenced to lose his commission in the said navy, to be dishonorably dismissed from its service, and to be deprived of his epaulets and insignia of rank before his ship's company and the officers and men of the Army of the Patomac, to be assembled on the parade ground at Harrison's Landing at noon on the seventeenth day of July, 1862."

When the prisoner was taken back to his cell the judge advocate said: "Gentlemen, we have not yet seen the bottom of this affair; Mr. Benham's manner is not that of a guilty man."

On the morning appointed for Benham's degradation Capt. Crane was closeted with the general. The captain felt great repugnance for his part in the execution of the sentence, for as Benham's commanding officer it was Capt. Crane's duty to tear from the traitor's coat the insignia of his rank. The punishment was severe for even so flagrant a military offense, but in those stern days of war severity was practiced for the sake of example, as a warning to probable breakers of military laws.

The officers' talk was interrupted by the not unusual sound af a gallop-

ing horse stopping at the door. The orderly came in and said: "Capt. Yorke sir would like to see you, sir."

"Bring him in," said McClellan. Before Capt. Crane and his host could exchange more than glances the door opened to admit a tall, slender young man in a shabby uniform of Confederate gray. He saluted stiffly, waiting for the general to speak.

"You have come in to give yourself up, I suppose?" asked McClellan, crisply.

"Yes, sir," answered the captain.

"Why? Were you under parole not to return to your regiment?"

"No, sir, but I hoped that my return might save Mr. Benham——"

"Nothing, sir; his offense remains the same and he shall pay the penalty."

Capt. Yorke made no reply and the general continued: "You know the treatment due prisoners that have once escaped?"

Yorke bowed. The general tapped the bell, saying to the orderly who answered the summons: "Send for a guard to escort this man to the guardhouse. where he is to have an inner cell. He is also to be put in irons, tell the officer of the guard."

Five minutes later the heavy tramp of feet was heard in the hall; a soldier stepped to each side of Yorke, who again bowed.

"Right about face—march!" ordered the corporal, and Richard Yorke was marched away through the shimmering heat to his self-sought prison.

The midday sun seemed to center its rays upon the worn parade ground. There was scarcely a sound in the ranks as the men waited to see the humiliation of a comrade in arms. detailed for that duty, Benham was leaving his cell. As he stepped out into the sunshine he saw a tableau that made him stop like one turned to stone. A group composed of another prisoner and his guards stood near by. The prisoner was a slight young man, tall and pale, his wrists already in chains, and on his ankles a kneeling man was riveting more irons. Too late did the prisoner try to hide his face in his manacled hands. Benham's keen glance saw all. "Captain Dean! Captain Dean!" he cried, excitedly.

The captain of the guard stepped to his side. Lowering his voice, Benham pleaded earnestly: "Captain, by all you hold sacred, beg General McClellan to let me speak to him. That prisoner is not Capt. Yorke."

The earnestness of Benham's manner did not fail to impress Capt. Dean. As they marched on he said, "I'll do my best for you, sir," and he was as good as his word, for, after a brief conversation with the general, Capt. Dean returned, escorted Benham to the general, saluted, and retired out of earshot.

"Well, sir?" demanded McClellan, sternly.

"General, it is not Capt. Yorke that your men are fettering yonder, but his sister," said Benham quietly.

"What," cried McClellan. "What the"—— but his sentence remained unfinished for a new actor came upon the scene. A flushed, wild eyed man, white with dust and mounted on an old slant jawed mule, rode up to McClellan and Benham, "My sister?" Where is my sister?" he cried distractedly.

"Good God, he's a madman!" exclaimed the general.

"No, you are all mad, you cursed Yankees that can't tell a girl from a man. I'm Richard Yorke and I have come to give myself up. My sister stole my horse and my uniform and came here, personating me, because I was crazy with fever and couldn't come myself to save Loyal Benham."

"Miss Yorke is safe, captain," said Benham, putting his hand on Yorke's shoulder as he slid from the mule's hollow back.

The general swore an alleviating oath and rode off to the guardhouse; five minutes later he returned leading a horse, upon which sat the abashed personator of Richard Yorke.

"Benham," said McClellan mildly, "permit me to tell you that though you are a stubborn fool your service should be proud of you. Capt. Yorke, why didn't you ask me for a leave on parole to visit your father? I am not a brute sir. I wish, Miss Phyllis, that I had an enemy as interested in my welfare as you are in Mr. Benham's. Adjutant," he continued louder, "you may dismiss your battalions; I guess the execution of this sentence is indefinitely postponed. Benham, I shall expect you and Capt. Yorke and Miss Phyllis, if she will honor us, to dine with me at headquarters." And wheeling his horse, the general rode away, his staff following.

It was a jolly party that dined at headquarters. Phyllis was as charming in her own clothes as when masquerading as her brother, for Maj. Graham had thoughtfully unearthed from his closet some of her abandoned finery. Her exploit was the toast not alone of the officers' mess, for around the campfire her bravery was admired; even today the incident is remembered by the remnant of that glorious army of the Potomac.

Fate must have wearied of buffeting the Yorkes, as in spite of Richard's imprudence in defying his illness to return to captivity his inevtable relapse was brief and not severe. His father, too, was recovering, more slowly, but as surely.

The Yorke mansion, all ravages repaired, is now once more possessed by its owner. Richard Yorke is a prosperous attorney. Conqueror, old and stiff, again champs the oats of plenty in the stable that was once his master's prison. If a matrimonial argument arises between Capt. and Mrs. Loyal Benham the gentleman has but to say, "Capt. Yorke, I believe." This usually settles the matter, unless the lady saucily retorts, "It's a lovely day, dearie; do let me have Ned saddle Conquerer for you."

"No," laughs Benham, "let the shoemaker stick to his last."—Farmers' Sentinel.

HE'S A BRICK."

"He's a brick" is a favorite saying among the boys. It originated with the king of Sparta, who was showing an ambassador from Epirus over his capitol. The ambassador was surprised at finding no walls built for the defense of the town.

"Thou canst not have looked carefully," said the king. "Come with me tomorrow and I will show you the walls of Sparta."

The next day the king led his visitor to where his great army was drawn up in battle array, and said:

"There thou beholdest the walls of Sparta, and every man a brick."

HOW TO GET GOOD OUT OF BOOKS.

You should treat a book as you would a person with whom you are talking for information; that is, question it, read it over and turn back and try to get at the meaning; if the book itself does not answer the questions you raise, go to some other book, ask a dictionary or encyclopedia for an explanation. And if the book treated in this way does not teach you anything, or does not inspire you, it is of no more service to you than the conversation of a dull, ignorant person. I just used the word "inspire." You do not read all the books for facts or for information merely, but to be inspired, to have your thoughts lifted up to noble ideas, to have your sympathies touched, your ambition awakened to do some worthy or great thing, to become a man or a woman of character and consideration in the world. You read the story of a fine action or a heroic character—the death of Socrates, the voyage of Columbus, or the sacrifice of Nathan Hale, or such a poem as "The Lady of the Lake"—not for information only, but to create in you a higher ideal in life, and to give you sympathy with your fellows and with noble purposes. You cannot begin too young to have these ideals and these purposes, and therefore the best literature in the world is best for you to begin with. And you will find it the most interesting.—Charles Dudley Warner.

An artist in cooking is a woman who can get up a nice meal out of a small quantity of material. Any woman can get up a nice meal if she has everything to do with and a market to run to, to get anything she may want.

"Women feel where men think," said the female with the square chin.

"Yes," sighed the man who had been married three times; "that's why men become bald."

LEMON PIE.

Four eggs, one and a half cups sugar, two-thirds cup water, two table-spoons flour, one lemon. Beat the yolks of eggs until very smooth (beat the yolks a long time and whip the whites well), add the grated peel of lemon and the sugar, beat well and stir in the flour, and add the lemon juice, if the lemons are small two may be necessary, and lastly the water; stir well and pour in pie pans lined with paste. When baked take from oven, spread over them the whites of eggs beaten dry and smooth with four table-spoons pulverized sugar; return to oven and brown slightly. The above is the receipt for two pies.

* * *

COCOA-NUT PIE.

One pint milk, a cocoa-nut, tea-cup sugar, three eggs; grate cocoa-nut, mix with the yolks of eggs and sugar, stir in the milk, fill in the pan even full, and bake. Beat whites of eggs to froth, stirring in three table-spoons pulverized sugar, pour over pie and bake to a light brown. If prepared cocoa-nut is used, one heaping tea-cup is required.

* * *

PUMPKIN PIE.

Stew pumpkin, cut into small pieces, in half a pint of water; and, when soft, mash with potato masher very fine, let the water dry away, watching closely to prevent burning or scorching; for each pie take one well beaten egg, half a cup sugar, two tablespoons pumpkin, half a pint rich milk (a little cream will improve it), a little salt; stir well together, and season with cinnamon or nutmeg; bake with under crust in a hot oven. Some steam pumpkin instead of stewing it.

HOMELY HINTS.

One of the best and handiest things to clean bone, ivory or pearl knife handles is moist fine salt. Polish afterwards with a dry, soft cloth.

A few tablespoons of kerosene in a pail of warm water makes the washing of windows and mirrors a lighter task than if soap or any alkali is used.

Cake ought to rise to its full height before it begins to brown. This applies specially to sponge cake.

When you wish to keep boiled or baked potatoes warm for some time, lay a towel into a colander, wrap it snugly about the potatoes, covering them closely, and set inside a saucepan with a little water at the bottom kept just at the boil.

When making bags to put away silverware always use the unbleached material. Sulphur is used for bleaching, and its influence will quickly tarnish the silver.

A good thing for cleaning brass or copper is sweet oil and putty powder. Afterward, wash in hot water and soap, then polish.

Measure the amount of a gelatine or cream mixture before putting it in a mold, knowing how much the mold holds. Fill to the very brim, for it is almost impossible to turn a jelly from a mold when not perfectly full.

THE INEVITABLE.

I like the man who faces what he must
With step triumphant and a heart of cheer;
Who fights the daily battle without fear;
Sees his hopes fail, yet keeps unfaltering trust
That God is God; that somehow, true and just
His plans work for mortals. Not a tear
Is shed when fortune, which the world holds dear,
Falls from his grasp; better with love a crust
Than living in dishonor; envies not,
Nor loses faith in man; but does his best,
Nor even murmurs at his humbler lot,
But with a smile and word of hope gives zest
To every toiler. He alone is great
Who by a life heroic conquers fate.
—Sarah Knowles Bolton.

THE BEE'S EXAMPLE.

How doth the busy little bee
Improve each shining minute?
He jumps on every flower he sees,
And pumps for all that's it it.
Omaha World-Herald.

Miss Smart—Have you ever been through algebra?"

"Yes, but it was in the night and I didn't see much of the place."

It is only because the water works that the fountain plays.

Few men have weak eyes from looking on the bright side of life.

"Pa, what is a bigot?"

"A bigot, my son, is a person who doesn't think as I do and sticks to it."

Popping of lamp-chimneys is music to grocers.

MACBETH.

If you use a wrong chimney, you lose a good deal of both light and comfort, and waste a dollar or two a year a lamp on chimneys.

Do you want the Index? Write me.

Los Angeles Markets.

The Creamery Board of Trade still holds B. of T. at 60c, as it has for several weeks. The supply in the warehouse is extremely heavy, with seemingly no particular rise. There is, however, an exceptional demand for fresh stock.

Eggs show no material change since last week, but an increase is promised within a day or two.

Tomatoes have slightly advanced.

Fresh fruits of fine grades are readily picked up, with mediums not particular heavy call.

Potatoes are quoted practically the same as last week, but the market if anything is slightly weaker. Strawberries slow sale, and seem to show very poor keeping quality.

All poultry, especially chickens, are very scarce, and top quotations are readily commanded by choice stock.

Cantaloupes and watermelons are coming rather slow and the market is showing a tendency of stiffening.

Unbaled hay is being delivered in small quantities.

Wheat market is starting in very strong.

Barley steady.

Oats light receipt. Crops short.

San Francisco Markets.

Dairy.

Butter is firmer. Market is very satisfactory to the seller. There has been about a cent advance in the past week and the general condition is such that nearly everything offered is picked up at once. That applies to the fancy grades. Poor stock as a rule begs for buyers. Storage still coming out.

BUTTER—Per lb:

Creamery, extras	29	
Creamery, good to fancy	26	@28
Dairy extras	24	@25
Dairy choice	21	@23
Store	18	20
Eastern Creamery	23	24

CHEESE—Per lb:

Cal. Creamery, mild new, extra	14	15
Cal. Creamery, mild new, choice	13½	@14
Young America	14	@15½
Eastern, New York Cream, Cheddars and flats, new	14½	@16

Eggs and Poultry.

Eggs likewise have taken an upward turn, being some better than a cent higher than last week, with everything cleaned up from the market that is offered. The bulk of the business as a rule is in storage lots which are being brought out. These are sold for full quotations. Fresh ranch, clean and even in color are instantly picked up at top quotations. Two carloads of Eastern poultry have arrived this week, largely of young stock. The local offerings are somewhat easier.

EGGS—Per doz:

Ranch, selected, large	33	@34
Ranch, good to choice	29	@32
Store	22½	@27½
Cold Storage	24	27
Eastern	19	@24

POULTRY—Old Roosters, per dozen, $4@5; young Roosters, $4.50@6; Fryers, $3@4; Broilers, large, $2.50@3.50; small, $2@2.50; Hens, $4@5.50; Ducks, per doz., old, $3@4; young, $3.50@4.50. Turkeys, nominal; Geese, per pair, $1.50; Goslings, $1.50@1.75; Pigeons, per doz., $1.50@1.75; do, old, $1.50.

Fruits and Vegetables.

The more desirable grades of deciduous fruits are not as plentiful as last week, and first class fruit demands top quotations quite readily. The ordinary quality of fruit is in abundance and has slow sales. Bartlett pears are in good request, quoted at $1.50. Canners are paying at the rate of $35 per ton. First class peaches sell well up to quotations. Freestones readily bring maximum and sometimes slightly above the market. Plums and prunes while not a drag are rather slow in demand. Pomegranates and nectarines are in limited demand. Watermelons are in abundance but sell close to the quoted price. Cantaloupes and nutmegs are steady. In grapes the demand is principally for the seedless, which sell at $.65 per box. Some carried over grapes sold as low as $20 to $30 per ton to wineries. Zinfandel wine grapes are quoted at $24 to $25 per ton. Strawberries are plentiful, some ordinary lots being picked up at 2½ cents. Blackberries are scarce and demand ready sale at top quotations though some ordinary were sold at two cents.

Potatoes are slow, receipts rather light, but there is rather a heavy supply on hand. Inquiry for shipment is slow. Sweet potatoes are plentiful and have declined materially in the last week.

APPLES—Per box, common to choice, 25@75c; fancy, 85c@$1.10; Crabapples, per box, 25@65c.

PEACHES—Per box, 35@75c; carriers, 40@65c; large open boxes, 60@75c; bulk, per ton, Clingstones, $20@25.

PEARS—Per box, No. 1 Bartlett, $1.25@1.50; common, 75c@$1; other varieties, per box, 40@60c.

PLUMS AND PRUNES.—Per box or crate, 25@60c; large open boxes, 40@75c; bulk, per ton, $20@25, as to variety.

FIGS—Per box, 75c@$1.

CANTALOUPES—Per crate, 60c@$1.

NUTMEG MELONS—Per box, 25@50c.

WATERMELONS—Per 100, $7@20.

GRAPES—Per small box, 25@65c; crate, 40@85c; large box, 65c@$1.25, as to variety.

NECTARINES—Per box or crate, 75@90c.

POMEGANATES—Per box, 65@85c.

QUINCES—Per box, 50@75c.

BERRIES—Per chest: Strawberries, Longworth, nominal; large varieties, $2.50@5; Blackberries, $3@5; Raspberries, $7@9; Huckleberries, per lb., 7@8c.

CITRUS FRUITS—Per box, repacked: Oranges, Valencias, $2@3; St. Michaels, $2@3; Seedlings and Mediterranean Sweets, nominal; Lemons, 75c@$2.50; Grape Fruit, $1@2; Limes, $4@4.50.

VEGETABLES—Asparagus, per box, nominal; Tomatoes, per box, river, 25@50c; do, bay, 30@75c; Green Peppers, per box, Bell, 25@40c; Chile, 25@40c; String Beans, per lb., 2@3c; Wax, 2@3c; Lima, per sack, $1@1.25; Green Peas, per lb., 3@4c; Egg Plant, per box, 35@50c; Summer Squash, per box, 25@40c; Cucumbers, per box, 25@40c; Garlic, per lb., 2@3c; Green Corn, per sack, 50c@$$1.25; crate, 50c@$1.50; Okra, per box, 25@35c; Marrowfat Squash, per ton, $10@12.50.

ONIONS—New Silver Skins, per ctl., 50@65c.

POTATOES—Per ctl.: River Burbanks, 60c@$1.25; Early Rose, 75c@$1; Garnet Chile, $1@1.15; Salinas Burbanks, $1.25@1.65; Sweet Potatoes, per lb., 1½@2c.

Dried Fruits, Nuts, Etc.

Asto dried fruit the Chronicle of this date says:

"The Dried Fruit market is buoyant under a vigorous demand for speculative purposes and the prevailing prices are strongly held and tend toward a higher level. The buying interest continues mainly centered in Peaches, Pears, Apricots and Apples, and holders are firm in their demands for full figures. Now that the reports of the over-estimation of the Prune yield are being verified, offferings are in higher favor, and many local brokers and jobbers predict improved values within the near future. There are still several dealers who closed early contracts short and it is quite likely when they make their efforts to cover, prices will advance. At present supplies are held well in hand at the top figures; and holders are showing some little indifference about parting with their stocks. Honey is in good supply and is meeting with a fair sale at the appearing figures. Trading in Nuts is still stagnant and values are largely nominal.

Quotations are:

APPLES—Evaporated, 5@6c.

APRICOTS—Royal, fancy, 9@9½c; choice, 7½@8½c; Moorparks, choice, 10@11c.

PEACHES—Choice, 5¼@6½c; fancy, 7@7½c.

PEARS—Choice, 5½@7c.

PRUNES—Four sizes, 60s to 100s, 2⅝@3c; 1902 crop, 2½@2¾c, with ½@1c premium for large sizes.

NECTARINES—White, 4@5c.

FIGS—White, 4½@5c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1902 crop: Loose Muscatels, 50-lb boxes, per lb., 2-crown, 5½c; 3-crown, 5¾c; 4-crown, 6c; Seedless, loose Muscatels, 5c; London Layers, 20-lb boxes, per box, 2-crown, $1.40; 3-crown, $1.50; fancy clusters, 4-crown, $2; Dehesa, 5-crown, $2.50; Imperials, 6-crown, $3. These prices are subject to change without notice. Seeded, f. o. b. at Fresno, per lb.: Fancy, 16 7¾c; 12 oz., 6¼c; bulk, 7½c; choice, 16 oz., 7½c; 12 oz., 6c; bulk, 7¼c.

NUTS.—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Pecans, 11@12c; Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c; Chestnuts, Italian, nominal.

Grain and Produce.

CHICAGO, Sept. 2.—There was no selling pressure in wheat today until top prices were reached, 82c for September after starting at 80⅝@80⅞,and with December up to 83¼ from the opening at 82 to 82⅛. At that point there was some selling for outside account, and the close showed a net gain for September of 1c, at 81⅜@81½, with December up 1 to 1⅛ at 82⅞@83. There was but little corn offered for sale. A general demand developed with traders, and the close showed September up ⅞ at 52⅝, after starting at 51⅝@52, and selling up to 52⅞. December closed ⅞c higher, at 51⅝. Oats were active and strong. September closed ⅝c higher at 35½, and December ⅜ to ½c better, at 33¾@33⅞.

Cash quotations were as follows: Flour was steady; No. 2 spring wheat, 85@87; No. 3, 80@84; No. 2 red, 80⅝@81¾; No. 2 corn, 52½; No. 2 yellow, 53¼; No. 2 oats, 34; No. 3 white, 36@38; No. 2 rye, 52@52⅝; good feeding barley, 48@49; fair to choice malting, 52@60.

New York General Market.

NEW YORK, Sept. 2.—Wheat—Spot firm; options closed firm at 1 to ½c net advance. May closed 89⅜; September closed 88⅝; December closed 88⅜. Hides firm. Hops firm. Pertoleum steady. Wool quiet. Coffee, spot Rio quiet. Sugar, raw firm; refined firm.

Grain Movements.

Articles.	Receipts.	Shipments.
Flour, barrels	31,000	21,700
Wheat, bushels	153,400	11,700
Corn, bushels	443,100	283,000
Oats, bushels	259,750	171,400
Rye, bushels	85,000	......
Barley, bushels	47,300	900

On the Produce Exchange today the butter market was steady; creameries, 14@19; dairies, 13@17; eggs, firm at mark, 14½@17½; cheese, firm, 9½@11⅛.

LIVERPOOL GRAIN.

LIVERPOOL, Sept. 2.—Close—Wheat, September, 6s 6¾d; October, 6s@6⅝; December, 6s 6d.

Chicago Live Stock.

CHICAGO, Sept. 2.—Cattle—Receipts, 22,000; steady to strong; good to prime steers, 5.35@6.10; poor to medium, 4.00@5.25; stockers and feeders, 2.50@4.30; cows, 1.50@4.50; heifers, 2.00@5.00; canners, 1.50@2.60; bulls, 2.00@4.50; calves, 3.50@7.00;; Texas-fed steers, 3.25@4.50; western steers, 3.25@4.45. Hogs—Receipts today, 25,000; tomorrow, 28,000; steady; mixed and butchers', 5.20@5.85; good to choice heavy, 5.35@5.70; rough heavy, 5.50@5.80; light, 5.40@6.05; bulk of sales, 5.20@5.60. Sheep—Receipts, 30,000; sheep and lambs steady; good to choice wethers, 3.10@4.85; fair to choice mixed, 2.25@3.00; western sheep, 2.75@4.10; native lambs, 3.50@6.00; western lambs, 4.00@5.10.

California Dried Fruits.

NEW YORK, Sept. 2.—The market for evaporated apples is more or less unchanged; common, 4@5; prime, 5¼@5¾; choice, 6@6½; fancy, 6¾@7½. Spot prunes remain steady to firm at from 3¼@7c for all grades. Apricots firm; new crop, choice, 9¼@9⅝; extra choice, 9⅜@10⅛; fancy, 11⅛@11⅝. Peaches are firm; choice, 7½@7¾; extra choice, 8.

CITRUS MARKETS

ORANGE AND LEMON MARKET.

The markets during the past week have been quiet; the supply at auction markets has been equal to all requirements and prices have ruled low on account of large quantities of deciduous fruits and poor quality of many of the orange going into these markets. The demand at this season of the year is for fancy fruit, and the quality of fruit has not been such as to supply the needs or attract the trade. The quantity in sight is slightly decreasing under the influence of lighter shipments from California and few diversions from western points. The Western markets have been quiet, taking but a small quantity of fruit. The light shipments going forward have been quite sufficient for all demands. The average shipments of eight or ten cars a day should, however, meet with fairly satisfactory prices.

The lemon market has improved somewhat, old stock having been cleaned up and there is quite a fair demand for Californias, especially 300 size, fancy and extra choice grades. The shipments have been light and a fair demand exists for all desirable cars in sight. Off sizes and poor keepers are not wanted.

Shipments of citrus fruits from Southern California for the season, from November 1, 1902, to date, are 21,772 carloads, of which number 2558 carloads are lemons.

AUCTION SALES.

NEW YORK, AUGUST 26.

Market steady.

D. M. Fr. Ex., Iris Valencias, $3. Violet, $2.35. Primrose, $1.45.

RAISIN PRICES.

Prices so far fixed by the California Raisin Growers' Association for the coming crop are as follows: Two-crown, 6 cents per pound; three-crown, 6¼ cents; four-crown, 6¾. The above prices are for raisins packed in fifty-pound boxes, f.ob. to a common shipping point. These prices, it is estimated, will net the growers five cents in the sweat boxes. A few local growers have already sold outside the association for 3¾ cents and better.

These are the highest prices ever named on raisins.

Last year within two weeks over $12,000,000 worth of timber and other property was destroyed by forest fires in Oregon and Washington. This enormous loss occurred upon a restricted area and represents only a very small part of the annual loss from this source. Every timbered region of the United States suffers year after year from fire. The annual loss is estimated at from $25,000,000 to $50,000,000. Forest fires have been regarded as almost inevitable, and few systematic attempts have been made to prevent or control them.

This country supplies five-sixths of the cotton used in British mills.

Pomona cannery pays out about $1700 per week for the pay roll.

The Wickson plum is selling this year in the east for more than any other plum.

The Santa Rosa Cannery has put in a new cooker and Climax Automatic Capper.

Millions of toads covered the ground for miles on August 23rd at Ogden, Utah.

The California Peach-Root Borer

While in Sacramento last week, we came in contact with E. M. Ehrhorn, Entomologist of Santa Clara county, and found that he was making an extensive study in the State Library, of the peach root borer. Mr. Ehrhorn has been noted as one of our closest students of insect life, and has turned his information to good account in helping the fruit growers of Santa Clara valley to eradicate the various pests of the orchards and vineyards.

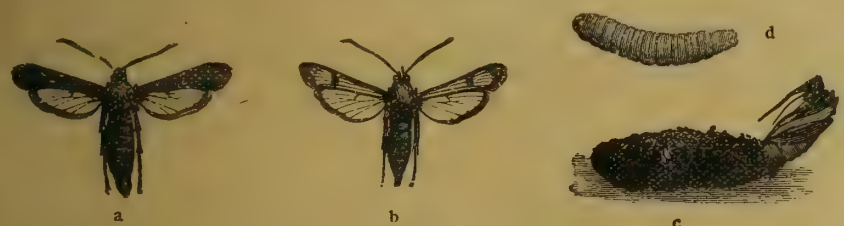
The peach root borer (Sanninoidea opalescens) is a native of California, which is contrary to the case with most of the injurious insects of the state, and the borer is different from that of the species which does considerable damage to the peach orchards of the East. If the pest is a native of this state, it is entirely probable that it has a natural insect enemy which must prey upon it in the immediate neighborhood where it originated. Whether the natural enemy can be discovered and made of use to the orchardists remains to be seen, but if it can be, it will be a means of vast saving of the peach trees of the state.

It is only since 1888 that this pest has been known to injure the peach. Doubtless it was engaged in the work long before that, but its work was not sufficiently wide spread that it attracted attention.

The moth is seldon seen and the habits of larva and pupa are but little known.

Owing to the fact that the present time is the best season of the year for fighting this pest, we give this week some quotations from Mr. Ehrhorn's report on this pest, which is illustrated with cuts used by the courtesy of the State Board of Horticulture.

"Egg.—The egg is very minute, not exceeding ¼ mm. in length, oval, light brown in color, and, when seen through a lens, ornamented with hexagonal sculpturing. The eggs are deposited on the bark of the tree, at or near the surface of the ground; rarely they are laid high up on the trunk or even in the crotches of the tree.



a b c d

FIG. 1. Peach-Root Borer. (a) Female. (b) Male. (c) Pupa, (d) Larva.

"Larva.—The larva, on hatching, are very active and immediately burrow into the tree, generally entering the cracks in the bark at or below the surface of the ground. Here they remain, constantly feeding on the bark, at first near the surface, surrounding themselves with gum, or coagulated sap, and gradually enter the sapwood, enlarging their burrows as they increase in size. The full-grown larva (Fig. 1 d) is a pale yellow, about one inch long, tapering, with a brown head. After attaining its growth, the borer ascends in the burrow to or above the surface of the ground, as the case may be, and begins to spin a cocoon.

"The Cocoon.—This is made up of a silken web mixed with castings and earth glued together, and is of a brown color, from 1¼ to 1½ inches long. (Fig. 1, c.)

"Pupa.—The pupa within the cocoon is shiny, light brown, with numerous spines on the abdomen. When about to emerge the pupa is pushed out of the cocoon, as in Fig 1, c, and soon the adult moth emerges.

"The Moth.—To the novice this insect would appear more like a blue wasp than a moth. The female (Fig. 1, a) differs so much from the male (Fig. 1, b) that they might be taken for two distinct species. The female has bluish-black, opaque front wings, while the hind wings are transparent, like those of a wasp; the margin of both wings has a bluish-black fringe; antennae, head, thorax,and abdomen are very dark steel blue, almost black; wing expanse, 1½ inches. The male (Fig. 1, b) has forewings nearly transparent, with upper margin and tips black; hind wings are transparent, like those of female; the body is bluish-black; the abdomen is much narrower than that of female and more elongated; legs are black, with yellow tufts on femur and tibia; wing expanse, 1¼ inches.

"This insect differs very much in looks from the eastern peach root borer.

"The food plants of the California peach-root borer, when first discovered, were the peach and cherry root, but it will attack peach, almond, apricot, cherry and plum roots, although the plum root (Myrobalan) is not so badly attacked as the others.

"In regard to the development of the insect, from the egg to the adult, we are as yet somewhat in the dark. The Eastern species requires one year to complete its life circle. I believe the California species does the same, but our climatic conditions and the variety of food have caused the insect to have several broods.

"This pest spreads in various ways, but probably the most common method is in the transportation of infested nursery stock. It behooves the grower to be very particular in this respect, and those who are planting peach, plum, prune, apricot, almond, or cherry trees, should examine all trees carefully before planting, for if once the pest gets a foothold in a new locality it will soon spread, at first very slowly, but fast enough to cause great expense and much annoyance. This spreading is done by the female, which is very active and flies readily and swiftly, but does not fly a very long distance.

"The Peach-root Borer's Life.—This insect, like most other insects, begins life as an egg. These eggs the female lays probably in a few hours after copulation, and they are laid singly and in groups, in all sorts of places, at or near the surface of the ground on the bark of the tree. A female moth may lay from two hundred to five hundred eggs, but fortunately not all hatch, many perishing through some cause or other. In the Eastern states it is claimed that the young larva hatches in from eight to ten days after egg-laying. In California this has not yet been observed, but probably it takes about the same time, although I believe that climatic conditions have a great deal to do with the length of time.

FIG. 2. Work of a single borer in a peach tree; natural size; (w b) burrow of borer; (g) gummy mass; (p) pupa projecting from cocoon. (After Slingerland.)

"The young borer begins feeding from the outside bark, generally starting in minute cracks, and gradually works its way to the sapwood where it increases in growth and makes its burrow. Here it remains for from ten to eleven months, doing great damage to the bark, and when numerous larva are present, often causing the death of the tree. Large quantities of gum collect on the bark about the burrows, and this is a sure indication that the pest is present. During the cold winter months the larvae do not grow much, but as soon as the sap begins to flow, they grow rapidly and soon attain their mature state. They then begin to ascend in the burrow and get near or above the surface line and spin the cocoon, which is still hidden in the burrow or under a piece of dead, loose bark. Before the larva makes a cocoon it bores an exit in the bark, near which it starts to spin. Soon the larva turns to a pupa within the cocoon, and, depending on climatic conditions, remains dormant for from ten days to four weeks. When the pupa is mature, it moves itself, by the aid of the spines on the abdomen, out of the cocoon enough to project half its length (Fig. 1, c) so as to allow the moth, which is very delicate, to emerge without difficulty. The moth soon bursts through the pupa skin, which splits down the center of the back for a short distance. After carefully drawing out its legs and by aid of these its body, it may crawl a short distance and rest until its wings expand and dry. It is then ready to fly off and find its mate. After mating, the female soon lays the eggs, as stated above, and its life circle is completed. It is very easy to tell whether or not the moth of the peach-root borer has hatched in the orchard by the empty projecting pupa skins. (Fig. 2, p.)

Methods of Destroying the Pest.—As the larva or borer (Fig. 1, d) presents the most vulnerable stage of the insect's life, the most successful attack is made at this stage. The methods for fighting it are twofold, viz.: preventive and destructive. In discussing these methods it will be well for us to begin with the latter. The destructive measures used against the borer are either the tedious way of digging it out with a knife or chisel or with an especially made instrument (Fig. 3), or by use of strong washes applied to the trunk and roots below ground, or by the fumes of carbon bisulphide.

"The Digging-out or Worming Method.—The digging-out or worming method is no doubt the surest way to know that the borers are killed, provided that good conscientious workers can be had. The best time to do the work is in November or December. The soil, which should be moist enough to crumble, is removed from around the tree and the bark scraped free from all clinging materials, such as gum and earth. With a knife or chisel, or, still better, the regular tool (Fig. 3), composed of hook, scraper, and chisel, the search for the borer is made. First find a channel and follow it up or down, using the hook, and locate the borer. Make a thorough search for every one until you are satisfied that all borers are out of the tree. Care should be exercised not to take too much bark off—only necessary quantity to get the borers out. The trees may be left open for a few days, especially if moist weather prevails, and then can be covered up until spring, when some preventive may be used. Some growers have dug for borers twice a year, generally in May or June, with good results. Shallow-rooted trees are attacked more severely than trees planted deep; and trees with root-

APPLE GROWERS' ASSOCIATION.

A meeting of the members of the Apple Growers' Association of Los Angeles county, will be held at room A in the Court House at Los Angeles on Saturday, September 19, at 10 a. m.

The programme will consist of a paper and discussion on "Harvesting the Apple Crop," better methods of picking and packing and the relation that these methods may have upon the keeping qualities of the fruit.

FRED'K MASKEW, Secy.

THE STOCK PARADE.

The cattle parade at the State Fair last Saturday was an attractive and instructive feature. It had in it a lesson as to the possible future of the live stock industry of the state. It indicated the great development which we believe is coming. The Almo herd of Governor Sparks of Nevada is an example of what careful breeding can do for Herefords. The Chowchilla stock farm and Joe Marzen of Lovelock, both had magnificent exhibits of Shorthorns. N. A. Chisholm led out some fine Jerseys, and of Holsteins Mrs. Gubbay and Mrs. Burke of San Jose, both made fine exhibits. In horses some of the most magnificent Percherons, French Perchrons, coach horses, roadsters, and on down to Shetland ponies, were exhibited.

While there was some disappointemnt as to the interest, or rather lack of interest, manifested on the part of the farmer, yet there is much of encouragement in this year's fair. It was universally conceded to be the best stock exhibit in many years, and while the bookmaker was one of the principal features on the fair grounds, yet the exhibit of stock was such that there is proimse of great good.

We hope next week to give a number of illustrations of the stock exhibited at the present state fair, photographs of which were taken by the Cultivator photographer. There is no question that there was some beautiful stock exhibited.

THE GAMBLER AT THE FAIR.

For a few moments last Saturday the writer mingled with the gambler, the book maker and the beer seller at our State Agricultural Fair. Prior to that few moments a good full day had been spent in looking at some as fine stock as was ever gathered in this state of Herefords, Shorthorns, Jerseys, Holsteins and many other cattle. Percherons, Clydes, French coach, runners and trotters; and a long list of pure bred swine and sheep. It was an eye-opener as to the resources and the live stock development of the state. It was a genuine pleasure. But to stand and watch the faces of the jostling crowd about the book-makers stands, one can not help but ask "are these agriculturists and is it for this that the state appropriates money?" There were some faces like that of the typical tough with blear eyes and swollen face, others less so, and many faces, which indicated a degree of refinement, but no agriculturist.

It is a pleasure, it is an inspiration, to witness a test of strength or of speed in horses. The rivalry it has inspired has given the two minute, instead of the three minute horse and the Percheron and other magnificent draft animal instead of the scrub. Yet the odium which has become attached to a test of speed in horses is such that a man of ordinary sensitiveness, and who is usually truthful along other lines, will instantly and emphatically lie, rather than to admit that he was at a "horse race."

Just such scenes as that at this fair is responsible for this feeling.

It is claimed that a fair is not a success without this element to make it so. But in California it has been fully tested and after years of failure the state was compelled to liquidate $45,000 deficit. This year the promise was for an agricultural fair. It was partially fulfilled. In face of the total failure of the former management, it will be wise if the tax payers will insist that an exhibition of the state's resources be given as thorough and complete a test as that of the "fairs" of the past.

This is not written from the standpoint of the moralist but as purely business matter in which we believe the tax payers do not wish to appropriate funds to support practices which are made criminal in many cities in this state.

CALIFORNIA PURE LIVE STOCK ASSOCIATION.

One good result of the State Fair this year which will doubtless prove of far-reaching good was the formation of an association whose object "shall be to foster and encourage the improvement of live stock, to secure large and meritorious exhibits of pure live stock at the state fairs and to hold pure-bred live stock exhibition at such times and places as the Board of Managers shall select."

The preliminary meeting of the live stock breeders who felt the necessity of some such move, if the campaign for education is to be made as to the merits of pure-bred stock, was held in the Golden Eagle Hotel on last Saturday evening. General discussion of the needs of such an organization was had, and without dissent it was determined that the breeders should stand together in this matter. The promoters are E. W. Howard, Dr. C. H. Blemer, State Veterinarian, N. A. Chisnolm, Jas. Whittaker, Isaac Bird, Chas D. Pierce, and many other representative breeders.

On Monday evening a much larger meeting was held in the Directors' room of the State Fair Association, when a large number of stock breeders from all parts of the state entered heartily into the permanent organization of the association. Breeders of all classes of beef and dairy cattle, draft horses, carriage horses, hogs and sheep were represented in the men who entered into this organization. E. W. Howard of San Mateo was elected president, and N. A. Chisholm of Jacinto, secretary. The president was empowered to appoint directors who shall hold office for one year. The following committee of five were elected on by-laws and constitution: Fred H. Burke of San Francisco (chairman), Judge Peter J. Shields, Guy H. Miller of Riverside, Isaac Bird of Merced, and Prof. E. W. Major of the University of California.

CHIEF FORESTER.

Last week Gifford Pinchot, chief forester for the U. S. Government, visited Los Angeles for the second time and met with a very enthusiastic reception. Mr. Pinchot stated at a public meeting held in the Chamber of Commerce that he met with a better reception in Southern California than in any part of the Union. This is due, he said, to the fact that our people are more fully alive to the importance of forestry as it affects water supply. "In the San Gabriel valley, for instance, the water is being pumped from a supply which has taken hundreds of years to accumulate The time will doubtless come when this will be exhausted and the people will have to depend entirely on the annual rainfall, which must be stored in reservoirs and saved in every possible way."

Almost every one is aware how much the Forestry Bureau can do for us in the matter of water supply and their work is largely along three lines: First, preventing forest fires; secondly, replanting burned over tracts and lastly to plant bare hills and mountains with suitable trees and shrubs.

Speeches were made by several persons who have made the subject a special study and among the happiest was one by Abbot Kinney of Los Angeles; he seemed to be thoroughly acquainted with the minutest details of the work and his speech met with hearty applause by those present and was later favorably commented upon by Mr. Pinchot. His talk brought out the fact that our immense San Gabriel Forest Reserve had no roads running through it and comparatively few trails leading in. All the trails are private rights of way and as the living of the owners depend upon forest preservation, they are all deeply interested in the work. Mr. Kinney proposed placing in the hands of such persons books of permits which they would issue free to all applicants. In this way all persons who entered the reserve could be traced, as to time, route, etc., and those who left fires burning be quickly brought to the bar of justice.

Mr. Pinchot stated that Ralph S. Hosmer, of the Bureau of Forestry, with headquarters at Pasadena, was stationed in the local field, with a corps of able assistants and would, before winter sets in, have made a thorough investigation and study of all local forestry matters and that in the near future we should see and hear much more from their bureau. Mr. Pinchot further stated that, in his opinion, the U. S. Government would have to buy back forest lands at an enormous expense, and advocated the awakening of public interest in the subject that some action might be taken by the government while the lands could be procured at a nominal price.

The meeting was attended by many of Southern California's most prominent citizens and the interest was at least a hundred fold that manifested upon the occasion of Mr. Pinchot's last visit to this city.

IRRIGATION CONGRESS.

The Irrigation Congress will convene at Ogden next Tuesday morning. It is said that the exhibits of results of irrigation is bringing together a display which is worthy a State fair. Amongst the things offered are four 22-pound solid silver cups, valued at $500 each, offered for the best exhibit of fruit, hops, barley, and sugar beets besides these many smaller prizes.

Governors of five states will be present and many of the most representative men of the West.

Referring again to the item which appeared in the issue of a few weeks ago regarding the magnificent showing of American poultry of the Australian egg laying contest, we wish to give credit to the Petaluma Incubator Company for their work in gathering and forwarding the pens from which these birds were chosen. The Incubator Company was at much expense in gathering these fowls and only their interest in the American fowl impeled them to make the exhibit.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

GLOATING TRADES JOURNALS.

As might have been expected, the New York Journals representing the fruit commission merchants, have lost no time in spreading the news of the withdrawal of the San Bernardino County Fruit Exchange from the parent organization, and a Northern California fruit journal helps to spread waht it evidently considers glad tidings of the breaking up of the Exchange. Each of these trade journals, whose advertising columns teem with the advertisements of the commission merchants, comment editorially upon the alleged disruption of the co-operative marketing plan as if it were a sweet morsel rolled under the editorial tongue. One of these trades papers is the official organ of the "National League of Commission Merchants of the United States," and is not expected to champion in this case the growers' cause, or to support broadly the principles of co-operation that have knocked the spots off the commission men who formerly sold the oranges of California. We scarcely expected to see a San Francisco fruit paper, published ostensibly in the interest of the fruit producers of the state, brazenly rejoice at the prospective dissolution of the co-operative plan and advocate turning the citrus crop back to the tender mercies of the commission men. But these organs of the commission graft must earn their pay, and we cannot criticize them for obeying their masters. Rather should the orchardist learn, from these leading anti-co-operative editorials, bleeding in every line with commiseration for the commission-man-out-of-a-job, that the first break in the ranks of the growers will be the signal for a snake dance among the subservient trades journals.

But here occurs just a little damper upon the glee of the commission merchants' organs. The "facts" upon which the editorial cannon were planted turn out to be not facts at all, but the purest of fiction, for the San Bernardino County Fruit Exchange has returned to the fold, or, rather, failed to leave the fold. Ere the ink was dry upon the excellent editorials the Exchange was making arrangements to market, in connection with the Citrus Union, 90 or 95 per cent of the oranges of California, including every box under control of the San Bernardino Exchange.

Our opponents have peaked forth their exultations too soon for their own credit. To be placed in such a ridiculous light as rejoicing over the misfortune of the great body of orange growers and then find that there has been no ill fortune of disintegration befalling them is indeed humiliating. But the newspapers in question have not sustained this humiliation alone. There are scores of commission merchants who will be sorry to learn the truth about the matter, and will curse their organs for premature announcements that raised the hopes of the dealers to the point of almost feeling the cold coin that would accrue to them as handlers of California citrus fruits. There are also a few local growers whose hopes of a "scrap" are blasted by the action of the San Bernardino county co-operators, and perhaps a great many broken down speculators, jobbers and hangers-on to the local trade whose methods long since relegated them to the rear. But the great mass of citrus fruit growers are rejoicing today that co-operation is now more firmly seated than it has ever been before, for the late ripple has demonstrated that the producers cannot be stampeded or persuaded to let their mutual organization perish, or even become weakened in the face of the terrible odds the trade would be able to array against the individual grower should he ever have to stand alone. So let the scare-head titles to those editorials, "A Break in the ranks," and "Discontent Among the Citrus Growers," be set aside for the auspicious occasion which all believers in co-operative effort hope will never come.

GENERAL NEWS NOTES.

The grape crop in Western New York is reported to be less than 40 per cent of a full crop. This is the nearest to a failure that region has ever experienced.

The American Sugar Refining Company has for some time been quietly buying up stock of the various sugar factories. They have now secured the control of nine which will soon be put under one management.

The Montana State Agricultural College believe they have solved the grasshopper plague. They recently distributed among the ranchers a poisonous fungus which literally exterminated millions of grasshoppers.

The bureau of forestry has begun the task of creating a forest on the barren sand hills of Nebraska. An experimental sowing of 100 acres with red cedar and jack pine will be made this year and if successful an additional 1000 acres will be seeded next year.

England has issued a patent to a gentleman who has discovered how to manufacture silk from wood. Experts only can distinguish the fabric from genuine silk. It weaves nicely and takes coloring readily. Any kind of solid wood can be used.

German bidders were awarded the contract for the supply of thirty locomotives for the Japan railways. American bids were 20 per cent higher than German. This is accounted for on the ground that prices of American steel are higher than German because of the Trust prices.

An independent packing company has been formed by cattle men of the west. It will be incorporated under the laws of Arizona and the capital stock will be $5,000,000. It will establish packing houses at Kansas City, some city in Texas and another at some other point, not yet agreed upon.

Truman G. Palmer at the Trans-Mississippi Congress, said: "We on the Pacific Coast can produce to perfection any temperate zone crop. We can grow sugar beets enough to furnish America all the sugar it can consume and thus annually save $250,000,000 that now goes abroad for sugar, but we are handicapped by high freight charges—so high we cannot put our products into eastern markets.

The Missouri State University has inaugurated a traveling agricultural school. A passenger car has been fitted up as a lecture and exhibit hall. Half a dozen lecturers accompany the car and deliver lectures along the line of the railroad. A stereopticon is used to assist in the demonstrations, showing methods of farming at the State Experimental farm. Specimens of grasses, grain and fruits are carried along and exhibited.

E. I. Kennedy of this city has returned from a two weeks' trip to Watsonville, and while there made an investigation into the apple industry of the Pajaro valley. He says the codling moth has, by spraying this season, been nearly eradicated. The damage will not amount to over 5 per cent, while last year there were about 40 per cent of wormy apples. The crop this year will be immense. We have forgotten how many thousand boxes he reported. Prices are good and the demand can not be supplied. The best, full bearing orchards are held at $2500 per acre, and the crop this season is paying big dividends on that valuation. He cited two sales of this season's fruit on the trees, one was a 40-acre orchard, 50 trees to the acre, mostly Bellflowers, which brought $7.80 per tree. Another was a 20-year old orchard of 80 acres, which brought $500 per acre for the crop. Besides apples this valley will have a big output of strawberries, prunes and potatoes. Of the latter there is an acreage of 2000, which will yield an average of 100 sacks.

At Monrovia last Saturday the Duarte-Monrovia Fruit Exchange held their annual meeting. The reports showed the total amount of oranges shipped as 298 cars. The net amount paid to growers was $89,518.78, after all expenses were paid. These figures were mostly for the seedling fruit. The returns from Valencias, of which there were 35 cars, are not in yet. The business of this Exchange was 25 car loads more than for the previous year. The question of opening a packing house in Azusa, by the Exchange, was discussed but not acted upon.

Coast News and Notes

By R. A. Dague, 1130 Eddy St., San Francisco

The San Jacinto Cannery is making a very heavy pack this year.

The new prune evaporator at Corning is complete and ready for work.

The people of the East will pay over $4,000,000 for California deciduous fruits this year.

Two gangs of fumigators and one spraying outfit are after the black scale around Ontario.

California last year produced 5,187,518 barrels of petroleum, a gain of 59 per cent over 1901.

The Riverside Vineyard Company has 2000 acres of wine grapes, of which 1300 are in bearing this year.

Up to September 1st Riverside shipped 4615 cars of oranges, and 237 cars of lemons this season.

Government surveyors are at work measuring the Sisquoc and Santa Maria rivers for irrigation data.

On September 15th the Chino Sugar Factory will pay about $90,000 for the first month's delivery of beets.

Washington farmers are holding their wheat for 75 cents. Some insist the price will go to $1.00 per bushel.

Quite a quantity of manganese ore is shipped from Alameda county to New Jersey and used in the production of steel.

The recent floods and rain storms in Kansas damaged crops and property to the amount of half a million dollars.

The crop of apples for the Pajaro Valley for the season of 1903 is estimated at 1450 cars. The crop for 1902 was 975 cars.

After the fruit growers of Los Gatos organized a co-operative association the price of green prunes soon advanced from $17 to $25.

A big land sale at Glendale took place last Saturday. Dr. and J. P. Scott of Redlands, bought 150 acres of land from Hugh Glassell.

The second annual convention of the National Nut Growers' Association will be held at New Orleans, Louisiana, October 28 and 29.

Potatoes in the Yakima valley, Washington, promise to exceed any former crop. Last year Washington produced 4,455,000 bushels.

A sardine cannery has been established at Monterey, and it is thought that during the season 150,000 one-pound cans will be packed.

The enthusiasm continues over the recent movement originating at Courtland to maintain a co-operative selling association of fruit growers.

Recent heavy rains in France have injured the wheat crop to the amount of $60,000,000. The vine growers complain also of serious injury to grapes.

Up to August 28 the total shipments of fruits passing through Sacramento were 4379 carloads, being just the same number as last year on the same date.

The picking of 500 pounds of hops per day is a good day's work, but Ameil Weselsky, of Ukiah, enjoys the distinction of being able to pick 733 pounds.

In the mountain sections of Santa Clara county prune gathering is under way. The fruit is large, but the yield is much below estimates made a few weeks ago.

The editor of the San Francisco Chronicle says Nebraska is the only state that can be considered as a competitor to California in the production of sugar beets.

The Crockett Sugar refinery is now in active operation. Last week twenty-five more men were added to the pay roll. Large quantities of beets are being shipped in.

The apricots of Ventura county, estimated at about 2,000 tons, are about all dried and in the warehouses. Growers are expecting to get about eight cents for the fruit.

Very little wheat has been delivered at Port Costa in the past three months. Considerable barley is now arriving and most of it is being loaded on ships to be sent to Europe.

The salmon packing season is about over and it is estimated that there will be an aggregate shortage of nearly 2,000,000 cases for the world as compared with last year.

Already 400 carloads of grain have been shipped out of Hemet, San Jacinto and Temecula section, and this is hardly a starter on the season's crop.

The eleventh annual convention of the National Creamery and Buttermakers' Association will be held at Sioux Falls, N. Dakota, October 12th to 23rd.

The San Joaquin ranch this year will produce about 80,000 sacks of Lima and black-eyed beans. Limas are contracted at 3¼ cents per pound and black-eyes at 2¼ cents.

County Assessor Dalton assessed the fruit lands this year of Alameda county at $200 per acre. The best garden lands near San Leandro and Haywards were assessed at $500 per acre.

The big new Stern winery at West Riverside opened for business last week. The plant has a capacity of 200 tons of grapes per day, with a tankage capacity of 500,000 gallons.

It is reported in New York that the new crop of California beet sugar was being offered to Missouri points at a price 10 points below the minimum price named by cane sugar refiners.

The two greatest oil fields in the world are those of Kern county, California, and Baku, Russia. In Asia the cost of boring and casing a well is $30,000. In Kern county about $3000.

Charles Krausse, of Sonoma county has on exhibition at the Santa Rosa Board of Trade rooms, samples of a plum which are new to other fruit growers. The fruit is large and of pleasant flavor.

The annual meeting of the Claremont Citrus Union was held last week, and it was decided as better policy to destroy all citrus culls rather than put them on the market with merchantable fruit.

The Washington wheat crop will be smaller this year than last. The figures of this year's crop of winter wheat are 5,498,700 bushels and the spring wheat between ten and twelve million bushels.

The annual report of the Redlands Orange Growers Association on the business for the past season showed that 471 cars were shipped; the gross receipts were $233,051, and of this $180,458 was net.

Hop picking is now on. It is estimated that in Mendocino the crop will run about three-fourths of that of last year. The price will go from 25 to 30 cents, which means over $400,000 for the hop crop of that county.

The annual report of the San Antonia Fruit Exchange showed that 357,698 boxes of oranges and 41,971 boxes of lemons were shipped during the past season. The net receipts to growers average over $1.25 per box.

The State Agricultural Society some years ago introduced into this state the Chile clover, commonly called alfalfa. Stock men testify that it is the most valuable forage plant known at the present time for dairy and stock interests.

The citrus crop in Tulare county is reported to be in good condition, and will come on the market earlier this season than ever before. The prediction is made that this season's output will be nearly 1200 cars, as gainst 900 shipped last year.

The report has been current that the price of wine grapes will be low. This the growers contradict. Joshua Chawvel of Glen Ellen has been offered $15.00 per ton for his crop, but did not sell. Growers are holding for $18.

The Oregon Agriculturist last week gave an estimate on this year's output of dried prunes from Washington, Oregon and Idaho at not to exceed 30,000,000 pounds. The brown rot is quite extensive, and will cut down the otherwise large crop.

The grounds at the Experiment Station near Pomona have been enlarged by leasing thirteen acres from the Chino Land Company. This land will be used for experimental work in viticulture. Over one hundred varieties of grapes will be grown.

Hueneme Herald predicts that the crop of lima beans in Southern California this season will reach 663,000 sacks. Of this amount Orange county will raise 63,000, Los Angeles county 120,000, Ventura 400,000 and Santa Barbara county 80,000 sacks.

The wineries of Sonoma county are now prepared to handle this year's crop of grapes. They have very little old stock of wine on hand. M. Miglavaca is out contracting. He wishes to secure 1000 tons for his Napa winery. At this writing he is offering $15 per ton.

The directors of the Lytle Creek Water and Improvement Company have purchased from the Fontana Development Company their interest in more than half of the water of Lytle Creek. This will give the country west of Rialto water supply in great abundance.

The Union Pacific and Southern Pacific will again put into effect colonist rates from all eastern states to California. The rates will go into effect on September 15th and continue until November 30th. Last spring 40,000 people came into California on colonist tickets.

The United States Department of Agriculture is negotiating with the farmers of Ventura county for the purchase of a large plat of land upon which it is intended to establish an agricultural experiment station. The station will be devoted to the culture of flowers.

The Sutter County Almond Growers' Association have sold their crop of almonds to Rosenberg & Co. at the following prices: IXL, 10; Nonpareil, 10½; Ne Plus Ultra, 9½; Drake's, 8½; Languedocs, 8¼; Golden State, 8; Routiers, 8; Peerless, 9; Llewelling, 8¼; Commercial, 8.

About eighteen years ago Luther Burbank took a small French plum aboue the size of a cherry that grew on a rambling throny bush. He crossed and recrossed it with French and German and other prunes of Europe and America. The result was the delicious, seedless Miracle plum.

The Western Orchard Produce Company of London is a new organization composed of London and Riverside capitalists who propose to ship oranges direct from Riverside to London next season. They are preparing to land their fruit on the London market twenty days after it leaves the Riverside packing house.

California annually sells to the world seeds to the value of from two to three millons of dollars. We dictate prices to the world on onions, lettuce, celery, sweet peas and others seeds. The business is growing and this state bids fair to be the greatest of all seed raising countries in the world. At this time the greatest seed farms are in the counties of Sacramento, Santa Clara and San Joaquin.

Orchardists in this valley will await with deep interest the results of the tests made with hydrocyanic gas as a means of destroying codling moth eggs on apples. The apples were subjected to fumigation several days ago and the hatching process of the eggs if they still retain life, will be forced by means of artificial heat. The plan should prove the merits of fumigation as a means of overcoming the packing house trouble.—Pajaronian.

G. C. Hussmann, expert in viticulture from the U. S. Department of Agriculture, is investigating the vineyards of California. He says six experimental stations will be established in this state. There are now twenty-one nonresistant vines doing well in California. Next spring 250 varieties will be set out. They will come from France, Germany and Austria. The merits of the different resistant vines are hereafter to be closely studied. Prof. Hussmann wishes to correspond with the vine growers of the coast. Address him at Napa, Cal.

The United States let a contract this week to the San Francisco Construction Co. to construct a canal 32 miles long, fifty-three feet wide and fourteen feet deep. The canal will start from the Truckee river and run southeasterly through the Truckee and Carson valleys. The object is to reclaim 300,000 acres of arid land. 1700 men at $2.25 per day are to be employed, and they will be furnished board at 25 cents per meal. Three tunnels will be constructed, one of 400, one 900 and one of 1400 feet. The canal will cost $996,787.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so faras possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

(Continued.)

We remember that our quest in the great animal world has been entirely in the realm of the Arthropoda—jointed animals with jointed legs. The Crustacea or lobster class all breathe water, the Myripods have numerous joints and more numerous legs and feed on plants—Millipeds, or on insects—centipeds, in which latter case they are our friends. The Arachnida class—spiders—all have eight legs, all feed wholly on insects, and are wholly our friends. The great insect class—Hexapoda—are six legged, and are so multitudinous that they far outnumber all the other animal forms, and are so ubiquitous that we find them at every stroll, in every place. No shore is too bleak, no desert too barren, no water is too salt, no atmosphere is too torrid to harbor some of the species of this most varied and interesting class—insects.

We have spied out the characteristics of the Neuroptera or lace-wings. We have admired their large netted-veined wings, have marveled at their great strong typical jaws, have noted with surprise that low as they seem to be in structure, yet some—many of them. the Neuroptera proper—go through complete transformations, as seen in the exquisite chrysopa fly or green lace-wing, parent of the Aphis Lion. We have rejoiced to find that all of this order, if we except the white ants, are insectivorous and emphatically our friends. They are predaceous and eat up our insect enemies by the thousands.

Order Orthoptera—This word means straight wings, as the upper wings, or front wings, are, for the most part, long, slender and straight. These wings are also thick or parchment like, not so hard or horny as in beetles, nor do they so thoroughly sheathe the other wings. We are all familiar with the Orthoptera in the crickets, the grasshoppers, the locusts, the walking-sticks, the mantes and the cockroaches. Economically this order contrasts quite sharply with the Neuroptera, for here all are vegetable feeders, if we except the praying mantis family, and so all are our enemies, and no mean enemies are they either. We all know that locust plagues have been startling and terrible from times of earliest history, and today they lay a heavy hand on the product of orchard, garden and field. In these insects the large, broad-netted, veined hind wings are alone fitted for flight. The slim, thick front wings are mostly for protection. These are all biting insects. They eat and do not suck. Thus it was said in the olden times of the locusts, that they "did eat every green thing from off the face of the whole earth." So strong and sharp are their jaws that they can and often do, strip the bark entirely from quite large twigs and branches of trees. The "hateful grasshopper locust" of the west has been known to denude small fruit trees almost wholly of their bark, as many a farmer of Kansas and Nebraska remembers to his sorrow. The mouth organs of locusts are so well developed and so typical of mandibulate insects that we usually select them for study in our laboratories. We not only find the upper lip or labrum, the two pairs of side moving jaws, mandibles and maxillae, and the under lip or labium, but we find all the parts of each of these. Thus any boy or girl can acquire a very perfect knowledge of these typical mouth organs very easily and quickly by examining the same in one of our large common locusts.

The transformations of these insects are incomplete. Thus the little child would recognize the locust as soon as it hatches; and though it is utterly without wings, yet all would know it at once as a baby locust. The larger pupae look much the same, have the same habits of food taking, but as yet have only small stubs of wings. The imago is still larger, but looks much the same, and is possibly of the same general apearance, though now he is equipped with fully developed wings and is for the first time sexually mature. In our next we will study the separate families of this important order.

* * *

SEPTEMBER INSTITUTES.

The Santa Barbara and Ventura Institutes as occurring first under the new regime of a special appropriation for institutes by the legislature are of special interest. Praise was given on all sides. The people showed marked appreciation of the fact of so many specialists in the corps of instructors. Mrs. Sherman, whose ready answers to all questions on dairy subjects and grapes, elicited the remark, "Is there anything that she does not know," delighted all hearers. Dr. Sherman spoke most acceptably on Bacteria. Prof. Anderson, as always, was listened to with great pleasure. Frederick Maskew of Long Beach is full of valuable information and has a rare gift of speech, while in these walnut regions no one could draw so many eager listeners as Prof. N. B. Pierce, as he discussed the walnut disease. At both Santa Barbara and Ventura the Chamber of Commerce unanimously and most heartily extended invitations for the next Farmers' Clubs Institute.

* * *

WALNUT BACTERIOSIS.

Quite extended examination by Prof. Pierce and others seemed to show that walnut blight at Goleta was confined wholly to the immediate region of one small orchard. Prof. Pierce recommended that all the diseased trees be dug up and burned, in case a more careful and extended examination confirmed the statement of such close limitation. At Carpenteria and in the walnut regions of Ventura it is more extended, and in some orchards it is as serious as in the worst orchards of Orange. In rare cases from 50 to 80 per cent of the nuts are destroyed by the disease. While the disease attacks the twigs and leaves it does not destroy the tree, but works its terrible mischief in the ruin of the nuts. The disease spreads from the germs which winter over in the twigs, and in the ground. They are carried to the blossoms by insects, especially thrips, and to the tender twig growth by the common walnut aphids. Spraying twice by the Bordeaux mixture, once just before the leaves put out, and again just as the nuts are beginning to set, will surely save about one half the loss. Severe pruning back of all diseased limbs, which are easily seen from the obvious scars, will tend also to stay the disease.

Prof. Pierce has found that only the Persian walnuts are susceptible, and that hardshells and hybrids are largely or wholly immune. Thus he is working energetically and extensively to produce trees that shall have the excellence of the soft shell Persians and yet will wholly resist the blight.

* * *

THE SILO.

Mrs. Sherman, who has had such a wide and successful experience and who was the first to prove that alfalfa butter, even though the alfalfa was preserved in the silo, was the equal of any butter—indeed her alfalfa butter scored in an official test 98¾ points—is very pronounced in her advocacy of the silo. She says it increases the profits 33 1-3 per cent. She emphasizes the fact that the flavor and succulency of the food makes it appetizing and so enables the cow to utilize the food to the uttermost. Nor does she confine her silage to corn, though she gives it highest praise. She values alfalfa silage very highly and would always put the first cuttings with the redundant foxtail and weeds into the silo.

* * *

CARE IN THE DAIRY.

Mrs. Sherman urges that regularity in feeding and milking be most carefully observed. She insists that the best success only comes with the most gentle treatment. She never tolerates help that are ever harsh. Her insistence that clean clothes, for the milker, and that brushing and washing of cows before the milk is drawn, as indispensible if the best dairy product is to be secured, must have come as a surprise to many present.

* * *

HORTICULTURAL INSPECTORS.

Frederick Maskew gave in most happy manner such a vivid account of his work that all present must have been impressed with the value and importance of such work when in such careful, able hands. His experiments with the codling moth, spraying for the scale and in working out the habits of the immature Fuller's Rose beetle, are most entertaining. He urges the use of tobacco for the root form of the wooly aphis. He advises all to grow their own tobacco, hang it up to dry, and then just before the fall rains, dig a hole four feet in diameter close about the tree, put in a good supply of the tobacco and the work is done.

* * *

BEES.

Mr. McIntyre has made a great success with bees. His crop this poor year has been forty tons. The three sages, wild alfalfa of the mountains, and wild buckwheat furnish the native pasture. This is supplemented by orange bloom and alfalfa. Italian bees pure, or else a cross between the Italian and Carniolan are best for the beginner. The 10 frame Longstroth hive is by all means the best. The beekeeper should have everything convenient. His daughter extracted sixteen tons of honey this year by use of an automatic extractor of his own make, run by water power. In another apiary where the hand Cowan extractor was used the work was done by his daughter, in the other apiary cost $5 per day. Mr. M. would always use foundation in the brood chambers, and would produce extracted honey. The new honey exchange enabled us to secure a good price for our honey. It cost .04 to produce extracted honey. It ought to sell for six cents.

CARLOADS OF ASPARAGUS.

The largest aspargus farm in the world is located on Bouldin Island, near Stockton, California. It contains 3000 acre of asparagus in a single bed. On an average 325 carloads of canned asparagus, valued at $600,000 are shipped every year, and more than 600 persons are employed.—Sunset Magazine for September.

BEE POINTERS.

Persons owning bees and not located near streams of water should furnish them fresh water daily, as it will save time, which to the bees means honey, as it means money fo us.

When the young queen is out it is well to add a frame of eggs and larvae. This will furnish employment for the bees, and if the queen is lost on her bridal tour furnish the means of rearing another.

There is nothing that arouses the anger of bees and causes a quicker resentment than crushing them between combs and under hive covers. By useing some kind of mat over the frames a large part of this difficulty will be removed.

One who has never cared for bees should remember that bees, like animals, are very apt to return to their old homes if they are near by. In buying a hive get them some distance from where you wish to keep them or you may find them gone some day.

I have made the mistake of raising some very poor queens by giving the bees no unsealed brood whatever, except some just hatched, or eggs alone, and then supposing they could not raise queens from anything but very young larvae.—Exchange.

WALNUT BLIGHT.

The following circular is just received from Prof. Pierce, and while the treatment which is recommended is for spring application, we give it at the present time because of the intense interest which now prevails as to the blight which is costing the walnut growers an immense sum. While it is entirely probable that this formula for treatment will be repeated in the season when it will be of more immediate value, it is well worth filing away this paper, to be sure and have it when wanted.

Where failure has been had in the application of the Bordeaux mixture, we believe it can be traced to the careless mixing. This belief is founded on remarks made by several orchardists as to their methods of mixing, therefore we think it would be wise to follow the directions implicitly, for the most successful orchardists who have used this mixture refer to this same method of mixing.

The treatment recommended by Prof. Pierce for Walnut Blight (Pseudomonas juglandis) is as follows:

The following recommendations relative to the prevention of Walnut Blight or Bacteriosis are based upon several years of careful experiments by the United States Department of Agriculture. They are given to enable the growers of walnuts throughout the State to take advantage of the work of the Department on this disease so far as the experiments have progressed.

Preventive Measures.—(1.) All infected trees should be pruned carefully to remove branches showing the action of the disease of the previous year. Remove the dead tips of limbs especially those of last year's growth, cutting well back of the diseased parts. Also cut away small limbs which show the blackened scars of the past year's disease, where the organism causing the disease winters in the pith cavity. Burn all prunings.

(2) Spray the dormant trees thoroughly with the Bordeaux mixture. This work will give best results if done some two weeks before spring growth begins. All portions of the tree should be treated, special attention being given to the wood of the past year.

(3) Spray the trees a second time as soon as the nuts are firmly set, using the same spray and making a special effort to treat the young nuts upon all sides. The object is to protect the nuts from infection.

(4) Prepare the spray as follows:

Formula For Bordeaux Mixture.—
5 pounds of copper sulphate.
5 pounds of good quick lime.
50 gallons of water.

(a) Slake the lime in an oak barrel in a small amount of water. When perfectly slaked, add enough water to make 25 gallons of milk of lime.

(b) Thoroughly dissolve the copper sulphate in an oak barrel containing 25 gallons of cold water.

(c) Continue to pour one pailful each of the milk of lime and of the copper sulphate solution simultaneously into a third oak barrel, holding 50 or 60 gallons, until all of the two solutions are thus united. Stir the milk of lime as it is dipped out and pour it through a fine wire strainer into the mixing barrel.

(d) When the mixture in the third barrel is well stirred it will be ready to apply as a spray to the trees. Spray the trees while the mixture is fresh and stir the latter occasionally.

(e) The spraying should be done if possible when there is little or no wind.

(f) Use a spray pump which will maintain 120 pounds or more of pressure, and such nozzles as necessary to reach the highest limbs and do the best work over all portions of the tree with the least waste of spray.

NEWTON B. PIERCE,
Pathologist in charge.
Pacific Coast Laboratory and Plant Improvement Garden, Santa Ana, California.

The annual meeting of the Azusa-Covina-Glendora Fruit Exchange was held last Saturday at Azusa. The reports showed that 939 car loads of oranges and lemons were handled, which is the largest year's business, with one exception, this Exchange has had for the past ten years. Officers for the coming year were elected.

California Horticulturally

JOHN ISAAC, SACRAMENTO

A FINE ARBOREAL COLLECTION.

Probably the finest collection of trees in a single body in the state is to be found in the Capitol grounds in Sacramento. The hardy maple of the north, the magnolia of the south, the English oak and the tropical palm, are all growing here together, while the fact that all are doing equally well speaks volumes for California climate and conditions. There are here some of the finest specimens of their kind we have ever seen, and the collection compact, well-kept and well-grown, is an attractive feature of the capital city.

* * * *

FRESH FRUIT MEN DOING WELL.

It is cheering to know that prices for fresh fruits in the market still keep up, that the demand is good, that the growers and shippers have so far had a very prosperous season. Tokay grapes are being shipped in large quantities from Sacramento, where they attain perfection. This is a fruit crop that nearly always brings good returns. The grape is a very showy one, the berries are large and solid, and the bunches of great size. They ship remarkably well and reach the market in good condition. Their size and beauty always sells them. There is a steadily increasing acreage being planted to Tokays each year in Sacramento, and the vine is a free growing one, very hardy, being largely resistant, and the market is tolerably sure. It has always been, and probably always will be a good money crop.

* * * *

PACKERS SHOULD LABEL THEIR FRUIT.

The last session of the Legislature passed a law providing that all fruit packages should be labeled, stating where such fruit was grown, and making it a misdemeanor to ship or offer for shipment any fruit packages not so marked. This was for the purpose of securing to each locality the credit for the fruit it produced and to establish its just reputation with the dealers and consumers. It has been a customary thing in the past for jobbers to purchase the crop of an orchard in one section of the state and pack it in boxes as coming from an entirely different, but better known section. The result has been that many sections where superior fruit is grown are wholly unknown, while the products have gone to build up the reputation and increase the prosperity of sections which are not entitled to the credit. It was a species of small fraud, and the action of the Legislature in the matter was commendable. All packers should be guided by this law, the principal section of which is as follows:

"All fruit, green or dried, contained in boxes, barrels, or packages, which shall hereafter be shipped or offered for shipment in this state by any person, firm or corporation, shall have stamped, branded or stenciled, or labeled in a conspicuous place on the outside of every box, barrel or package in clearly legible letters at least one-quarter of an inch in height, a statement truly and correctly designating the county and immediate vicinity in which such fruit was grown."

Violation of this statute is a misdemeanor and subjects the offender to a penalty of $200 to $500 fine.

* * * *

FUMIGATE ALL YOUR STOCK.

In setting out a new orchard or vineyard, whether the trees or vines are infested or not, whether they come from an infested section or a clean one, it is a good plan to fumigate them with hydrocyanic acid gas. They may not need the treatment; if not it will do no harm, and there may, in spite of the greatest care in selecting and inspecting, be eggs, or young of phylloxera, woolly aphis, or other injurious insects, which from a very small start may gain a foothold and increase until they ruin the orchard and vineyard. It is little trouble to treat the young stock, as good a chance will never offer again, and when it is in bulk and out of the ground, the cost and trouble is little, and as a precautionary measure it is invaluable. A dry goods box, lined with building paper, will make a good fumigating chamber, and a very large quantity of young stock can be treated in a small space each time.

GOOD RESULTS FROM SPRAYING.

Reports from the Professors in the field fighting the codling moth around Watsonville, are still very encouraging. On trees that have been properly sprayed, under their supervision, there is said to be not more than 3 per cent to 5 per cent of wormy fruit, while on trees that have been left unsprayed for comparison there is about 50 per cent of wormy apples. Certainly the apple growers of the Pajaro Valley have received an excellent object lesson in the advantages of thorough and systematic spraying, and many there, who have heretofore refused to spray, have become firm believers in its efficacy and will attend to their orchards thereafter. We understand that Professor Woodworth is preparing a bulletin on his summer's work along these lines that should be a very valuable addition to our horticultural literature.

* * *

TROUBLES OF VINE GROWERS.

The phylloxera is making steady inroads in the vineyards of most of the northern counties until it is making grape growing, especially in the wine section, expensive and uncertain. All the new vineyards in these sections are being set out with resistant stocks and working all these over, and afterwards replacing the missed ones is a complicated and expensive process. Added to the phylloxera pest is the Anaheim disease, which is even more rapid and widespread, and which has obtained a foothold in most vine-growing sections in the north and is spreading with alarming rapidity. Prof. Pierce's discovery that the Le Noir is resistant to the Anaheim disease, is an important one, and may be the means of saving our vineyards. But it adds yearly to the cost of grape production and very materially lessens the vineyardist's profits, so that in spite of the present high prices of grapes, not a very large margin is left for the grower.
